12,392. (*Mr. Austin Bruce.*) Are there any intermediate draws ?—They are allowed to draw whenever they like. If any man wants a draw he has it, but the system with us is so well understood that the men very seldom require a draw. They can always procure during the month everything that they wish to have ; there is no difficulty at all. I should mention in reference to that that if we had experienced any difficulty whatever we should instantly have altered our system and made the pay once a fortnight ; but inasmuch as we have so many pays, including the iron furnaces, it is inconvenient to pay oftener than once a week, and therefore the pays are distributed every Friday, so as to bring in a certain class of the men once every week. The men at the furnaces are paid once a fortnight. I wish to mention one thing in connexion with that subject, namely, that for some years we had Saturday as the pay day, but we found that the men coming to be paid on the Saturday afternoon in their clean clothes went immediately to the public houses from the pay office in the town and got drunk, and remained drunk during the Sunday. After reflection it was determined that we would pay them on the Friday afternoon as they left work in their dirty clothes, and we have found that it has operated in a very marvellous manner in checking drunkenness, because the men are now disposed to go home at once, and they get their money taken possession of by their families instead of going to the public houses to drink it.

12,393. (*Chairman.*) Do the men come back to work on the Saturday ?—Always. I accompanied that with another rule, which was this. Feeling thoroughly satisfied that I could depend upon my men not leaving me for the penalty which I had determined to inflict upon them, I established a rule that any man who was absent from work either on the Saturday or the Monday after the pay day should be allowed to play for a week,—he was not allowed to come to work for the remainder of that week ; in other words, we inflicted the penalty upon him of the loss of the week's wages.

12,394. And you found it answer ?—Yes.

12,395. (*Mr. Holland.*) Very few incurred the penalty ?—None. When I say none, one perhaps in 450.

12,396. (*Mr. Austin Bruce.*) Then, in fact, there is no more drunkenness after pay day than there is at any other time ?—Just so.

12,397. (*Mr. Holland.*) Was that change effected without any grumbling on the part of the men, or with very little grumbling ?—I never heard anything of it. I believe that one or two did grumble a little. When I first established the Friday's pay the men were disposed to be absent on the Saturday entirely, and under the then rules they were fined half-a-crown for being absent from their day's work. I made a calculation by which I found that the loss by a man of his day's work, paying his fine of 2*s* 6*d*., and losing what he would earn during the time, and the money which he spent came to an average of about 10*s*. ; I then found that that 10*s*., divided over the whole of the ore which we raised, came to something like a penny upon what we call our pit ton (which is not an imperial ton); I immediately determined that I would knock off a penny from the wages, and I put it to the men that as they could afford to be absent in this way from drunkenness and to lose 10*s*., by taking a penny away from them, if they worked during that time they would just get such an increased quantity of ore as would give them exactly the same wages by working continuously as they had done previously, and that, therefore, they would be in exactly the same position, but without having the opportunity of spending their 10*s*. in drunkenness. I therefore determined to take this penny off from the whole of the mine, the effect of which was that I made the steady men so excessively angry with those who had brought the penalty upon them, that I created a moral influence and established a very wholesome system, which enabled me afterwards to carry out the other system which I have mentioned, of letting them stop away for a week, and I also succeeded at the same time in producing an economy in the working of the mine.

12,398. You turned the good men upon your side ? —I turned the good men upon my side. I had the curiosity to take out very carefully the men's wages prior to that reduction of a penny, and subsequently to that reduction of a penny, and in the following two months they actually earned a shade more on the average than they had done before the penny was knocked off them.

12,399. (*Chairman.*) Is there a doctor specially attached to the mine ?—Only for accidents.

12,400. Is there any club ?—The system with which we commenced our mines was this :—It was a rule of the mine that every man should contribute 1*s*. 6*d*. a month towards a club, and we took upon ourselves the responsibility of guaranteeing that that money should be sufficient for its objects, which are to give every

man 10*s.* a week when he is absent from the mine, in consequence of either sickness or accident, and in proportion to the severity of the cases where any accident may result in death, either a pension to the widow and children of 2*s.* 6*d.* to the woman, and 1*s.* 6*d.* to each of the children, or a lump sum, which would vary according to the circumstances and number of children, of from 20*l.* to 25*l.* given to the widow, so that in the event of her being a stranger, she might return to her own part of the country, or if she was a native, to establish her in some small business. We have found that answer very satisfactorily; so much so that we have hardly ever had a case in which the widow has been compelled to apply to the guardians for relief, excepting for a very temporary period; they have succeeded in getting established in some small business. Then I should mention that the reason why we have not a doctor for sickness attached to the club is this, that most of our men belong also to the Odd Fellows Club in the district, and inasmuch as that club provides them with a doctor, if we proposed to provide them with a doctor too, we should have to pay them less sick pay, and they would then be found with two doctors, which, of course, is not required; therefore the men themselves prefer their having the 10*s.* to being found with a doctor and 9*s.* only.

12,401. Is there any demand for education?—The system of education in this country has been excessively bad in this parish, in consequence of their being under the influence of an endowed school, which practically afforded no education and stopped all efforts which were made to get education established upon a proper principle; but under the new law which was passed a short time back we have been enabled to get the old trust put an end to, and we have now succeeded in getting schools built in the parish of Dalton at a cost of about 2,000*l.*, which will accommodate about 500 children. Those schools are now on the point of being opened, and we shall commence with their opening a system of charging every man 6*d.* a month, whether he has children or not, and undertaking to educate the whole of the children which those men may have, whatever their number may be.

12,402. (*Mr. Holland.*) Do the men who have no children complain of that?—Not at all. I may say that in future the facilities for education in the parish will be as great, I think, as in any parish in England; there will be accommodation for 1,200 children in the parish.

12,403. What is the population?—About 12,000.

12,404. (*Chairman.*) Do the men generally reside near the mines?—Taking the average, I should say that the distance which the men have to go to their work is about two miles.

12,405. In the Parks mine, have they far to go?—About two miles.

12,406. Do the men change their clothes there when they go underground?—Yes, at least they have the facilities for doing it if they wish to do so. We have a changing house, with means of drying their clothes, and hot water for washing; in fact, we have that at all the mines.

12,407. Do you think that the men appreciate it?—They do appreciate it, and a greater number of men every year are availing themselves of the opportunity of changing. I may mention one thing, which I believe has done more to improve the cleanly habits of the men than anything, and that is, the formation of a volunteer corps in the district. The effect which that has had upon my own men in particular is extraordinary; it has not only set them up and given them more care of their appearance, but it has induced cleanliness, which I find through the reports of our clergyman has extended into their houses, and in that way been productive of a very great moral effect, totally irrespective of other things.

12,408. In taking out the ore you use a great quantity of timber for supporting the superincumbent material?—A very large quantity indeed; the calculation which we make roughly is a foot of timber for all purposes in the mine for one ton of ore. I may mention with reference to that timber question, what, at first sight, may appear extraordinary, but it would be at once understood by anybody who entered the mines, namely, that the first height of workings is the safest, and the second height the most dangerous, for this reason, that the ground above has not got thoroughly crushed, neither is there a sufficient quantity of timber between the second height of workings and the ground to make a roof of timber.

12,409. (*Mr. Austin Bruce.*) You have not in fact so strong a buffer?—You have not so strong a buffer, but after you get down when there are many heights above the timber gets spread in every direction, so that it distributes the weight more equally upon the whole mass, and the timber does not crush to the same extent as it has previously done.

12,410. You have said that the most accidents which occur are from falls?—Yes.

12,411. What are the other sources of accidents?—Carelessness.

12,412. You employ, in round numbers, 500 men?—Yes.

12,413. What per-centage of accidents do you think, one year with another, you have?—About $\frac{1}{2}$ to $\frac{3}{4}$ per cent.

12,414. Do these accidents result occasionally in death?—Yes; our total number of accidents from all causes in the mines in 20 years have been 16 resulting in death; 5 from falls of ore, either in the roof or in what we call the fore breast coming out from the end, one from the powder firing in a bore hole in blasting before the man was prepared for it; in stemming the hole it went off and killed him; and there have been 10 accidents arising from causes entirely beyond the control of the masters and from the negligence of the workmen. The average number of men employed in those 20 years were 300 per annum, or 6,000 in the whole, so that it is 16 cases of death in 6,000 workmen employed; if we had employed 6,000 workmen for one year, there would have been 16 deaths in that one year.

12,415. You have agents who practically manage your works, or superintending them and visiting them occasionally?—Yes.

12,416. Do you ever have complaints made directly to yourself of the want of adequate ventilation in any portion of the pit?—No, and for this reason, that it is a very rare occurrence that we are deficient in ventilation, and in all the cases where there has been a deficiency of ventilation I have invariably found that the captains have instantly come to the head captain and asked for instructions as to what they were to do to obviate the difficulty. It only arises from this cause, that under certain circumstances where we are obliged to drive a level to communicate one pit with another, we experience a quantity of light air just at the end of the level as they are approaching the communication, but not under any other circumstances. Summer weather affects us slightly, not from deficiency of ventilation, but from the deadness of the air; then the principle adopted is to hang a fire-pan in the pit, which in the course of two or three hours will just carry round a current, and then the air is perfectly right again, but we are not exposed to any bad air in the pits in the same manner as in coal pits.

12,417. Do you find as a liberal owner of mines any tendency in your agents to stint the men of proper ventilation in order to prove that they are economical managers for you?—On the contrary, I find just the reverse, the very first thing that the whole of my captains attend to is ventilation, and for this very simple reason, that the moment ventilation is deficient that moment the wages rise in proportion to the work done, and that moment my attention is called to it, and therefore if they wished to do it they could not do it without my finding it out.

12,418. Then you have, in fact, no complaints made personally to yourself of inadequate ventilation?—Never.

12,419. (*Chairman.*) When ventilation is necessary, what means do you adopt?—In all cases where

FURNESS ABBEY.

H. W. Schneider, Esq.

30 Sept. 1862.

we are driving levels to a great distance we put in air pipes. The general plan which we adopt here is to have a hood similar to what is used for ventilating the stoke hole of a screw steamer or other steamer, and it is placed opposite to the way in which the wind is blowing, so that the wind blows down the pipes and along the pipes to the end of the level.

12,420. Do you use any other artificial means of ventilation?—We have repeatedly thrown water down the pits so as to drive a current of air into the workings simply a waterfall.

12,421. (*Mr. Austin Bruce.*) As an occasional expedient?—Just as an occasional expedient.

12,422. Have you ever any strikes?—Very seldom.

12,423. When they have arisen, from what causes have they arisen?—From a momentary fancy, I should say, nothing more than that.

12,424. For an increase of wages?—Yes; in fact, we have only had one strike all the time that I can remember, and upon that occasion our mining captain did not even consult us; he was on the mine, and the men turned out and said that they would leave work if their wages were not increased. "Well," he said, "I shall soon settle that for you, I am going into the "office and I shall be out again in a quarter of an "hour, and whoever is not at work will leave the mine, "and I shall never employ him again." In five minutes every man had gone to work again.

12,425. Then it was a mere question of wages and not of management?—Just so.

12,426. Having had as I know that you have had, great experience of workmen in other districts what character would you give of your men for their sobriety and good conduct?—I think that they are a fair average but not above an average, a fair average of the better class of men; I think that they are decidedly superior to what I know they are in Wales.

12,427. (*Mr. Holland.*) More steady?—Steadier.

12,428. (*Mr. Austin Bruce.*) Do you know Staffordshire?—Not well. They are decidedly very superior to Staffordshire.

12,429. (*Mr. Holland.*) Do you know Cornwall at all?—Not very well.

12,430. You said that your deepest shaft was 100 yards?—Yes.

12,431. Is it used by the men for the purposes of ascent and descent?—Only a few men, about 10 or a dozen, who are at work in that pit.

12,432. When you said that the average depth of your shafts was 30 fathoms, that is the average depth which the men have to climb by ladders?—Yes.

12,433. Do you think that that in any way affects their health or strength?—Not 30 fathoms or 50 fathoms, but I should not feel disposed to increase the depth beyond 50 fathoms without taking very seriously into consideration the propriety of raising them by some other means.

12,434. Have they ever to mount 30, 40, or 50 fathoms of an up-cast with the return foul air?—We do not know such a thing, we have no upcasts or downcasts, we do not know the meaning of the words "upcast or downcast."

12,435. If you have no regular upcast or downcast there must be some shaft up which the air which has been vitiated comes to the surface?—It is every shaft in rotation, exactly as the wind happens to be, sometimes the current sets in one direction and sometimes it sets in another.

12,436. Then the men must occasionally mount by the shaft up which the vitiated air travels?—No doubt, that is to say to the extent to which it is vitiated, practically there is no vitiation; I have never been able to discover the slightest difference in the air either in one shaft or in another. When you consider that there is an extent of ground open beneath, which amounts to something like six acres invariably open, and that the total number of men at a time does not exceed 130, and that there is in a great portion of the mine a very strong current of air blowing you will find that there can be no vitiation to a perceptible extent.

12,437. (*Chairman.*) Do they use powder for blasting?—Occasionally, but it is only occasionally when they are driving rock levels.

12,438. (*Mr. Davey.*) You have said that there is some foul air, is not that generally at the bottom of your deepest shaft?—We never get this foul air where there is water, the deepest shaft being the drainage shaft, there is so much water falling about that there is always a current of air kept up in that shaft and although it has at the present moment very long levels attached to it there is no perceptible foul air in it.

12,439. When do you find the air so bad that you are obliged to put down a furnace?—We have not done it this year.

12,440. But you have done it?—We have done it. In the course of a year we shall perhaps find 2, 3, or 4 days when the air is very oppressive from a thunder storm coming on; it then is very dead, there is very little wind; instead of the air pouring through the mine in its usual course it seems to lie dead throughout the whole of the mine and it would soon become oppressive if the men were allowed to go to work under those circumstances; they therefore put in a furnace just sufficient to create a current of air to re-establish the equilibrium of the circulation of the air, that is all.

12,441. Then that foul air has accumulated during the time that the men are not working?—I want to draw a distinction (because it is important) that we have not what is techincally called foul air in these mines at all, it is dead air, it is not foul air, because foul air conveys to everybody's mind the air which you have in coal pits; tho only foul air that we have is when there is the want of a current, arising from the calmness of the air in very hot weather, and at a time when the air is oppressive upon the surface, there is a stagnation arising in the mines, which if not removed, would in course of time render that air unfit for the men to breathe from the exhaustion of the vital principles of the air.

12,442. That does not occur very often?—It does not occur, on the aveargе, more than three times in the course of a year.

12,443. Then it would not be worth while to alter your shafts so as to make one higher than another, in order to make an up-cast?—We had better stop working on those days, and pay the men, than adopt any system of that sort; we have nothing that we can depend upon for twelve months together except our pumping pit; the ore lies so irregularly that that which may be a good shaft this month may be entirely gone in the course of twelve months, and therefore we cannot adopt any permanent system of that sort, and we are repeatedly obliged to vary the operations of the mine because one shaft is shut up, and a new shaft is opened; therefore we cannot adopt any system of that sort, because it would only be fallacious, and would entirely destroy the object which we have in view. The ore in this country lies so irregularly, that you must treat every deposit according to its own rules; there is no general rule applicable. This district is perhaps more investigated by geologists than any district in the country, but the universal result is, that the more a person knows of it, the less he finds he can understand it.

12,444. Are these mines the same as the others in the conglomerate?—These mines lie in the limestone; in one case Lindale Moor the slate rock lies at a part of the mine, but not universally. At Parks mine we have the slate rock adjoining the mine, but nowhere touching it; and all the other mines in the district appear to be entirely in the limestone rock.

12,445. Is it in the limestone that the boulders come down and cause the accidents which you speak of?—No; they are large lumps of solid ore lying in the soft ore. They will appear to be perfectly safe, but some little pressure may accidentally come upon them from above, and disengage them, and cause them to fall out. There is no warning, and there is no means of detecting that they are loose; in fact we do not know the size of them; the peculiarity of the ore is such, that you may not even know that there is a large mass of ore above you or near you.

12,446. Do these stones fall out just after they are exposed, or after a time?—There is no rule.

12,447. What are your average wages?—I have taken out a return purposely to give it you for the last five years, and the average of every man and boy employed upon the mines, adding up the number of hands employed upon the mines, not distinguishing boys from men, amounts to a guinea a week; those are the net earnings; all the deductions are taken away first, candles, tools and powder, which are deducted from the bargains, those do not appear in our pay sheets at all.

12,448. What are the highest wages of those who work underground?—A few men will occasionally earn up to 7*l.* a month. Men repeatedly earn up to 25*s.* a week.

12,449. Is that for any peculiar work?—No, simply that they have worked hard, or that for a time that their pits have been rather favorable for their working. Last month, which is a very fair average, the underground men at the Parks mine earned 4*l.* 10*s.*, the underground men at Whitriggs mine earned 4*l.* 15*s.*, and the Newton and the Mousell underground men earned 4*l.* 10*s.*

12,450. (*Mr. Austin Bruce.*) Were those months of four weeks?—Yes. We have thirteen months for the year.

12,451. (*Mr. Davey.*) Is each man paid separately; —All the surface men are paid separately; the men who work upon the tops of the pits are paid separately but the underground men are put into what is called a set, and are paid so much per ton for the ore which they raise. They depute one of their number to come, I do not know whether it is invariably the same, I never enquired into that, but he is deputed, and his ticket is given to him properly made out, and the money, and they invariably meet together, look at the ticket, and divide the money.

12,452. Is it paid in gold and silver, or any portion of it in notes?—We pay as much gold and silver as we can get; we are obliged to use notes.

12,453. To each of those parties, I presume that the money is divided equally?—I believe so; we have never heard of any distinction.

12,454. What is the number of a party?—They will vary from six or even four, and sometimes as low as two but very seldom that, to as high as 20 or 25. We pay to one man, but the bargain is made with the whole; in a certain respect you may say that one man is responsible, but practically it is not so; simply for convenience sake one man's name is taken.

12,455. Supposing that a man undertook a bargain would you recognise that man and allow him to take men at labour instead of their being partners with him?—Certainly not; I must mention, however, that in one of our mines, which is a peculiar one, dealing with a different class of ore altogether, which is called puddling ore, namely, Whitriggs, the ore lies in a very peculiar manner amongst the rock, and after the mine has been wrought and re-wrought somehow or other the levels get filled with ore again; how it gets there we cannot tell; and we have found it sometimes an advisable thing to let a man take a small piece of ground for two months or three months, and work that piece of ground at so much per ton, and let him do what he likes with it, and allow him to employ men, but it is a thing which we discourage, and which we should only do in a particular case of that sort, and for this reason; if they take a pit they may perhaps work for a fortnight or a month where two men are amply sufficient for the purpose without getting any ore of any moment; they may suddenly get into a piece of ground where there is a good deal of ore; it would be very hard to prevent their taking men on to get it, because two men would not be sufficient; it must be got out quickly, but it only amounts to a few tons in the course of a week, it is not to be considered at all as a system, and it is not a thing that we like.

12,456. (*Mr. Holland.*) What is the nature of the accidents which happen?—About eight years ago a party of men were at their dinner, when a small quantity of water broke into the mine; it got into one of the levels and made a noise in rushing through it. The men immediately went to the bottom of the pit; all of them came to the surface except four, who thought they would go back to see what it was; they went without candles, and got into the level where the water was running; they got confused and were taken off their legs, and were drowned, the depth of water in the level never exceeding a foot; in fact they were in darkness; there was a quantity of sand, they fell with it, and it choked them.

12,457. (*Mr. Kendall.*) Those men went from mere curiosity?—Yes. The next accident was this: a party of men wanted to leave work rather sooner than usual, and they sent up a top hand to assist in working the waggons a little quicker on the top. Under those circumstances rules are disregarded; both sides of the pit were opened together; the man put one of the bogies into the empty part; not being accustomed to it, it went to the bottom, and he followed it. The next accident was through a direct breach of a rule. A man went down to the bottom of the pit to see that it was ready to arrange the bottom of the pit for the skip to come to the bottom, and then the men at the top were preparing their timber, and they had to pass down their timber and their tools, but before the men had got the pit top arranged they passed on to the cage the timber and the picks; one of them fell over and struck him in the centre of the head and killed him on the spot. The next accident occurred about 12 months ago; we were temporarily obliged in a pit to have a ladder way up the side of the pit in the cage shaft. At that time, and now we are working that engine, both for drawing ore and pumping water. At certain periods they disengage the skips, and let them rest at the bottom of the pit, but during intervals of work the cage is in the pit while they are pumping the water, and the rule laid down for the men is that no man is under any circumstances, to go into that pit to climb without ringing to the top of the pit and having the winding engine stopped while he is climbing the pit, and he has no right to go into that shaft until it is signalled back again from the top that all is in order. While the cage was going up these men went into this pit and set to work to climb, the cage instantly went down, and knocked both men down over the ladder.

12,458. (*Mr. Holland.*) Are there accidents often from the falling of the timber?—Very rarely indeed; the men are accustomed to it, and they keep their ground properly timbered. So strongly do we feel upon that point of keeping the ground properly timbered that we never work in our mines more than one set of men a day, and it would be a very urgent case of necessity that would induce us not to put in the timber before they began to work. Each man is sure to throw the blame upon his neighbour for not keeping the ground timbered. We found that the men worked to such an extent as to enable us to get a sufficient quantity of ore per annum without working more than I have stated.

12,459. Would it be expedient to employ separate timberers from the men?—No; because the distances are so great that you would not have them when you wanted them, and if anything went wrong the timberers would be blamed immediately, and they would not have the same interest in the men's safety as the men who do it themselves. The men have to repair, and if it is not done properly it falls upon them to do it without extra pay, whereas with the timberers it would be otherwise. The system is altogether so different from that of coal mines that you can hardly compare the two.

12,460. (*Mr. Kendall*). As I understand the nature of the deposit, you cannot work upon any regular system as regards shafts?—You cannot. We endeavour to do so as much as possible.

12,461. Is your ground very expensive in sinking shafts or not?—It would not be called expensive as compared with Cornwall, but it is expensive in sinking in the rock.

Furness Abbey.

H. W. Schneider, Esq.

30 Sept. 1862.

12,462. What is the average depth?—Thirty fathoms. Our engine pit has cost us a guinea an inch for the last 10 fathoms.

12,463. Is there any material difference between the working of your mines and of the other mines in the neighbourhood?—I do not think that there is.

12,464. (*Mr. Austin Bruce.*) Have you any little people here?—Yes; there is just the usual difference between great people and little people. We find it to our interest to manage the mines well, and if we were little people we could not afford to spend the sum of money over them which we do.

The witness withdrew.

Mr. Richard Hosking examined.

Mr. R. Hosking.

12,465. (*Chairman.*) Of which mines are you the manager?—Parks, Mousell, Whitriggs, and Newton; the mines belonging to Schneider, Hannay, and Company.

12,466. How often do you visit each of these mines?—Newton is a very small affair; perhaps I go there once a week or twice, just as occasion requires. Whitriggs is very small, I am not so often present there. Mousell is rather larger, and I am perhaps there twice a week. At Parks I am every day when I am at home.

12,467. Can you give the number of men employed underground in each of these different mines?—There are 450 men in all the mines underground and at the surface.

12,468. How do the men go underground at Newton?—By the ladders.

12,469. What is the greatest depth of the shaft there?—Thirty fathoms.

12,470. What is the greatest length of the drift?—The greatest length of the drift is on the plan. I should think that it would be about 60 yards.

12,471. In any of these mines have you had to adopt any artificial means for ventilation?—Very seldom indeed. In some chance times in driving the opening level we have had to put in a waterfall, but we have never had to do what may be called blowing the bellows or anything of that sort.

12,472. Have you any machinery for blowing in air?—No.

12,473. What course do you ad pt when it is necessary to improve the ventilation?—When it is necessary we put up pipes and raise them a good height above the pit; the air descends and draws the bad air out; it causes a ventilation. We put wooden pipes and fasten them to the side of the pit, and raise them in the air, and extend them into the level, and that causes a communication.

12,474. Does that take air down or bring air up?—It takes the air up.

12,475. How high above the surface of the ground do you take the pipes up?—Twelve to 15 feet.

12,476. Is that sufficient to make a current of air?—Yes; it is only required occasionally just for a trial pit or anything of that sort; we should not require it for working.

12,477. But for working you have a waterfall have you not?—Yes.

12,478. Have you it now anywhere at work?—Yes, at Parks; that is for a drainage level at the bottom of the mine to communicate it with the other pits, and as soon as we can we put down those other pits to communicate with that bottom level, and then this waterfall would not be used.

12,479. You find the waterfall sufficient?—Quite.

12,480. Do you ever use a fire-pan?—Occasionally we have had to do so in summer, in case of very hot weather, but very seldom; perhaps for two or three hours in a day during the hot days of the summer. This summer we have never had occasion at all to use it except once, only one day.

12,481. Whatcaused you to use it on that day; and how did you ascertain that it was necessary to use it?—There seemed to be a stand of the air; it wanted the current breaking; it waved backwards and forwards in the level, but would not ascend.

12,482. Who found that to be the case?—You found it in going down the pit.

12,483. Did you discover it, or did the men discover it?—The men discovered it.

12,484. How did they discover it?—By the candles not burning.

12,485. Did they come up immediately?—Yes, and adopted this system.

12,486. How long had they to be off work?—Perhaps two or three hours.

12,487. After the fire pan had been put down two or three hours they could go back again?—Yes, by putting the fire-pan down it breaks the light air at the bottom.

12,488. You do not blast much, I believe?—We do not blast any of the ore in any of the mines, only in sinking the rock pits, or driving the rock levels to open a mine.

12,489. Are you particular as to the quality of candle which you give the men?—We use one quality of candle. I never remember seeing any but one quality of candle here; it is the common tallow with a cotton wick.

12,490. (*Mr. Austin Bruce.*) Do you ever have any complaints of the men that they are working in insufficient air?—No; they cannot work in insufficient air, the candle will not burn, that decides it at once.

12,491. A man may work in air that may be unwholesome, although it may not be bad enough to put out the light?—I do not think he can in these mines.

12,492. There are degrees of badness before a candle is put out?—We do not drive it to that extent as to put the candle out before we stop it. First of all, it burns upright; if the air is getting to be what we call impure or short of air (bad air we call it) you have to lower the candle more and more until it gets down on its side before you can get it to burn, and after you begin to lower it from a horizontal position then the grease begins to run on the wick, so that it puts out the candle of itself.

12,493. Is the heat very great below?—Not at all.

12,494. How do the men work, as regards their clothing?—Some work in flannel, and some in a check.

12,495. Do any men work naked?—No; it is not so warm as to require that; I never saw a man work naked in those mines.

12,496. (*Mr. Kendall.*) Have you ever worked in any other mines than these?—Yes; I have worked in Cornish mines.

12,497. (*Mr. Davey.*) You are a Cornish man, are you not?—Yes.

12,498. (*Mr. Kendall.*) Have you known bad air there sometimes?—It is much similar to what it is here.

12,499. Is it just as bad in Cornwall as here, and just as bad here as in Cornwall?—I found the air in Cornwall give way just the same as it does here.

12,500. (*Mr. Holland.*) As frequently here as in Cornwall?—No, I do not know that.

12,501. (*Mr. Kendall.*) In how many Cornish mines have you worked?—I have worked in Carn Brea mines, and I have worked in some mines near Pool, East Crofty; and I have worked in some mines near Marazion.

12,502. Have you worked as a tributer or as a tutworker?—Both.

12,503. Have you worked in the deepest levels as well as in shallower?—I never worked below 100 fathoms.

12,504. Was that in consequence of the fatigue, or in consequence of the air?—I did not like the climbing of the ladders, that was the thing that I most looked at.

12,505. With regard to the ventilation, did you

ever suffer much from bad air there, so far as 100 fathoms goes?—No, I never did. Sometimes in driving a level, before you could communicate, the air was not good.

12,506. You do not see much difference between the air here and in Cornwall?—Not at all.

12,507. What do you call the air here?—I consider that here it is very good air indeed, but we are not plagued here with the powder smoke which they have in Cornwall; our air is purer, we have not the sulphur in the working of the mine the same as they have there; there may be some little impurities there which we are not troubled with here.

12,508. If I understand you generally speaking your air is good, but when it is bad air it is very bad?—Yes.

12,509. There is not much degree about it, it does not get from bad to worse?—You feel first that the candle will give way and the next thing is that you will feel a want of breathing.

12,510. When the air is at all bad it is generally distinguished by being very bad?—Yes.

12,511. Is that rapidly?—It will vary in the distance that you are extending your level; another thing accounts for it, namely, the way in which the wind blows on the surface.

12,512. As I understand you your deposits are so very uncertain that you cannot work as in other mines upon anything like a system?—We can in the Parks mines.

12,513. Why can you do so there?—Because we have there a sufficient flow of ore which will allow us to lay out a sufficient amount of money for it, but in the little patches of ore you cannot do so; you then sink down a shaft into the ore and then you perhaps get another to communicate and you just work those two pits.

12,514. Are your shafts expensive or not?—The rock ones are, we have one that cost us nearly 100*l.* a fathom, I am certain that 10 fathoms of it did so.

12,515. Does not it sometimes happen that in consequence of the expense of shafts there is a greater delay in sinking a shaft than there ought to be?—I do not think that.

12,516. (*Mr. Holland.*) You know that miners' consumption is very common in Cornwall?—Yes.

12,517. Do you see anything of it here?—No, I have never known a case of it here.

12,518. What do you think is the reason of its absence here?—The mines are not so hot and we have not the powder smoke to contend with, there is no doubt that that is the cause.

12,519. Is there less climbing?—Yes.

12,520. Is there as much beating the borer here as in Cornwall?—It is nearly all pick work here.

12,521. Do you attribute much importance to that?—No, I think not.

12,522. Have the men less oppressive work here than in Cornwall?—They have heavier work here than in Cornwall.

12,523. They have more heavy lifting and so on?—Yes, the picking is harder work than the boring and the metal that they are working amongst is heavier.

12,524. Does the picking put them out of breath as much as beating the borer?—It is much the same, but the Cornish work is generally lighter than this work is. Of course you can use the pick or the hammer to any extent, you can work easy or you can work hard with either of them.

12,525. Have you ever known men obliged to charge more for their work because the air is bad here?—No.

12,526. You have often known that in Cornwall, have you not?—Yes.

12,527. When the air has been very bad they have been obliged to charge a considerably higher rate?—Yes, they perhaps are paid twice or three times the price for the ground in Cornwall that should be paid for it if the air was good.

12,528. You have known that in Cornwall?—Yes.

12,529. But you have never known it here?—No; in Cornwall they have hard ground to get communication but that is not so here.

12,530. If the men are exposed to poor air here is it only for short periods?—Yes.

12,531. But in Cornwall it may be for a long period?—Yes, it may be for months in order to establish ventilation. The distance here is nothing, you can put down a pit in a few days and if you want to drive a level the ground is so soft that you can get it in a very few days.

12,532. Are not the wages better here than in Cornwall?—I think they are.

12,533. Do the men live better here than there?—I think they do.

12,534. Are they as sober do you think?—Generally I think they are.

12,535. Are not miners both here and in Cornwall very sober men as a class?—There are always exceptions, but as a class I think they are very well, I have not any cause to complain of it, taking them as a general body of men.

12,536. Are they a stronger class of men here than the Cornish men?—I think they are.

12,537. They are bigger men?—Yes, they are more adapted for this class of work.

12,538. Are they more muscular men?—Yes.

12,539. Have they more flesh about their bones?—They are stronger men generally.

12,540. Are there more old men amongst them?—Yes.

12,541. Are you sure of that?—Yes.

12,542. Are there a good many men of 50, 60, or 70 years of age?—Yes; we do not call a man old here unless he is after 60 years of age; in Cornwall there are hundreds of them old men at 45, their constitutions are breaking up.

12,543. Have not the mines here expanded very rapidly?—In the last 15 years.

12,544. The men are generally young men when they begin?—Yes.

12,545. (*Chairman.*) Can you state the number of men at the different mines which are under your charge?—The underground men at Parks are 131; surface men 111. At Whitriggs underground and surface 74. At Newton 44 undergound and surface. At Mousell 90 underground and surface. The total is 450.

The witness withdrew.

Mr. STEPHEN JACKSON examined.

Mr. S. Jackson.

12,546. (*Chairman.*) You are manager for the Ulverstone Mining Company?—Yes.

12,547. What are the names of the mines over which you have charge?—Lindale, Cote, and Eure pits.

12,548. They are iron mines?—Yes.

12,549. Which is the largest of those two mines—which has the most extensive workings?—They are worked together as one mine.

12,550. What is the number of men altogether employed?—We have only about 60 men and boys altogether.

12,551. How many are underground?—I should think about one half, as nearly as I can recollect.

12,552. What is the greatest depth of shaft?—The greatest depth that we are working is 115 feet.

12,553. What is the greatest quantity of ore which you raise in one year?—About 25,000 tons.

12,554. How long has this mine been at work?—The Lindale Cote mine has been worked for about 25 years, and is worked out. We are not working there now, we are working the Eure pits now. We are only beginning to work as it ought to be worked. We have heretofore not had anything very satisfactory, only

single workings, but now we have sunk an engine shaft; we are about putting up an engine, and we are driving a level through all the mining ground.

12,555. Do you go into all these drifts from the shaft?—We shall go into the drifts from the engine shaft, at least we shall have a connection from the level to all the shafts that we shall sink.

12,556. How many shafts have you sunk?—We have four shafts working at present.

12,557. Are those connected?—They are not connected. The No. 3 and No. 4 shafts are connected, and the No. 1 and No. 2 are connected as air shafts—there is an air draught between.

12,558. Is the air draught below where you are working?—No, it is a little above where we are working.

12,559. Is that air shaft under the limestone rock, or is it through the ore?—It is through the ory ground.

12,560. What is the nature of the surface above where you are working?—Generally pindle.

12,561. Do you support that with timber?—Yes.

12,562. What amount of timber do you suppose is used?—We use a large quantity, according to the quantity of ore that we get.

12,563. What proportion?—We calculate that every ton of ore costs us a foot of wood, so that our consumption of timber would be something over 20,000 feet in the year.

12,564. In these workings have the men ever found fault with the air?—Very rarely.

12,565. But they have sometimes?—Sometimes, in a very extraordinary hot time.

12,566. What means do you then adopt?—We have a fan blast.

12,567. How is that worked?—By a boy from the surface.

12,568. That forces the air down what kind of pipes?—Through wooden pipes.

12,569. What is the size of those pipes?—I think they are about five and a half or six inches square.

12,570. Are they taken that same size the whole way down?—Yes, and forced into the drift.

12,571. How are the wooden pipes made air-tight?—They go one into another, and they are clayed at the joints.

12,572. Are they morticed in the wood, or is the wood merely nailed together?—It is nailed together; it is planed and put together with white lead, but we very seldom have occasion for them.

12,573. When you have had occasion for them, what has caused the necessity to be apparent to you?—The heat of the atmosphere.

12,574. Have the men complained?—Of course the men make a complaint to the underground agent.

12,575. How do they ascertain that the air is light?—When they cannot keep their candles burning.

12,576. They have no other means?—No. If they find that the candles will not burn well, they say that there is not sufficient air to work.

12,577. Do you supply the men with candles?—Yes.

12,578. What do they pay for them?—They pay 7*d.* a pound for them.

12,579. Do you allow them any special quantity?—They have as many as they require.

12,580. Do they use them at their own houses?—I think not; I have never known an instance where they have done so.

12,581. But if they paid for them, would you find fault with it?—We should. We do not wish them to be used for any other purpose than our own.

12,582. But you do not limit the quantity?—No, we pretty generally know hat a wset of men should want in candles during the week.

12,583. But you would give them more if they wanted it?—We should not hesitate to give them a pound or two extra, if the men could assign any reason.

12,584. On working in a party, how much a week is used?—They use about a pound a day, about 7 lb. in a week, that is for one set of men.

12,585. How many men?—Generally about two men.

12,586. Do the men pay anything to a club?—No, we have no sick club.

12,587. Are there any deductions for a doctor?—No, none at all.

12,588. Or for schools?—No. I think that Mr. Brogden subscribes pretty liberally to schools.

12,589. What are the deductions from the men?—We have no deductions from the wages of the men excepting for candles.

12,590. And for sharpening the picks?—No, we find them with picks.

12,591. They bring them back to you?—Yes.

12,592. How often do you pay them?—Every four weeks.

12,593. Are they paid up fully, or is there an arrear?—There is the on-lying week.

12,594. Do the men live near the mine?—Not near the mines generally.

12,595. Do they change their clothes when they go into the mine?—Some of them do, and some of them do not.

12,596. Where do those who change their clothes change them?—We have a changing house.

12,597. Are there any means of drying the clothes?—The clothes are always dried in the engine-house.

12,598. But there is another room for them to dress in?—Yes, but they very seldom use it, unless you you forced them there they would go to the engine-house.

12,599. There is no lodging house on the mine?—None.

12,600. (*Mr. Austin Bruce.*) Do you consider them a healthy race of men?—Yes, they are very healthy.

12,601. As healthy as the agricultural labourers about?—I think so.

12,602. You have 30 men underground?—Yes.

12,603. What is the age of the oldest among them?—I should think that the very oldest, perhaps, may be 50 years of age, something of that sort.

12,604. Do you find that 50 is the age at which they usually leave off work?—No, I think not; they often times get a job at the surface when they get up to an age of that sort.

12,605. Which they like better?—Yes, as a top hand. We find our own top hands from them; those are the men who land the bucket and wheel it to the heap.

12,606. The work underground I suppose is hard?—It is hard for a man getting up to that age, it must be so.

12,607. You do not employ any before 18?—No, and none, I think, so young as that. I think they seldom, if ever, come to the mines till after they get married. I scarcely know one. They generally have been farm servants, and then as soon as they get married, they want some more money, and they go to the mines.

12,608. Do you know of any complaint to which miners are subject, and other people not subject?—No, I never knew any complaint whatever. I think they are as healthy as any other class of men that we have in this country.

12,609. Have you had any strikes at your works?—No.

12,610. The men on the whole are contented, are they?—Yes. I have been manager for 14 years, and I have never had the least disturbance with the men at all.

12,611. Is there any difference in the appearance of a miner and of a man who works on the surface?—I think that the miners really look as well as any other men either on the surface or under the surface.

12,612. He is not paler?—No; I do not think that any class of men looks better.

12,613. You are a representative of a company?—Yes.

12,614. Are there some mines carried on by people with small capital?—Yes.

12,615. Is the ventilation there equally good?—There is only one that I know of, and that is the Dalton Mining Company; and they are only just starting, and they have only two shafts, and they have a roadway between one and the other; so that there they have abundance of ventilation.

12,616. Have you plenty of labour here?—Yes; we have never had any difficulty in finding labourers.

12,617. Do you employ imported labourers, or does the district supply you with a sufficient number?—They are either raised in the district or come from a distance.

12,618. Where do they come from?—There are a great many both from Ireland and from Cornwall.

12.619. Do the men object to strangers coming among them?—No.

12,620. Do the Irishmen never get ill-treated?—No; they work comfortably together from anything that I have known; and if it had not been so, I am sure I should have known.

12,621. Did you ever know the men complain of the ventilation without reason?—No, I do not think they do.

12,622. Have you ever known any complaint not attended to?—No, it is our interest to attend to it. If the men cannot work without air, we must get it for them. The new mine which we are opening out now will be upon a much better principle than the old one was, for the main drain which we are taking up, will afford ventilation from one end of the mine to the other; and all the mines which we sink independently of that will be connected.

12,623. Then if the ventilation of this mine is better, in the former works it must have been worse?—Yes. I am speaking of the same works about which the gentleman was asking me before.

12,624. Were the men none the worse for working in the inferior air?—They cannot work at all in inferior air.

12,625. But they did work in these pits which were not so well ventilated as those which you are now going to work?—So soon as they find that the air is not good, they cannot work, and they come up and they must do so.

12,626. There is a degree of bad air in which a man may work, although he is not forced to relinquish work?—Perhaps there is.

12,627. Was not that the case in the pits which you say were less well ventilated than those which you have in hand?—It must be so till there were such appliances as would make them better.

12,628. Nevertheless do you say that the health of the men was satisfactory?—Entirely so.

12 629. Do you know any part of the country where the health of the men is not good?—Among the iron miners, I do not know of any; I think that the iron miners are as healthy a class of men as any in the country.

12,630. (*Mr. Kendall.*) What I understand you to mean by better ventilation under the present system is, that whereas under the old system at times there was bad air, and the men could not work and did not work; by the present system men will be able to work on?—Yes, clearly so.

12.631. Though they could not work at times in consequence of bad air, yet those times were few and far between?—Yes.

12,632. And that will be now remedied?—Yes.

12,633. The men did not suffer?—No, not in their health.

12,634. What was your occupation before you were an agent?—I was agent for the Lancaster Banking Company, and I was an ironmonger and grocer and general merchant.

12,635. You were not a miner?—I was not.

12,636. As far as the mining goes here, you take the men from husbandmen?—Almost invariably they are husbandmen who get married.

12,637. Then as I understand it does not require very much skill to be a miner in these mines?—There is probably somebody in the mines that they are acquainted with, and they get introduced, and get to be wheelers, and then fore-breast men, and so on.

12,638. They easily slip into the work?—Yes.

12,639. It is not like the copper mines?—No.

12,640. Do the men ever make money and go into trade?—I do not believe that they do; no one of them has ever saved money that I know of. They get more than 1*l.* a week on the average.

12,641. You do not know an instance of men saving money out of their wages, and building their own houses?—Yes, they save a little money and build houses, and some have money in the savings bank, but they generally confine themselves to that.

12,642. They do not go into business or take farms?—Not that I know of.

12,643. Do they live better than the husbandmen?—They live very well. I could not positively say that they live better.

12,644. (*Mr. Austin Bruce.*) What are the wages of the husbandmen in this district?—I should fancy that a good husbandman would get 20*l.* a year, and his meat in the house.

12,645. (*Mr. Holland.*) They all have meat?—They all have meat pasties.

12,646. (*Chairman.*) What are a country labourer's wages per week?—Our own labourers are generally paid about 2*s.* 6*d.* a day. That is for men that we have occasionally doing about.

12,647. (*Mr. Kendall.*) And you think that your miners get about 25 per cent. more than your labourers?—I think more than that; they get nearer 50 per cent. more, and they only work seven hours. They are eight hours upon the mine, but there is an hour wasted, they have an hour for dinner.

12,648. (*Mr. Holland.*) Do they occupy their spare time productively at all?—Many of them do in the summer time; they garden.

12,649. They do not hire themselves out to other persons?—No, excepting a little bit in the harvest time; they may go and do a little bit at shearing or something of that sort.

12,650. Have they commonly gardens attached to their houses?—Yes, a great many of them have; those who live in Ulverstone. There are patches let out as garden plots.

12,651. Then their real wages are more than you say; there is their profit upon that garden; it saves money?—Yes. An underground man on an average will get a guinea a week, and some more.

12,652. They are constantly employed the whole year round, are they not?—Yes.

12,653. Do agricultural labourers get constant employment the whole year at that rate?—No. What you would call occasional farm labourers are, I know, very subject to be thrown out many months in the winter.

12,654. In that case the miners' wages are very much higher that the agricultural labourers' wages?—Yes.

12,655. Do they lodge better than the agricultural labourers?—Yes.

12,656. And feed better?—Yes.

12,657. Do they clothe better?—The farm labourers I think clothe as well as the miners do.

12,658. Are they quite as sober and steady in their habits as farm labourers?—Our men are at any rate. I have never had cause to complain of one of them since I was at the mines. They are generally, I believe, entirely well behaved.

12,659. They enjoy a good character for good behaviour?—Yes, and for honesty.

12,659*a*. I believe that the statistics of the district show it to be remarkably free from crime?—Yes; we have little petty thefts now and then, but not much.

The witness withdrew.

EDWARD WADHAM, Esq., examined.

FURNESS ABBEY.

E. Wadham, Esq.

30 Sept. 1862.

12,660. (*Chairman.*) I believe you are agent to the Duke of Buccleuch?—Yes.

12,661. Has he any land in this locality?—He has some small quantity of land, but his property is principally mineral property.

12,662. How long have you been agent to the Duke of Buccleuch?—Twelve years. The owner of the minerals is not the owner of the soil.

12,663. Had you much acquaintance with the working of mines before you came here?—Before coming here I was engaged in Scotland in the working of mines.

12,664. What is your experience with regard to the working of mines? Is it in the actual working or in the management of mines more especially?—Both in the actual working and in the management.

12,665. Do you know how the mines are worked underground?—Yes.

12,666. Do you go underground?—Yes.

12,667. Is that part of your duty?—It is part of my duty to inspect the underground workings.

12,668. Can you give the names of the mines of which you have charge?—There are the Lindale Moor mines, Whitriggs, Cross Gates, Lindale Cote, Newton and Eure pits. I think those are all.

12,669. Has the Duke of Devonshire much mineral property in the neighbourhood?—The Duke of Devonshire has only one mine in the country, namely, Parks.

12,670. From your acquaintance with the men, do you consider them healthy?—Decidedly so.

12,671. Are they well conducted as a class?—I think they are as well conducted and in fact better conducted than so large a body of workmen generally are in masses together.

12,672. Is there any peculiar disorder attaching to the miners?—I am not aware of any. If there is anything they are rather subject to rheumatism.

12,673. Are the mines wet here at all?—In some instances they are.

12,674. Which are the wettest mines of those of which you have charge?—I think Whitriggs is the wettest.

12,675. Is the water pumped out?—Yes.

12,676. Which are the deepest mines worked?—The deepest mine worked here at present is, I think, at Lindale Moor; but we are continually sinking deeper and deeper. We do not partake of the nature of a coal stratum.

12,677. Are not what they call air levels from one shaft to another generally driven preparatory to working a greater depth?—We drive the air levels in the course of our regular workings, and we leave the old drifts above with troughs in them to form air levels after they are done with. When we have done with a drift (which closes in, in the natural order of things), it is filled full of troughs to convey the air; it gets squeezed down to that small size, so that afterwards it is preserved as an air course; by that means the troughs carry the air.

12,678. What are the troughs made of?—Wood.

12,679. Is that sufficient?—We have always found it so.

12,680. Must they not crush in at times?—By that time we have other air courses open. The whole system of our working is a system of air courses. We only depend upon the troughs just for a temporary arrangement; they eventually become closed up. We are obliged in our mining here to make fresh arrangements continually. You cannot sit in an office and say, "We will bring our air round here," and so on, because our top is continually coming down. We have no roof. We are always making provision below while we have that above as a safeguard.

12,681. What artificial means are used in these mines for ventilation?—It is seldom that it is required. When it is required two methods are adopted, either hanging a fire-pan in a shaft, and thereby drawing the air, or putting down pipes, and attaching a fan blast and forcing the air down.

12,682. Do you ever use a water blast?—We have no water blast in the mines under my charge.

12,683. Have you ever been in any of these drifts when the air has been bad?—Yes, upon one occasion.

12,684. Did you feel the effect yourself, or did you see it?—I felt it myself.

12,685. What was the sort of feeling?—A kind of feeling of want of air altogether, which would cause fainting.

12,686. Not excessive heat?—No, just a dullness, a want of ventilation.

12,687. Did the candle go out?—No.

12,688. (*Mr. Holland.*) Did it feel cold?—No, I felt a gradual sinking.

12,689. (*Chairman.*) So that that may happen although the candle does not go out?—It may happen although the candle will burn, but burn dull.

12,690. In the mines with which you are connected is there any uniform system of payment as to the days on which the men are paid?—They are paid once a month in some of the mines, and once a fortnight in the others.

12,691. What is the length of time for which the money is retained in hand?—Universally a week.

12,692. On what days of the week are they paid generally?—On the Saturdays.

12,693. Some mines are paid on the Fridays?—Yes; Mr. Schneider's mines are paid on the Fridays, but the others are all paid on the Saturdays.

12,694. Do you observe any difference in the conduct of the men of those mines which are paid on Fridays, and those which are paid on Saturdays?—No; I think no material difference.

12,695. Do the men get advances during the week if they require them?—They do. On every Friday or Saturday they can obtain an advance.

12,696. Is it given by an order to get provisions?—In some cases in cash, and in some cases by an order to get provisions; it is at their own option entirely; I do not think that in any one instance in the whole district we have a shop connected with the mine.

12,697. But there are shops where an order from a mine would be attended to?—Yes.

12,698. (*Mr. Austin Bruce.*) I suppose it is your duty as agent to the Duke of Buccleuch, to see that the mines are worked in a manner advantageous to your employer?—Yes.

12,699. Has it ever occurred to you that the men have complained to you of the ventilation of the mine?—Never.

12,700. In the instance which you mentioned of your having found yourself in bad air, the men, I suppose, had ceased working?—Yes.

12,701. They could not have worked there?—They would not have worked; the men are never forced to go down a place here; as soon as ever the air becomes dull they are allowed to come up immediately, which they always do.

12,702. Is it always on those occasions, when, from external causes, the draught ceases, that the men suffer from deficient ventilation?—That is the only time.

12,703. Have you never known them suffer when they were driving a-head before they connected one shaft with another?—I have never known them suffer; I have known them not being able to work so many hours, but I have never known an instance of a man being injured by it at all. We have stopped drifts from that cause because we could not carry them any farther.

12,704. What is your opinion of the relative healthiness of the mining and the agricultural population?—I should almost think that the miners had the advantage.

12,705. The population of this district is on the whole a very robust population?—Very much so indeed.

12,706. What mines were you working in Scotland?

—I was at the Forth Iron Works. That was coal and ironstone together.

12,707. Should you say that the workmen here were better or worse, or that there was any difference between them and the workmen at Forth ?—I think that our men here are better off.

12,708. In what respects ?—They are both better clothed and better fed.

12,709. They have better wages I suppose ?—On an average they have better wages.

12,710. (*Mr. Holland.*) Are they better lodged ?—Yes.

12,711. (*Mr. Austin Bruce.*) Have you ever known any strikes ?—No.

12,712. Have you known anything like general discontent among the workmen ?—No.

12,713. Do you believe that inspection on the part of the Government would do any good ?—I do not think it would ; the Government would require to send a man who had very peculiar experience to make any inspection of any value ; it is entirely an isolated description of mining.

12,714. Assuming a man to be perfectly qualified, of what use do you suppose he could be ?—Merely that the Government would feel satisfaction by gaining reports that things were carried on properly. I see no reason whatever for appointing an inspector, but it might be a satisfaction to both parties.

12,715. (*Mr. Kendall.*) Do you think that the appointment of a Government inspector would create a jealousy ?—I do not think so. I do not think that a man among them would object to it.

12,716. Not those parties who work the mines ?—No; provided that a man were appointed who understood this description of mining. I consider that they would feel very great jealousy if a man were put on who had never seen a hematite mine before.

12,717. I would ask you a general question, take the simple question. Do you or do you not think that the appointment of inspectors of mines in this neighbourhood would create a jealousy among the parties ?—It possibly might.

12,718. Would it do good or harm as far as it went as to the development of the mines ?—I must give you a qualified answer to that question. It could not do any harm provided the man understood his business, and it might do good ; but it might very possibly do a serious injury if a man were sent down here who had never been in a hematite mine before.

12,719. Are the mines worked here by parties taking them as a speculation ?—No.

12,720. Does the Duke of Buccleuch work his own mines ?—The Duke of Buccleuch lets them out to tenants.

12,721. Do you think that you would have the same facilities of getting tenants if there were inspectors as if there were none ?—Quite so, I think.

12,722. You merely go down the mines to see that they are fairly worked ?—Yes.

12,723. You have nothing to do with the setting of the work ?—No, excepting that if they were worked in such a way as that by those workings they would hinder future workings, I should at once direct the works to be set out in a different way.

12,724. You do not set a bargain to any man ?—Nothing of the sort. I am merely an inspector of mines for the Duke of Buccleuch.

12,725. Therefore you are not required to go underground very frequently ?—No.

12,726. How often do you go underground on an average ?—I perhaps average once a month at each mine.

12,727. With regard to the foul air from which you once suffered, is that the only time that you ever suffered from it in your life ?—Yes.

12,728. Can you account for that at all ?—The atmosphere at the time was heavy, and there was a want of circulation in the pit.

12,729. Were the men working there at the time ?—The men had been working, but they had gone out because the air was tight, and I went in to see what sort of a place it was.

12,730. The men had quitted on account of the foul air ?—Yes.

12,731. And you wanted to know what foul air was, and you found out ?—Yes, I satisfied myself.

12,732. (*Mr. Davey.*) You say that all your mines are paid on a Saturday ?—Yes, with the exception of Mr Schneider's.

12,733. Are the men paid at the mine in their working clothes ?—Yes.

12,734. Do they come regularly again to work on the Monday morning ?—We miss a few; but as a rule they come very regularly. I think that the behaviour of the men has been very much improved in the last four or five years; we have not so much drunkenness. There has been great provision made by schools and clergymen, and also the tenants themselves have set on fines for men who do not appear on the Monday morning, and that has a great effect in checking the drunkenness.

The witness withdrew.

Mr. ALAN BACKHOUSE SALMON, Junior, examined.

12,735. (*Chairman.*) Of what mine have you charge ?—I am managing clerk for Roanhead Mine.

12,736. That belongs to Kennedy Brothers ?—Yes.

12,737. That adjoins the Park mine ?—Yes.

12,738. Is it worked in exactly the same way as the Park mine ?—Upon the same principle.

12,739. In ventilation, when that is required, what means do you adopt ?—The underground captain I expected would have been called probably for that purpose ; he is here.

12,740. With regard to candles, is that a deduction ?—It is a deduction.

12,741. How much ?—The men are charged 8*d.*, but then it is made up in the price which is given for fathom or tonnage work.

12,742. Do they pay for tools ?—No, every working tool is found.

12,743. They do not pay for wear and tear of tools ?—No.

12,744. What do they pay for powder ?—That is found.

12,745. When are the men paid ?—Every four weeks.

12,746. Is a week retained ?—The-on-ligging-week is kept back.

12,747. On what day in the week are they paid ?—On the Saturday, at about two o'clock in the afternoon.

12,748. Are they paid at the mine ?—Yes.

12,749. Do the men come back to work regularly on Monday ?—Very regularly indeed. I am happy to say that they are perhaps as sober as any, or the most sober I think of any working in the district.

12,750. Do they pay anything towards schools ?—Nothing is paid towards schools.

12,751. Do they pay towards a club ?—We have a sick club.

12,752. What do they pay to the sick club ?—1*s.* 6*d.* a month ; 4½*d.* a week.

12,753. Does that include sickness and accidents ?—Sickness, and in case of death a payment at death.

12,754. In case of sickness is there an allowance ?—Yes, a weekly allowance.

12,755. Is there any doctor ?—We have no doctor for the mine. The chief of our miners are connected with clubs in the town of Dalton ; if they by chance are on the sick list they are really getting nearly as much from our sick club and the club that they are in as if they were working.

12,756. Although they are on a club you pay the same ?—Yes. We allow 8*s.* a week to them in sickness, and 3*l.* in case of death, and invariably the pro-

FURNESS ABBEY.

Mr. A. B. Salmon.

30 Sept. 1862.

prietors inter any one who dies by accident, which I am happy to say is of very rare occurrence.

12,757. Have you had any accidents?—Very few indeed.

12,758. Any within the last three years?—Two fatal accidents I think in that time.

12,759. By what were they occasioned?—By the falling of earth from what we call the fore-breast; the man had struck rather too far in.

12,760. Was that fall from the roof?—Yes, a sort of sloping fall."

12,761. What is the allowance of candles to each man?—About 2lbs. per week per man.

12,762. Are they limited?—No; if they work by what we call day work, we find the candles; the candles are merely paid for when they work tonnage and fathom work; we make no charge when they are working by day work, only when they are working by contract.

12,763. (*Mr. Austin Bruce.*) Have you ever had any complaints from the workmen that they were working in insufficient air?—No, we have not had any complaints at all on the mine.

12,764. Is your mining population a healthy one?—Very indeed.

12,765. (*Mr. Kendall.*) Your mines are nearly all worked on the same system about here?—Yes.

12,766. And when you know the history of one mine you know the whole of the mines?—I think that when you get the history of Harrison, Ainslie, and Company's mines, and of Schneider Hannay and Company's mines, you get the history of the whole of them. They are all worked upon the same principle, and they are all very unanimous in their work.

12,767. How long have you been with Kennedy Brothers?—Nearly six years.

12,768. What was your occupation before that?—I was a bookseller and stationer

The witness withdrew.

JOSEPH RAWLINSON, Esq., examined.

Rawlinson, Esq.

12,769. (*Chairman.*) You are owner of the Carr Kettle, Liddle Moor, Old and New Cross Gates and Eure Pits mines?—Yes.

12,770. How are they worked?—By shafts and drifts.

12,771. What is the deepest shaft?—The deepest shaft that we are working at present is about 65 yards; I believe the shaft is sunk to 80 yards, but we have never been at the bottom of the pit yet; it is sunk ready for extending the drifts.

12,772. What is the extent of any of the drifts that you are now working from the shaft?—From the shaft to the extent of some of the drifts may be perhaps 150 yards, or something like that.

12,773. Does the overlying ground collapse, and do you support it with timber, the same as in the other mines in the district?—Yes; it is much the same; we have a loose earth on the surface, what they call a pindle.

12,774. What means do you adopt when the air gets foul?—We generally have air passing from one pit to another, so that we get a regular communication, and in some cases, where we have an air way closed up (sometimes we go through clay) we put in a wooden trough about 12 inches square, which forms an air-way, that is a temporary act, comparatively speaking, in case that some of the drifts should get closed.

12,775. Have you never in your workings found that the men's candles would not burn?—In some instances, but it is very rare.

12,776. When that is the case, what do you do?—We should blow air in, or get a communication to another shaft as quickly as we possibly could.

12,777. Till you get a communication to another shaft, what means do you adopt?—We sometimes blow in air, either with a bellows or with a fan blast in some cases.

12,778. How is that fan blast worked?—By the engine or by hand.

12,779. Have you one fixed to the engine that we could see?—Not at present, we have no occasion for anything at present, but we have had such occasion.

12,780. Have you one on the mine that we could see?—We have a large cylinder bellows which you could see that we have used for blowing the air into one pit where we have not a sufficient room of royalty to have an air pit conveniently, and we adopted that plan, but it is not working, and has not been for three years.

12,781. Of what kind is that?—It is a large round bellows, a sort of cylinder-bellows, and it blew quite sufficient air in.

12,782. (*Mr. Holland.*) Working in water?—No; a common bellows, the same as the blacksmith's occasionally use, but on a larger scale.

12,783. (*Chairman.*) Was the air blown down wooden pipes?—Gutta percha pipes.

12,784. Of what diameter?—Three inches.

12,785. You found that to answer?—It answered very well indeed.

12,786. To how many men did it supply air at the end of the drift?—About ten men in the pit.

12,787. You do not use much powder, I suppose?—Very little powder indeed, but in that pit we had a few shots every day.

12,788. Was what you have mentioned the means of dispersing the smoke?—Yes; it deadened the smoke, and the men could work very comfortably.

12,789. Have you ever observed how soon the smoke got away so as to let the men in?—It drove it away from the fore-breast so that the men could work and after that it got so much deadened that the men did not feel the effects of it much; the men were away a very short time.

12,790. Do you remember about the length of the gutta percha tube which you had?—It would go down the pit about 55 yards deep perhaps, and I think there were some 70 or 80 yards from the pit bottom; that would make about 130 yards. It was an expensive pipe; I should say that it cost 40*l.* or 50*l.* altogether, but it was very effectual for a temporary thing of that sort, where you could not get an air shaft down well.

12,791. What deductions are made from the men for candles?—We charge our men with the candles. They take the ore, or the working of the mine, so much per fathom, or so much per ton, and we just charge them the cost price of the candles.

12,792. Do you limit the quantity which they are to get?—Not at all, they are as careful as possible, because they have to pay for the candles.

12,793. They are not likely to dispose of them?—No, I am sure that they will not do so.

12,794. Did you ever see a fire-pan used in a shaft for ventilation?—I have seen it but it is very rare that we have occasion to do so. We have not a fire-pan about our place.

12,795. Is it effectual?—It is effectual when the air gets dense in the pits. When there is a communication between two pits, and it is dense and will not circulate it is effectual; it circulates the air and makes it clear in the interior.

12,796. And creates an upcast current?—Yes, if ever we want circulation we only throw some water down the pit and that creates a circulation without any more bother.

12,797. (*Mr. Holland.*) It falls freely down the pit?—Yes.

12,798. And carries the air with it?—Yes, and makes an upcast draught at the other pits.

12,799. About how much water is required for it?—We let all the column go down, it is only for a short time.

12,800. (*Mr. Austin Bruce.*) How many men do you employ?—About 100 men.

12,801. What is the age of the oldest men among them?—We have miners working underground who are 65, I daresay.

12,802. Are they able to do a good day's work at that age?—Perhaps they are not, but still they will work amongst the rest; they work at the fore-breast.

12,803. Do they suffer from any complaints from which the agricultural labourers are free?—No; the miners employed here are a very healthy race of men.

12,804. Do you think that they suffer from rheumatism more than other men?—Very little; they never get much wet in the iron ore mines.

12,805. But there is a difference of temperature between the pits and the surface?—Yes, but the iron ore is not at all injurious to the health, I believe.

12,806. Have you ever had any complaints from your men of insufficient ventilation?—No, never.

12,807. The men as a rule are content are they?—Yes, the miners of Furness are a very contented set of men indeed. I think that I have been the manager of mines and owner for from 25 to 30 years, and I have only lost three men in that time; only three men have been killed during that time, and there have been very few accidents as to men being hurt.

12,808. (*Chairman.*) Do the men live near the mine?—Not far off.

12,809. Do they change their clothes when they go down to work?—They change their working dresses but they do so at home; they do not change at the mines. Our men do not; I believe that some do. I believe that some of Mr. Schneider's men do. The dwellings of our men are not far away from the mine, and they go in their working clothes from their own houses.

The witness withdrew.

The Rev. JAMES MORRISON MORGAN examined.

12,810. (*Chairman.*) You are vicar of this parish?—Yes.

12,811. Have you been long vicar of this parish?—I have been curate and vicar of this parish since 1846, with about three months intermission.

12,812. Do you consider the population here generally healthy?—Yes, I think so, with the exception that consumption has increased very much of late years.

12,813. Among what class should you say that it has increased principally?—Among persons of sedentary habits—young men and young women—married women die occasionally of this disease. Cases of consumption have occurred amongst the miners, but as a body they enjoy very good health.

12,814. (*Mr. Holland.*) Since about what date has the increase been?—Since about 1846, more in proportion than the increase of the population.

12,815. (*Chairman.*) But you think that that increase has not been among the miners?—No, I think not.

12,816. The population of the whole parish has increased, has it not?—Very much.

12,817. Is that owing to the increase in the number of mines?—Yes, railway and other works, brick-making, and ship building, &c.

12,818. And yet should you say that the average of deaths by consumption has increased?—Very much in proportion.

12,819. Can you account for that in any way?—I think that it arises from the inclemency of the late seasons and the want of ventilation in the houses.

12,820. Are the lodgers in the houses crowded?—Yes, in Barrow-in-Furness, not in the remaining portion of the parish. They are dangerously crowded I should say in Barrow. They are, however, building houses very rapidly. The house accommodation is not sufficient.

12,821. (*Mr. Austin Bruce.*) Barrow is in the parish of Dalton?—Yes; it has lately been made an ecclesiastical district in the parish of Dalton, viz., the District Chapel of St. George's Barrow.

12,822. (*Chairman.*) How is the population of Barrow chiefly employed?—They are employed at the blast furnaces, railways, railway works, ship-building, brick-making, &c.

12,823. So that the accommodation of houses and lodging you think is not sufficient for the population which has grown up there?—Certainly not.

12,824. Have there been any epidemics in your parish in the last few years?—Small-pox was prevalent some years ago. Fever prevailed to a great extent in Dalton until we drained it.

12,825. Do you think that there is more drunkenness in the parish now than there was formerly?—I do not think that it has increased.

12,826. Notwithstanding that there has been a large increase in the population?—Just so.

12,827. Should you say that the miners as a class are sober and well conducted?—They are a respectable body of men.

12,828. Do they acquire any property here or any houses?—Yes, occasionally; steady men occasionally build houses.

12,829. (*Mr. Austin Bruce.*) Do you ever receive any complaints from the working men of the nature of their work in mines?—No; I believe that they are provided with every material that is necessary for the carrying on of mines.

12,830. You have observed, I think I understood you to say, no special complaint or disease as connected with the operation of mines?—Certainly not.

12,831. Is the mining population on the whole as well conducted as the agricultural population?—Quite as well. I would remark that the law affords great facilities for the license of beer houses. They have increased to a very great extent, and they are doing much mischief. Cock-fighting prevails, to the certain demoralization of some persons among the mining classes.

12,832. I suppose of all classes equally?—Yes; of all classes who practise it.

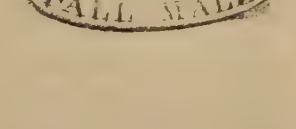
12,833. (*Chairman.*) On what days is the cock-fighting principally?—Generally about Whitsuntide and Easter, the old times, on Saturday afternoons, and at other times.

12,834. Do you think that the means of education now are ample?—Yes; they will be when we have established the schools which we have in contemplation; the schools are nearly ready.

12,835. And will the people be inclined to take advantage of it?—Yes.

The witness withdrew.

Adjourned to to-morrow at Whitehaven.



WHITEHAVEN.

Wednesday October 1st, 1862.

PRESENT :

The Right Hon. Lord KINNAIRD, K.T.
NICHOLAS KENDALL, Esq., M.P.
H. AUSTIN BRUCE, Esq., M.P.
RICHARD DAVEY, Esq., M.P.
P. H. HOLLAND, Esq.

The Right Hon. Lord KINNAIRD, K.T., in the Chair.

Mr. JOHN LINDOW examined.

WHITEHAVEN.
Mr. J. Lindow.
1 Oct. 1862.

12,836. (*Chairman.*) Will you be kind enough to mention the name of the mine with which you are connected ?—We are working at the present time the Wood End mine and also the Gutterby mine.

12,837. What description of ore do you obtain from these mines ?—These mines produce hematite ore ; red hematite ore ; we have two mines as I have already stated, and there are many different pits, the Wood End pits and the Gutterby pits.

12,838. What is the total number of men employed on the two mines ?—Our manager will be able to tell you more minutely than I can, but, as near as I can possibly say, there are about 380 or 400 men employed on the two mines.

12,839. About how many of those men work underground ?—The principal part of those men work underground ; we have no open workings, that is, not from the surface.

12,840. Are the mines connected the one with the other ?—No ; they are not.

12,841. What is the depth of the lowest level at which you are working ?—The depth of the lowest level is about 70 fathoms, that is, the fullest extreme of the depth.

12,842. Does the shaft go down below that ?—No; we have an incline a little below the shaft, but the shaft does not go down to the extreme level.

12,843. What number of shafts are there ?—There are two shafts which are connected with that pit, we sunk one upon a rise of ground to ventilate the lower level.

12,844. The one that was sunk from the high ground is merely for ventilation ?—No ; we raise a little ore at it.

12,845. In the other shaft is there a pumping engine ?—We lift the water in cisterns in a patent box which lifts the ore and the water both at one time ; it has a valve in it ; it fills itself when it goes down, and immediately on arriving at the surface, there is a machine, which it runs into it, strikes a valve, and lets the water run out.

12,846. Is that worked by a steam engine ?—Yes, there is a large steam engine of 40-horse power.

12,847. As I understand, you raise both the ore and the water together ?—Yes.

12,848. But not in the same tank ?—No ; there are two separate tanks.

12,849. Is one placed above the other ?—Yes.

12,850. (*Mr. Holland.*) Is there a sort of platform above the tank in which the ore is put ?—Yes.

12,851. (*Chairman.*) Is the ore brought up in a cage above the water ?—Yes.

12,852. With a bogie running upon the cage ?—Yes.

12,853. Is there a great deal of water in the mines? —No, and that is the reason why we merely use these, on account of the economy.

12,854. Are there different drifts along which the water runs ?—Yes, there are different chambers for working, nearly the same as laying down the town of Whitehaven into streets.

12,855. How do the men go down into the pits, and how do they ascend ?—The men go down by an engine in the cages.

12,856. Do they all go down in the cages ?—Yes.

12,857. Are there no ladder-ways ?—At one time we had ladder-ways, but we found that plan very dangerous ; we had more accidents occur by the ladders going down to a great depth, and a great many of the men dared not go down on account of fear and nervousness.

12,858. Of what description were the accidents that occurred ; did the men fall off from the ladders when they were in use ?—We have had one or two men with broken legs which occurred from the use of the ladders. In case three or four men were going down the ladders and the top man lost his footing, he would take all the remaining party below him down with him.

12,859. (*Mr. Austin Bruce.*) Did such an accident as that ever happen ?—No ; we prevented that by putting up a staging.

12,860. (*Chairman.*) Between each length of ladders there should be, and you had, a staging ?—Yes. We had a staging at the foot of each ladder.

12,861. (*Mr. Holland.*) How long were the ladders ?—They were about 20 feet long ; but it was a small shaft, I should say not more than the length of four ladders, and the men will go down on account of its saving time ; some are more anxious than others are to make money, and such men as those will go down an hour or two earlier, before the engine is set to work.

12,862. What number of hours do the men work ? —We do not limit them ; although many do limit them in this neighbourhood, we do not.

12,863. Do the men work by shifts ?—They work by piece.

12,864. Do they work by night and day shifts, or do they not work by night at all ?—Yes ; a few do work by night, but we do not, if we can avoid it, let them work by night, that is a point of economy.

12,865. Do you let the work by the fathom to the miners ?—No ; we let it by the ton.

12,866. May the men, under such circumstances, go to work at what hour they like, and stay at work as long as they like ?—If the question is confined to our pit alone, they certainly can go at any hour they think proper.

12,867. (*Mr. Austin Bruce.*) In point of fact they may come and go when they please ?—Yes ; the engine is set to work for them at any hour.

12,868. (*Chairman.*) How many men are there in a party ?—That depends upon the width of the working and upon the hardness of the ground ; some portions of the ore are much harder and much more difficult to penetrate with the jumpers than others, and when we find that that is the case, if we were to put a number of men in we should find the profits so much less; the men will have wages, they earn as much as 4*s.* a-day, and many others earn much more ; the best men have the privilege of making as much as they can.

12,869. (*Mr. Holland.*) You aim at that, do you not ?—Yes.

12,870. (*Chairman.*) You let the work to the men, and they may work it in shifts, or just as they think proper ?—Yes.

12,871. Are they permitted to engage men to work for them at night, as well as in the day ?—Yes, it is an advantage to work during the night in some of the workings, but not at the principal ones. We only get five days during a week, and five nights for six days, and when one class of men goes into the workings and leave, the others who follow them on to the shift may not be so competent as miners, and

the advantage that has already been prepared by the first class of men will be likely to be taken away and lost, when the others ought still to be manœuvring to get a certain quantity of ore with one shift, whereas those who follow the others into the workings, that is, the second shift, will be likely to take half of that advantage away by want of skill. On these grounds, and for these reasons we select our men, and have a first class set of men to follow the others if we have a double shift, but we never have a double shift, that is, night and day, if we can avoid it, unless it is a case of emergency, and that is, for getting ore.

12,872. You find from practice that it is important to have experienced men employed ?—Yes, and I dare say all our men are miners that we have ; we have made nearly all the miners in the immediate neighbourhood ; that is, we have reared them, and taught them to become miners.

12,873. You have been employed in mining all your life ?—Yes ; I have.

12,874. And you are connected with one of the oldest pits in the neighbourhood ?—Yes ; the Gutterby and the Big Rigs pits are two of the oldest pits.

12,875. Do you let the work to the miners by the piece ?—It is by the fathom ; if we are driving a stone drift in sand or in lime.

12,876. Are the lowest earnings 4*s.* a-day ?—That depends entirely upon the kind of man, whether he is an energetic, clever man or not ; some men will make 7*s.* a-day, and if so, we are proud to pay that amount to skilful men, but some are making less than that, from 22*s.* to 24*s.* per week ; and referring to those men who work underground as competent miners, you may take the average at 24*s.*, taking the whole of our miners together.

12,877. Are the miners very healthy ?—Yes, very much so.

12,878. Do they suffer from no particular disease ?—None ; there is nothing but pure air.

12,879. Do you never, when driving a drift through stone, meet with poor or thin air ?—Not if you ventilate the place properly, if you do there is no impure air whatever.

12,880. Is there any air in your mines in which the candles will not burn ?—Yes, frequently; if they do not ventilate that drift they will find that the candle will gradually die out of itself, unless they resort to some means to prevent it; if they are driving a drift, but we have none at present. It is 12 months since we had one at which we put a pit down merely to ventilate it at the end of the drift, and to ventilate the adjoining pit.

12,881. Until that connection was effected was the air such that a candle went out in it ?—Yes ; that is to say, it did not go out, but it did not burn well.

12,882. Did you resort to any artificial means for improving the condition of the air in that case ?—We conveyed tubes in a box, pipes to convey the air in to the fore end of the mines.

12,883. Were any means employed for the purpose of forcing air in ?—We have frequently employed such means upon former occasions, but latterly we have not ; we have sometimes applied a fan.

12,884. In what way was the fan worked ?—It was worked by hand by two men.

12,885. Was it so worked on the surface ?—No ; it was near the foot of the shaft, they could not have driven it from the surface ; the air at the foot of the shaft on the low level is equally pure.

12,886. Should you call the air in the low level poor air ?—Yes, but it is not inflammable.

12,887. On the occasion to which you have referred, before you succeeded in making a communication, how were you able to resort to these means ?—We had a connection formed ; we did not work long before we got a connection with the adjoining shaft.

12,888. Did you work as long as a month ?—Yes, and more than that. During the time that we are driving to this place the men can work in the fore end with the candles standing to one side. In our case the candles were not required to incline ; but that does frequently occur.

12,889. How long do you imagine the men had to work as you have described before the circulation was completed, for three or for six months ?—In the drift which I have mentioned I do not think in driving to the shaft which we were putting down, that the men would have been at work there more than two months. We were working our adjoining drift that I am now speaking of ; and it was to take so much of the drift out towards going to the upper shaft which we were sinking for ventilation, for air.

12,890. While you were there driving, am I to understand you to say that the candles never went out ?—Not altogether ; still the place was not what you call so pure as the other part of the mines.

12,891. Did you find the wooden box or pipes to which you have referred answer the purpose for which it was used ?—Yes, until we got the drift through.

12,892. Was there much blasting carried on there? —Yes.

12,893. Did much time elapse before the powder smoke was cleared away ?—No ; it is advantageous, of course, to get it away quickly.

12,894. How long was it before it was cleared away ?—That is a matter which depends entirely upon the management of the person driving the air into the working, I mean the person at the fan.

12,895. If he did not attend to it, what would be the consequence ?—That the air would be so much longer in coming out.

12,896. Have you ever employed any artificial means, such as an engine, independently of men driving a fan ?—You cannot get water at a place of this kind. When you speak of an engine, I may say that we frequently apply water to clear a shaft in sinking it. You merely apply water to clear it in a few seconds.

12,897. Do you let the water go down ?—Yes, in order to force the impure smoke up.

12,898. In that case the water has to be pumped up again ?—Yes, but that is really nothing as compared with keeping the men out of the workings.

12,899. Have you ever seen any of these fan machines driven by an engine ?—Yes, but not by us.

12,900. How often are the men paid ?—Once a fortnight.

12,901. Do you keep anything in hand, or is there what is called a week's in-legging kept in hand ?—We do not do that. We pay them up to the last moment ; the men come from the works to the pay place and receive their money at 3 o'clock in the afternoon.

12,902. Is the quantity worked out all weighed after it is drawn up from the pit ?—At times it is not weighed. Some work by measure ; but it generally amounts to the same thing.

12,903. Do you reckon by the cwt., or is a cwt. practically with you so many more pounds ?—We have 21 cwt. to the ton.

12,904. (*Mr. Holland.*) Is a cwt. 112 lbs.?—Yes, when I speak of 21 cwt., that is to the lessor.

12,905. (*Mr. Austin Bruce.*) But how is it as to the workmen ?—I do not know. Our workmen generally work by buckets.

12,906. (*Chairman.*) Are the men paid by the ton? —Yes, five bogies go to a ton.

12,907. Do you not weigh the bogies ?—No, not with us, to check the men ; but I dare say many do. We do not approve of the principle.

12,908. (*Mr. Holland.*) You see that the kibble is fairly filled ?—Yes.

12,909. (*Chairman.*) To what deductions are the men subject; for powder and candles ?—Yes, those are all with us.

12,910. What do the men pay per pound for candles? —I am not aware of that.

12,911. Is a certain allowance of candles made to them ?—They have the candles, but they may get them where they like ; they are not compelled to get

WHITEHAVEN.
Mr. J. Lindow.
1 Oct. 1862.

them of us. We provide the candles to accommodate them, as they have not cash always by them with which to purchase them.

12,912. So that no deduction is made for candles if a man brings his own?—No.

12,913. Is your practice the same with regard to powder?—Yes.

12,914. I think you stated that 24*s.* per week was the amount of the net wages?—The net wages run from 22*s.* to 24*s.* per week, taking the average.

12,915. Is there any doctor's club or sick club in your mines?—There is a doctor's club if the men choose to be in it; and if so, they pay twopence per week; but it is not compulsory. Many of them have doctors of their own, and, of course, in that case they are not in the club.

12,916. How is this club managed; is it by the owners of the mine?—It is managed by my nephew; he acts as their cashier.

12,917. Is a separate account kept of the club?—Yes.

12,918. What allowance is made to a miner when he is a sick?—He receives 10*s.* a week.

12,919. For what is it that they pay the 2*d.* a week?—They pay 6*d.* for the doctor and their sick money; but independently of that, their net wages which I spoke of are 24*s.* a week. Nothing is coming out of that; they pay 6*d.* for the doctor and their club; but there is no compulsion. Many of them are members of Odd Fellows' clubs, and there are many in Rechabite clubs, and those enter into our club also.

12,920. I suppose the miners who are members of others clubs are permitted to join your club as well if they please?—Yes, if they are inclined to do so.

12,921. Is the fund obtained from the contributions of the men sufficient to pay 10*s.* a week to a man off work?—I do not think it is sufficient; but we have, nevertheless, always given 10*s.* a week. In case their club money ever ran out, I generally made up the deficiency myself.

12,922. (*Mr. Holland*). I suppose there has not been any very large deficiency?—No, if the club is well managed there is not.

12,923. (*Chairman*). To what description of accident are the miners, in your opinion, liable?—A broken limb.

12,924. In what way would that be caused?—It happens very frequently when they have been shooting; many of them are high spirited men, possibly without as much judgment as others, and they will go into a working after firing a shot, and instead of taking their hammers to sound the working, they will go in immediately under it, and very possibly not take a crow bar to bring the loose metal down, and some part of it very often falls down.

12,925. After the blasting has taken place the metal becomes loosened, and it falls down upon them, because they have not taken proper precautions to ascertain whether it has become loosened or not?—Yes.

12,926. Do many accidents occur from blasting?—We have had very few; none have been killed by blasting.

12,927. Are there any blind men?—One of our men, I think, is blind.

12,928. Are you able to trace that to any cause?—It was entirely caused by foolishness.

12,929. Can you describe to the Commissioners in what way an accident happens?—Very often after the miners fire a hole the shot does not run, and it happens in taking the stemming out of the hole again; very often they fire a hole in that way upon themselves; they attempt to clear the old hole out rather than put a fresh hole in.

12,930. Do the miners use an iron pricker?—Yes, we have iron prickers; we have had copper ones, but if you give them to the miners they lay them on one side, and they will take up an iron one.

12,931. Do you not think it would be safer to use copper prickers?—Yes, in hard ground; but in wet and softer ground we fire with a fuze.

12,932. You do not use a fuze in all cases?—No.

12,933. By what means do the men fire the shots?—In ordinary holes with straws.

12,934. Do they put a straw into the hole?—Yes, after they have drawn the pricker out.

12,935. Do they use touch-paper?—They use merely touch-paper which they make themselves.

12,936. Do they judge of the time before the explosion will take place by the length of the touch-paper?—Yes, they judge what distance it is, and they have generally but a short distance to go, say, 10 or 15 yards, until they get behind a pillar to protect themselves.

12,937. Can you state the reason why the patent fuze is not always used?—No, but it is only used in wet ground. In hard ground, in stemming a hole they frequently get their fuze cut into two, which of course prevents the fuze then running down to the bottom of the hole, and in case they were to bore that out it would be more dangerous for them.

12,938. You are of opinion that the men prefer the old plan to the patent fuze?—You could not get them to use the fuze in hard ground, where the ground is dry you cannot get them to do it, they would lose so much time.

12,939. In what way would there be a loss of time?—By the cutting of the fuze; and then they would have to open the hole out again, and that would make it more dangerous, they might easily ignite the powder then.

12,940. (*Mr. Holland*). Do the miners use hard material for stemming?—They use shale, and when that is thumped down by a hammer, it becomes a very solid substance.

12,941. Have the miners any other objection to the patent fuze than that which you have mentioned?—That is the only one; in wet ground it is a great saving.

12,942. Have they any objection to the fuze on account of the smoke?—Not with us; in a badly ventilated place, of course it does cause a little more smoke; but in the places that I allude to they could not work otherwise than with a fuze. I am now speaking of wet ground.

12,943. Do the men generally speaking reside near the mines?—We have some cottages which are as near to the works as we could have them.

12,944. Do the miners change their clothes after they have been underground?—They do not change them until they come home; but their clothes are perfectly dry, except they have been at work merely sinking a shaft, which is more subject to water, and then the men change their clothes in the engine-house as soon as they come out of the mines.

12,945. What proportion of your men do you suppose reside in the neighbourbood of the mines?—The greatest distance is about a mile and three quarters.

12,946. Do the great majority of the men reside close to the mines?—Yes; we build as many cottages as we can, and the majority of the men are in the immediate neighbourhood.

12,947. (*Chairman.*) What rent are the men charged for the cottages?—The highest price that we charge for a cottage is 2*s.*, but in many cases the charge is 1*s.* 8*d.*

12,948. (*Mr. Holland.*) Is that about the value of the cottages to you?—We consider that that sum is sufficient for a poor man to pay, and we are satisfied with it. We consider that that pays us 6 per cent. for our money invested in household property; but many persons charge 2*s.* 6*d.* and 2*s.* 9*d.*, and sometimes the men are charged 3*s.* and 3*s.* 6*d.*

12,949. What amount of accommodation is contained in a cottage?—There are two rooms upstairs and two downstairs, and a yard and a privy behind.

12,950. What is the cost of the cottages to you?—I believe that the last that we built and those that we are now building will cost us about 65*l.* each.

12,951. Each containing four rooms and every

accommodation ?—Every accommodation that I have already spoken of.

12,952. (*Mr. Kendall.*) Is this mine worked by a company or is it worked by the proprietors ?—It is a private mine ; it is our own. It may be worked by ourselves privately. We have a lease from one individual or two ; we have one lease from Sir John Walsh of one mine.

12,953. (*Chairman.*) Have you any other partners in this mine ?—No ; my brother and myself.

12,954. You are the sole proprietors and work the mine yourself ?—Yes.

12,955. (*Mr. Kendall.*) I presume that your men have been, as it is called, bred up as miners, and that they are picked men ?—Yes.

12,956. You do not employ men who are not good workmen ?—No.

12,957. Do you think that the average wages of the miner in this neighbourhood is 24*s.* per week ? —No.

12,958. What do you think is a fair average to take of the wages in the neighbourhood ?—I cannot say ; they vary much in different pits ; and there is a certain class of men who are not worth 24*s.* a week.

12,959. Do you think that the wages average 20*s.* a week, taking one pit with another ?—I do not think they do.

12,960. Do you think they average as much as 18*s.*? —We give to the very poorest men that we have 18*s.* a week.

12,961. Which in your opinion is the most healthy class, the agricultural labourers or the miners ?—I think that the miners are equally as healthy, if not more so.

12,962. Which of the two classes do you think lives the best ?—I can only tell you how our farm servants live and how the miners live ; they live as they think proper.

12,963. Do they live well ?—With 24*s.* a week they need not live very badly.

12,964. I suppose they do not save much out of their wages ?—Not any of them, except a few picked men.

12,965. As a body do the miners drink much ?—I believe they do. I believe they live up to the whole of their earnings generally speaking ; but in certain districts, I am proud to say, that we have many teetotallers, and not one drunkard. We have no fewer than 200 men possessing freeholds which they have obtained from their savings. But I am speaking now of our own mine ; I have nothing to do with the adjoining mines.

12,966. Referring to the men who have worked for the last 20 years in your own mines, you think that as a body they have been more saving than the miners generally are ?—Yes.

12,967. And among those you can reckon many freeholders ?—Yes, there is a great number.

12,968. They have purchased their freeholds out of the savings they have made in your mines ?—Yes.

12,969. As I understand, your miners not only may work as long as they like, but for as short a time as they please ?—Certainly.

12,970. And they not only may work themselves in that way, but they may take a man down into the mine to work under them ? — Yes, to work as a labourer.

12,971. And he may receive from the miner so employing him much less wages than the miner gets himself ?—Yes, of couse that is so.

12,972. May they take another miner down underground with them ? — Not without consulting our manager.

12,973. Do you ever give permission to a man, who has taken a certain quantity of work under you, to return a certain quantity of ore to you, to hire other miners, he arranging with them as to what they shall receive ?—Certainly not.

12,974. If a miner takes down another miner to work with him must that miner share equally with him ?—Certainly so, our manager will look to that, and he will approve of the man before he is allowed to go underground, and he is then put in to share and share alike with the other.

12,975. You are anxious that the labourer shall receive his hire, and you pay him up as close as you can ?—Yes.

12,976. How do you manage to pay him up on the Saturday, do you pay up close, or measure up close ? —A man has finished his work by two or three o'clock.

12,977. Do you measure his work close up to his heels ?—Yes, for the last bogie that comes out is weighed, and he is paid for it in a few minutes.

12,978. In what shape do you pay the men, in notes or in gold ?—In gold and silver.

12,979. No notes ?—No.

12,980. Do you hand over the money to one man, and does he divide it among his comrades ?—Yes ; when there are four or five men in a working we pay the most respectable man of the party, and he divides it amongst his fellow men.

12,981. You have stated that you sometimes have bad air ; in the instance that you referred to, do you happen to recollect the length of the drift before you communicated at all ?—Between one pit and the other I dare say, where we put down the air shaft, it would be 73 or 74 yards.

12,982. How many yards were you in before you felt any difference in the air ?—A great distance, up to the rise before we felt the least difference in the air ; as long as we could work in the ore before we came into the stone drift we had no difficulty in ventilating ; in case you cut through a pillar you thirl through it, and you bank it up.

12,983. Suppose you were driving through the ore with a view to ventilation, and you were to pass from the ore into the rock, would there be any difference then ?—Yes, certainly.

12,984. (*Mr. Austin Bruce.*) At what age do your men begin to work underground ?—We have no boys ; they are 18 or 19 years of age. When we take a labourer to commence work he has generally been a farm servant before he came to us to work as a miner ; he goes down into the works at the age of 18 or 19 as a labourer, and works for two or three years, and after the expiration of that time he would become a thorough miner.

12,985. Are the majority of these miners able to read and write ?—The whole of our men are.

12,986. Are there any schools connected with your works ?—Yes, we have a school ; it is not a national school, it was built by ourselves in the village of Cleator, it is half a mile off.

12,987. Do you manage the details of the ventilation yourself, or do you entrust the management to an agent under you ?—It is entrusted entirely to our own manager who is my nephew.

12,988. Do the miners ever make complaints to you of what they consider a deficiency of air ?—No, I do not know that we have had any complaints made for a great many years.

12,989. Do you find that your miners are, generally speaking, a contented set of men ?—Yes, they are a very happy set of fellows.

12,990. Has there ever been a strike amongst them ?—There was about 30 years ago.

12,991. Have there been many strikes in this neighbourhood among the miners ?—There have been strikes in nearly all the pits, with the exception of Mr. Hill's and our own. I know that there have been two or three very violent affairs—threatenings.

12,992. Do you know what the cause of those strikes was ; was it some difference between the masters and the men ?—They followed upon some questions arising about management.

12,993. Does the truck system prevail in this neighbourhood ?—No, not in any cases that I am aware of.

12,994. You stated that among your workmen, who, I think, were fewer in number than 400, some 200 of them had been so provident as to acquire

WHITEHAVEN.
Mr. J. Lindow.
1 Oct. 1862.

freeholds?—I dare say that there are 200 of them who have done so.

12,995. Do you think that that is a larger proportion than exists generally in the neighbourhood?—Yes, I do.

12,996. To what do you attribute the superiority of your workmen in this respect?—It is merely on account of our selecting them, and getting men of good standing in their position; we select them from a respectable class of men.

12,997. If you are short of workmen, and men apply to you for employment, in what way do you examine them?—We merely test them by putting each of them into particular workings, and if we find a man who is either dissatisfied or a drunkard, we remove him.

12,998. That may show that a man is not a good or a steady workman, but it hardly shows whether he possesses those moral qualities which will lead to his becoming a saving man; do you apply any other test?—When we find that a workman is not a steady and saving man we immediately discharge him.

12,999. Do the men that you thus discharge find employment elsewhere?—Yes.

13,000. You have stated that you allow your men to come and go when they please, and to work for as few and for as many hours as they like?—Yes.

13,001. Do you find that the men generally make an ill use of that privilege?—No.

13,002. Has it ever happened that your machinery has been kept idle on account of the men not attending regularly?—Not now, nor for many years.

13,003. Probably in your case such indulgence may be safely allowed in consequence of the care you take in selecting your workmen?—No doubt of it.

13,004. I presume you would hardly consider that a prudent course to pursue in general?—I do not know that. I think that if you open your pit at a certain hour, and you do not allow the men to return up or go down the shaft for a given number of hours, you will find that you will not have so good a class of men applying for work as if you allowed them a little more liberty.

13,005. Do you consider that there would be any hardship in requiring that every workman who works in your pits should continue for a certain number of hours, say 8 or 9 hours a day, at work?—A miner would consider it a great oppression if we compelled him to remain down the shaft for eight hours.

13,006. Is it not almost the universal practice to do so, both in this district and elsewhere?—It is not so here; there may be an isolated case or two of the kind, but it is not general.

13,007. Is your practice the general practice of the district?—Yes; but I know that they are getting up a fresh principle now, in order to compel the men to go down for 8 or 10 hours, and not to permit them to come up again until that time has expired; but we do not approve of it.

13,008. Practically, how many hours a day do the men work?—They will not work more than 8 hours a day; what with having their luncheon during the day, and smoking, and doing different other things.

13,009. I suppose that being steady men they usually do work 8 hours a day?—Yes, and some of them work more than that if they want to make more money.

13,010. Is your ore picked at the pit's mouth?—Ours does not require it.

13,011. (*Mr. Holland.*) Your lifting machinery is going on always is it not, because it draws the water?—We have a tolerably large sumpt, so that we do not require it to go on during the whole night, unless we are lifting the ore during the night; we have a large sumpt below.

13,012. But it is going on, is it not, a great deal more than 8 hours a day?—Yes, we lift ore more than that, for 10 or 12 hours a day.

13,013. But you would be obliged to work it, would you not, more than 8 hours a day if you were not lifting the ore?—I think 8 hours would keep the water out in the whole of the 24 hours.

13,014. Do the men attend regularly?—Yes, in practice they do.

13,015. Have you among your workmen a fair proportion of elderly men?—Yes.

13,016. At what age is a man considered old for a miner?—We have some of them, I dare say, as old as 65.

13,017. Is that age remarkable among them?—There are some miners of the age of 70 in the immediate neighbourhood.

13,018. Then that fact does not attract much notice?—No.

13,019. Have you a good proportion of men, say a third, above the age of 50?—No, I do not think that we have; our men are a younger class of men.

13,020. At what age do they generally give over mining?—They work as long as they live almost, those who have been brought up to it.

13,021. If they are chiefly a young class of men, and work as long as they live, does not that imply that they die rather prematurely?—None of them died prematurely, they generally live to a good old age.

13,022. Are the elderly men employed upon lighter work?—No; we have a man who is upwards of 60 years of age, between 60 and 70, who is now working for us, he is able-bodied still and a hearty man.

13,023. But the great majority you say are young?—Yes.

13,024. A greater proportion than in other employments, or the same proportion?—I see a great many old men in other employments as well.

13,025. How long are the men compelled to breathe air in which it is necessary to slope the candle; several weeks?—That depends entirely upon the length of the drift.

13,026. But, generally speaking, for how long a period would they breathe such air; for several months?—Sometimes weeks, sometimes only for days, sometimes months.

13,027. But which is the most common; days, weeks, or months?—Only a few weeks; we never drive a drift to any extent; we drive it quickly, and we do it by three shifts, that is by three sets of men in the 24 hours, and by 8-hour shifts; we drive it as quickly as possible, and when we have bad air we always keep a fan blast at work to convey the air in.

13,028. But is that sufficient to keep the air so good that a candle will burn in it upright?—Yes, if you give in a sufficient quantity of air from the shaft foot where you have it pure, and drive it directly to the fore end, the candles will burn.

13,029. But is that done?—It is so seldom that we have drifts of that kind that it is very rare indeed.

13,030. It is very rare is it to have men working in drifts where the candle has to be sloped?—Yes.

13,031. In such places do they continue working more than a month?—Yes, in hard ground it requires more than a month. If it is soft ground they will cut a long drift in a month.

13,032. What is the longest time during which the powder smoke hangs about, and prevents the men continuing their work?—In some places, after they have fired a shot, our men can go on in a few seconds.

13,033. But what do you suppose to be the longest time that elapses before the powder smoke is sufficiently cleared away?—I do not know.

13,034. Did you ever know the powder smoke to hang about for half an hour?—Never so long as that, they remain for a few minutes or for a few seconds out of the workings.

13,035. If the powder smoke hung about for half an hour, and so prevented the men from working, would that be considered a very remarkable circumstance?—Yes, and a very injurious one to the mines, both to the men and to the masters.

13,036. Does such a case as that ever happen?—Not with us.

13,037. Do you think that it happens in other mines?—I do not know; there are instances I have no doubt where they are under the necessity of taking a longer time before they can go back again to their work.

The witness withdrew.

Mr. JAMES DEES examined.

13,038. (*Chairman.*) I believe you are a civil engineer by profession?—Yes.

13,039. What is the name of the mine or mines in which you have an interest?—The name of the mines is the Parkside mines; we trade under the name of the Parkside Mining Company, they are situated about five miles from Whitehaven.

13,040. Does the company consist of shareholders?—The company consists of four individuals.

13,041. Do they reside in the neighbourhood?—Yes, all of them reside in the immediate neighbourhood.

13,042. For how long a period have you worked these mines?—Between seven and eight years.

13,043. What description of ore is produced in the mines?—It is hematite iron ore.

13,044. What is the total number of men employed in the mines?—I cannot tell you the exact number of the men employed, but we have upwards of 500 miners, and, I think, including the men who are employed at the surface, we must have nearly 620.

13,045. What is the greatest depth of any of the shafts in the mines?—The greatest depth in our mines at present is 60 fathoms, or 120 yards.

13,046. How many shafts are there?—There are five shafts that we are working.

13,047. What is the greatest distance between any two of the shafts?—160 yards.

13,048. Is your mine a wet or a dry mine?—It is perfectly dry.

13,049. How do the men go down into the mine?—They descend by a cage; we have a cage fitting into slides or wooden uprights, and the cage slides down without any lateral motion whatever.

13,050. Do you employ a safety cage?—Yes; we have safety cages in one or two of our mines, and we are applying them to all the rest.

13,051. Do you consider that they are attended with advantage?—Yes; very great advantages; indeed we have had instances of the great utility of them, for example, from the chain breaking, and the cage seizing hold of the slides, it did not go down more than half an inch with a loaded bogie.

13,052. Do you use a wire rope or a chain?—We use a wire rope in two of our mines, and a hempen rope in the others; it is a flat wire rope.

13,053. Do the men not object to going down in the cages?—No.

13,054. Are there any ladder-ways in the mines?—There is a ladder in one of our mines; but it is in an entirely distinct portion of the shaft from that through which the ore is drawn, and it was rather to enable the men to get up and down when the engine men were not there; we do not use it except they want to go down on a Sunday, or when the engine is not at work; it is never used on any other occasion.

13,055. I believe you blast the rock?—Yes.

13,056. Have any accidents occurred from blasting?—We have accidents frequently, but they are almost all attributable to the carelessness of the men.

13,057. Do you know how these accidents occur generally?—They frequently occur from the men using an iron rammer, as they call it, instead of a wooden rod, which we provide them with to push the powder in. There are many small cavities in the iron ore, and the iron is very apt to strike fire by hitting the edges of those cavities. When the men seize hold of an iron rod instead of a wooden one to push in the powder it explodes the powder and their faces are injured.

13,058. They require to use an iron rod I suppose for tamping?—Yes.

13,059. What do they put in on the top?—They put in clay, which is found in the mines. There are large cavities, which are filled with very fine clay, that clay is cut into oblong pieces, sent up and dried on the boilers, and when it is dried the men use it for tamping.

13,060. And in that process there is no fear of any explosion?—No, unless the pricker happens to strike fire against the bottom of the hole.

13,061. Is that made of copper or iron?—We use iron, we have tried a copper one, but on account of the great number of small cavities in stemming, from the softness of the copper, it is driven into these cavities in the side, and there is great difficulty in drawing it out. We have therefore been obliged to discontinue it, and we now use iron.

13,062. If any metal harder than copper could be found it might answer the purpose?—Yes; I should rejoice to have anything like bronze, or any other metal that would not bend with the tamping or stemming, and that would not strike fire.

13,063. Do you use the patent fuze in your mines?—No; and for the same reason that we cannot use the copper pricker. When the patent fuze is used it is put in with the powder, and the stemming is driven in round the fuze. We have tried it, and we find that the fuze is driven into those cavities in the same way as the copper rod is, and it breaks, that is, the connection between the firing at the end of the powder is broken off from the irregularity of the bore hole. We use a straw filled with small powder instead of the patent fuse, which is put into the hole left when the pricker is withdrawn.

13,064. Why can the fuze not be used with safety?—Because of the nature of the ore, being so full of cavities, and those cavities having very sharp edges, so that if the safety fuze was used, the act of tamping would force the fuze into those cavities, the sharp edges of which would cut it, and thus render it entirely ineffectual.

13,065. How is the straw filled?—The straw is of the same length as the pricker, and that is filled full of very fine powder; it is split at the end, and a match longer or shorter, according as the safety distance may be from the hole, is lighted, and as soon as the fire reaches the straw the powder in the straw explodes and communicates the fire.

13,066. What is the match made of?—It is made of linen rag, generally speaking; the men will take some tallow from the candle and grease it round, so as to cause it to burn; they light the end of it; and according to the distance they have to go to get to a place of safety, so is the length of the match; it is a sort of wick.

13,067. Do the miners make it themselves on the spot?—Yes.

13,068. Have you ever thought of firing the holes by any other method?—Yes; I have given orders for a magnetic machine in London, which I expect will not only be economical but also be the means of preventing many accidents. By that machine I hope to be able to fire half a dozen shots at one time; it can be removed to any distance behind a pillar, and we have many in our mines; the men working it might be there, and by using wires covered with gutta percha, they could fire several shots simultaneously.

13,069. Do you think it would be desirable to fire off many holes at once for the purpose of detaching a larger piece of rock?—Yes, I think that the simultaneous action of six or more shots fired at once would be beneficial as one would help the other, and would bring down a much larger mass of ore than so many single shots.

WHITEHAVEN.

Mr. J. Dees.

1 Oct. 1862.

13,070. Has the experiment ever been tried?—I am not aware that it has, I believe it has been tried in sinking shafts. In sinking shafts the practice has been to get one shot in the centre to throw out a portion of the material, and then to have so many more all round firing them off simultaneously, in order to blast the material out round the centre.

13,071. Have you a very large wall of ore to work out?—Yes, the ore in our mine varies from 20 to 70 feet in thickness.

13,072. Is it all pure ore?—Yes, all of it, it is a solid mass of ore.

13,073. Are there no deads or rubbish to draw out?—No.

13,074. Do you consider the safety cage a very safe mode of carrying?—Yes, I do, there have been accidents with them, but they have occurred when the cages have been neglected. I never heard of any accident occurring when the cage has been kept in good order.

13,075. Are the men in your mines perfectly healthy?—Yes, very healthy indeed.

13,076. Is there any club connected with the mines?—Yes, we have a sick fund and combined with that is a relief fund.

13,077. What do the men contribute?—The men pay 6*d.* a fortnight; and for that we find them medical attendance, both for themselves and their families; for the first six months they receive 8*s.*, a week, and then there is a reducing scale from 8*s.* to 6*s.*, and from 6*s.* to 4*s.* If they are a long time on the sick fund I think the least they get is 4*s.* per week. We pay them every two weeks.

13,078. Is a separate account kept of this fund?—Yes.

13,079. Is the amount contributed by the men sufficient to provide them with these allowances when they require them?—Yes; what the men pay is sufficient, but I will explain that. The banksmen or the pit-top-men, originally received 6*d.* per man for getting out the clay, drying it and preparing it for the stemming; some time ago I thought that 6*d.* was too much for those men; 6*d.* is still taken for it, but one half of that sum only is given to the men who prepare the stemming, the other half goes to the sick fund, therefore the men really only pay 3*d.* a week for the sick fund.

13,080. With this addition the fund is sufficient to meet all calls upon it?—Yes.

13,081. Is there a special doctor attached to your mines?—Yes.

13,082. What is his name?—Mr. John Bateman Wilson.

13,083. Are the miners paid once a fortnight?—Yes.

13,084. Is it your practice to keep back a week's legging as it is called?—No, our books are made up to the Wednesday night, and the men are paid on the Saturday following.

13,085. Are the men paid in gold or in silver?—They are paid in gold, silver, and copper; we never by any chance pay them in notes.

13,086. Is there one man at the head of a partnership who pays the rest?—The men generally work in gangs, varying from 4 to 10 or 12 in a gang, and one man of each gang comes and receives the money for that company or gang; not always the same man each fortnight.

13,087. Is a contract made with the men by the ton?—We pay them by the ton.

13,088. When is the ore weighed, as it comes to the surface?—Each of our bogies contains so much, and a certain number of those bogies constitute a ton. The men put in a wooden ticket with their number in each bogie, and a man at the top takes it out and puts it into the receptacle for that number. Five constitute a ton, and as soon as 5 are accumulated in their pigeon hole, the man at the top marks down a ton for the miners.

13,089. Is the weight taken according to measurement?—Yes, a bogie full of ore was weighed originally, and that serves as a guide for each pit.

13,090. Is the ore sent away in railway waggons?—It is; we have a railway to each of our pits, and the ore is put into the waggons at the pit.

13,091. Is the ore weighed in the waggons?—Yes, and the railway waggons are weighed empty; we have a weighing machine on our own railway, as the waggons go to the mines they are weighed, and when they come back they are re-weighed; of course tare is taken of the waggon, and an accurate account kept of the quantity.

13,092. About what do you pay per ton to the men for working?—The price varies very considerably.

13,093. What is the cause of the variation that takes place in the prices that you pay to the miners?—It is on account of the hardness or otherwise of the place in which they are working. There are some places in our mines that would cost twice as much labour to work in as in others.

13,094. Is the price settled every fortnight?—No.

13,095. How often is it settled?—It is left very much to the underground steward as to the nature of the working, whether it is getting harder or softer; there is always a fortnight's notice given; but sometimes the same price will continue for a couple of months. We rely upon the judgment of the underground steward.

13,096. The price is not regulated by competition among the men?—No.

13,097. Will you have the goodness to state the highest and the lowest wages which the miners earn?—There are some of our men who get upwards of 30*s.* a week, and others of them do not get more than from 16*s.* to 18*s.* a week, but then that varies. Perhaps there is one man who is getting 18*s.* for one fortnight, and in the next fortnight, if the place gets better to work, he may get as much as 25*s.* I think that the average is about 22*s.*

13,098. What deduction is made from that for candles?—I think that the price for candles is 7*d.* a pound.

13,099. Are they limited to any particular quantity?—No, they can get as many as they like.

13,100. Do the miners ever take them away or use them at their own houses?—I am not aware that they do, but I think not; they are small candles.

13,101. Whatever they may pay for candles and for powder it comes out of the price that you pay to them per ton?—Yes, it does; but the wages that I stated the men earned are quite independent of all these out-takes; that is the net wages, the 22*s.*, after all deductions are taken out.

13,102. What deductions are made besides for powder and candles, and the club, or are there any?—Yes, they pay for sharpening their tools.

13,103. Is the wear and tear of the tools taken into account, and are they weighed?—No; when they first begin to work the place they have a set of tools given to them; the most expensive of them are the drills, which are made of cast steel, and before the miners can get a new one they must bring the short one in; but there is no deduction made for wear and tear; if they lose one they must pay for it.

13,104. Have the candles which the miners use a cotton wick?—Yes.

13,105. If a candle with a cotton wick goes out, is there not some difficulty in blowing it in again?—I never heard of any difficulty.

13,106. I suppose they all use candles with cotton wicks?—Yes, so far as I am aware.

13,107. Have you never seen a candle with a mixed wick in use?—No, I have not.

13,108. Do the miners reside near the workings?—We cannot get lodgings for all of them, but as many as we can get places for do, and we are very glad of it; but some of them have to walk as far as three or four miles, but only a few of them now. The houses are very much increasing in the neighbourhood.

13,109. Have you built some houses for the miners to live in?—Yes, I have built in the neighbourhood about 25.

13,110. What do you let them to the miners for?—The men pay 2*s.* 9*d.* per week.

13,111. Do the houses in which they lodge consist of four rooms?—Yes; and there are conveniences outside of each house, such as a privy, an ash hole, a coal house, and a sink; the whole of the premises are thoroughly drained.

13,112. Are there any schools for the children?—There are schools in the neighbourhood.

13,113. How are they supported?—The schools are supported by the contributions of the workmen themselves.

13,114. Are there any deductions made for school fees?—Not in our case.

13,115. (*Mr. Austin Bruce.*) Do you ever receive any complaints from the men as to the management of the works?—No, we have been extremely free from complaints. We had a manager who understood his business well, and he had been with us between six and seven years, but was addicted to drinking; he was several times warned, and at one time a reduction was made from his wages; but we found that the habit had become so strong upon him that he broke out upon one occasion more than usual, and we discharged him; and some of the men, who we found afterwards were some favourites of his, incited the rest of the men to strike, and they were trying to compel us to take the man on again whom we had discharged; but we gave them notice that if they did not go to their work in 12 hours we should not employ one of them again. Within 12 hours we had more than half of them at work; we have never had any complaints as to wages.

13,116. Have any other accidents occurred besides those arising from the blasting with powder?—We have had two or three accidents which arose from the incautiousness of the men getting on to the cage after it had started; they did not get fairly into the inside, and were caught against the framing of another eye above; we have had two accidents of that sort, and accidents from falls. Sometimes when the miner's have fired a blast they were not sufficiently careful to take down the ore that had been loosened, and it came down upon them.

13,117. At what age do the miners generally commence to work underground?—I do not think we have any man who goes to work underground under the age of 20; we have a lot of boys who work at the surface.

13,118. Up to what age, under ordinary circumstances, are the men able to continue working underground?—We have men working at the age of 60. I do not think there are any older than 60.

13,119. Do you consider that the miners are, on the whole, a healthy body of men?—Yes; I think they are extremely so.

13,120. Do you think they are as healthy as those who work aboveground?—I think they are quite as healthy; they are a very robust body of men.

13,121. Have you ever known any instance of a man suffering from any complaint that you could connect with his employment as a miner?—Not a single instance.

13,122. (*Mr. Holland.*) Are you sure that they are not more liable to any disease of the lungs than other men?—No; I think not.

13,123. (*Chairman.*) Do you adopt any particular mode for ventilation?—We have a connection between all our pits, and the air has a free course through from one to the other.

13,124. While working the pit, have you never had any place where the air has been dead or poor?—We have in one solitary instance I think; we had to put up what we call a brattice in the middle of the drift to get a connection with another portion so as to get connected with another shaft, and that effectually cured it.

13,125. Was this drift through the ore or in the rock?—In the ore.

13,126. (*Mr. Holland.*) Are you sufficiently acquainted with the men of this district to speak generally of their health?—I think I am.

13,127. You say that generally they are a healthy class of men?—I do, and I think it is quite borne out by our own medical man's reports. I think that the iron tends to preserve health; that it gets into the system; it certainly does not injure it.

13,128. (*Mr. Austin Bruce.*) Is the system of working the mines the same in all the mines in the neighbourhood of Whitehaven?—I think it is. The mines vary; in our case the ore is almost stratified, but that is an exception; in the generality of mines it is found in veins, which lead to what are called sops. A place may be found as large as this room, then will come a narrow vein leading to another sop. We have the mines all connected; it is not stratified rock, but in our case it is stratified to a certain extent; it has a regular dip, and leads from No. 1 pit to No. 3; we generally work it in three levels; we begin at the top, leaving a table of ore between that and the second working, another table between the second and third, which is on the bottom.

13,129. What is the number of separate mining establishments in this neighbourhood?—I cannot state off hand. Mr. Hunt's book, I believe, tells it correctly. I think that there are 23 mines, if I recollect rightly.

13,130. Under 23 different proprietors?—No; some proprietors have mines in different parts of the country.

13,131. Are all these mines in the hands of resident proprietors?—Very extensive mines belonged to the late Mr. Hill of Plymouth, but with that exception they all belong to resident people.

The witness withdrew.

THOMAS AINSWORTH, Esq. examined.

13,132. (*Chairman.*) What are the mines in which you are interested?—The Cleator Iron Ore Company.

13,133. Is the description of the ore in the mines the same as at Parkside?—Yes; the hematite ore.

13,134. Have you ever been into the Parkside mines?—No.

13,135. Can you tell whether the ore is worked in the same way?—Yes; I think that all the hematite ore in this district is worked nearly in the same way.

13,136. What is the quantity of ore raised at Cleator?—We raise from 800 to 1000 tons a week.

13,137. Is the taking out of the ore let to the men by the ton?—Yes.

13,138. Do you know what deductions there are from the price which you pay the men per ton?—They pay for their own powder and candles, and sharping and shafting gear.

13,139. Do they pay to any sick club?—They have a doctors club; they stop so much out of their wages in the office, and this is paid over to a doctor who attends them, who is settled in the parish.

13,140. What is the name of the doctor?—Dr. Thompson.

13,141. Is there any allowance to the men out of that fund when they are off work from sickness?—No; we formerly did that, and we found that we were so much imposed upon, and that the really good men had to suffer for the indiscreet men, that we gave up the sick fund.

13,142. So that there is now no allowance for a sick man, but the doctor attends him?—Just so.

13,143. Does he attend his family or only himself?

WHITEHAVEN.

T. Ainsworth, Esq.

1 Oct. 1862.

—He attends the family. Any one of the family under 14 years of age being ill the doctor attends.

13,144. What price do the men pay for candles ?—They pay the price which we contract for. We make a large contract, and they get them at the same price.

13,145. And the same with powder ?—And the same with powder.

13,146. What is the payment per week for the doctor ?— I am opposed to that system inasmuch as the men never think that they are well attended if they pay in advance, and the doctor sometimes is not able to satisfy them even by the best attendance. Therefore I object to it upon principle, but the clerk collects the money from the men and pays it over to the doctor at their wish, but it is in opposition to my own wishes.

13,147. By whom is the doctor appointed ?—By the men. I have nothing to do with it.

13,148. Do you not think a sick club an advantage? —No ; I have found it in my experience to work badly. The health of the dissolute and the bad men is naturally worse ; they are more frequently on the sick club than discreet and good men, and therefore I have always told them that I think it is a disadvantage to the honest and the upright and the good men and a premium upon indiscretion and dissolute conduct.

13,149. The men are not obliged to contribute to the doctor unless they like ?—No ; I place no restriction. I say, " This is your own affair, and you " must manage it in the most satisfactory way to " yourselves."

13,150. Do all the men contribute ?—In the iron ore pit I believe they all contribute to the doctor. In the coal pit I know that there is a difference of opinion, and that some do not contribute to the doctor. I subscribe to the Infirmary ; I also subscribe to the Eye Institution in Liverpool ; and I also subscribe to the Harrogate Baths, so that if an accident happens they are taken care of in the Infirmary, if they choose to go there. Sometimes they have an eye accident from the explosion of shots, and I then get them into the Eye Institution at Liverpool. They also have the benefit of having the Harrogate Baths free if they can pay the expenses of their journey there and their return.

13,151. Do the men reside near their work ?—Very generally, as I have a good many cottages of my own.

13,152. How do the men go down ?—We have safety cages attached to the pits.

13,153. Have you had any accident with the safety cages ?—The only accident that we ever had was through the indiscretion of the under steward and the person who had charge of the cages at the top. The instructions are, presuming that this is the ground level, and that this is the pit head level, that no man is allowed to get on at the top of the pit ; he always should be made to get on at the ground level. The underground steward and the man who had charge of the cage were going down the pit, and they drew up the cage to the pit top, and both got in there. Instructions were then given to the engine man to start the engine, and in doing so, he reversed his engine, drew the cage against the top, it was detached from the rope, and the guides which should have acted did not act, it being frosty weather ; the slides were frozen and the two poor creatures went down to the bottom and were killed. If they had obeyed the instructions which were issued, that they should only get on at the ground level, the accident would not have happened.

13,154. Then in frosty weather when the guides were above the ground, the safety catch did not answer ?—It did not answer there, and also down the pit, because the draught of air up the pit and down the pit was pretty strong, and the slides themselves were frozen. It was the water from the pumps in this case which had frozen.

13,155. (*Mr. Holland.*) Did it go rapidly down ? —Yes ; that is the only accident which we have ever had.

13,156. (*Chairman.*) How do the accidents from blasting happen ?—It is the men's own fault.

13,157. In what way is the accident principally brought about ?—We insist upon them all using copper prickers ; they say that they cannot work with these copper prickers. We profess only to supply copper prickers ; they have iron prickers and they also use iron stemmers.

13,158. Do you supply them with pointed copper stemmers ?—No.

13,159. We have been told that the copper pricker, owing to the nature of the cavities in the ore and the edges being sharp, does not answer ?—A copper pricker is very liable to be bent and to be twisted, and perhaps worn away ; but if the men would be more careful, if they would not wish to do ten minutes' work in five minutes, and would take a little more time, I do not think that that would happen.

13,160. But the copper being a softer material than the iron gets bent ?—Yes.

13,161. (*Mr. Austin Bruce.*) You say that you employ men in collieries as well as in mines ?—Yes.

13,162. Where are the collieries ?—They are here in the same parish with the mine.

13,163. Do you observe any distinction between the conduct of the one and the other set of workmen ? —I think that the iron ore miners are more respectable than the colliers.

13,164. To what cause would you attribute that ? —The trade of this district has developed so rapidly lately that there is a great deal of imported labour and a great deal of new labour which goes into the collieries as Irish labour, and therefore you have generally speaking an inferior class of work people to deal with. In the other case the persons who work in the iron ore mines are made up from the agricultural labourers of the district, and therefore they are a better class of men originally.

13,165. Is the employment equally regular in the collieries and in the mines ?—Yes, we are always able to give them labour.

13,166. Do the men ever make any complaints to you of the management underground ?—No, I have never had any complaint.

13,167. Have you ever known any dissatisfaction to exist among the workmen ?—I have had no complaint, and therefore I could not say that I know of any dissatisfaction.

13,168. You have had no strikes ?—I do not think that I have had one strike, I do not remember it.

13,169. Your workmen, I suppose, are like the rest in the district, they come to you when they are full grown ?—I was just asking that question to-day ; having a mill also, we there have the educational question introduced, and I never wish any boy to be employed in the mine till he is above 13.

13,170. Do you begin to employ them in the mine as early as 13 ?—Yes. We have very few boys in the mines: in the iron mines I do not suppose that we have above one or two ; in the colliery there are more, and there the workpeople are a greater distance from the works, and therefore we have not the same control over the children.

13,171. Have you ever observed that the iron ore miners suffer from any special complaint which might be attributed to their employment ?—No ; I think that it is a very healthy occupation.

13,172. (*Mr. Davey.*) What is the difference in the wages between your colliers and the miners ?— The men go from one to the other, so that there is very little difference with us, I think, between a miner's wage and a collier's wage.

13,173. You have stated that you think that the miners are generally a better class of men than the colliers ?—Yes.

13,174. Is there any difference in the wages to account for that ?—No. Among the colliers there are what they call trailers and inferior men, men who trail the coal to hook it on to the engine after it has

been hewn. There is a good deal more of that sort of work in a colliery than in an iron ore mine.

13,175. (*Mr. Austin Bruce.*) Have you not something equivalent to trailers in the iron mines?—Yes; but we have a fewer number of trailers in the iron mines than in the coal mines. An accomplished collier and an accomplished miner would, I think, get nearly the same wages.

13,176. (*Mr. Davey.*) How is your mine ventilated?—We have shafts; where we have very long workings we divide the air as you would in a colliery.

13,177. You brattice it?—Yes. The manager of my iron mines was formerly the manager of my coal mines, and therefore, where it is necessary, we provide them with bratticing.

13,178. (*Mr. Holland.*) Do miners look older than other men of the same age?—No; but they look a little paler.

13,179. (*Mr. Austin Bruce.*) Do you ever have any accidents at your collieries?—I think that we have only had one accident resulting in death, and that, I think, was above ground.

13,180. Have you ever had an explosion?—Never.

The witness withdrew.

Mr. ARCHIBALD BELL examined.

13,181. (*Chairman.*) You are manager of the Cleator Iron Ore mines?—Yes.

13,182. Can you state the number of men employed there?—Sixty-four.

13,183. How many of those are under ground?—We have 60.

13,184. Do you make any particular allowance of candles?—No, we leave them to purchase their candles; we supply them at the works.

13,185. But they are not obliged to take them from you?—No; we are often out of candles, and the people may go where they will for candles.

13,186. Is it the same with the powder?—Yes, we supply it. It is the wish of the miners for the Company to provide these things for them, and when it is a wish of theirs of course we let them have them from us.

13,187. With regard to ventilation have you ever found that the candles will not burn in a drift?—No.

13,188. Then you have never had to apply any artificial mode for ventilating the iron ore mines?—No.

13,189. How many shafts have you?—We have two shafts in operation now.

13,190. What is the distance underground between each shaft?—The shafts are not both sunk to the one seam.

13,191. What is the deepest?—Forty-three fathoms.

13,192. And what is the shallowest shaft?—Twelve.

13,193. Was the 12-fathom shaft sunk for the purpose of ventilation or for the purpose of getting ore?—It was sunk in the first place for the purpose of getting ore.

13,194. Is it still used for that purpose?—Yes.

13,195. What is the distance between those two shafts?—It is, I think, somewhere about 20 yards.

13,196. Is there any communication between them?—There is a drift put through from the deepest pit to the 12-fathom shaft going up to it.

13,197. And that answers the purpose of ventilation without any artificial means?—Yes; we have a division in the pit, the air coming down the one side and returning up the other shaft.

13,198. Does it always go up the one shaft?—Sometimes it will take a turn. A bogie will very often turn the air in going down and put it in its right course again.

13,199. You blast?—Yes.

13,200. Have you had accidents by blasting?—There has been one since I came to the place.

13,201. Could you trace the actual cause of that accident?—So far as I could see it was from tamming in the ore.

13,202. The rod struck fire?—I think so. I could trace it to nothing else.

13,203. Do you use the safety fuze?—Yes, where it is wet; but we use a pricker where it is dry.

13,204. Do the men prefer the pricker?—Yes.

13,205. Is there any reason why you should not use the safety fuze when it is dry?—With the little cavities perhaps you might go through two or three of those before you had a blast, and if you put the safety fuze into these cavities it very likely might be cut through.

13,206. (*Mr. Kendall.*) Have you had any strikes in your mine?—Not since I came.

13,207. How long have you been there?—Two years.

13,208. The men are very healthy?—Very healthy indeed.

13,209. Do they go down at stated periods?—Yes.

13,210. Supposing that they disobey any of your rules, have you a system of fines?—If they disobey the rules I let them be away for a few weeks and then perhaps take them back again.

13,211. You find that that is a better system than fines?—Yes.

13,212. You do not like fines?—No.

13,213. And they would not like it?—No.

13,214. They are very independent, are they not?—No, I think not; the people are reasonable enough. Some of them are, and some of them are otherwise.

13,215. Taking them as a body they are very amenable to orders?—Yes.

13,216. Do they save much money?—I cannot say.

13,217. Their wages are good but they spend freely?—Yes, in too many cases.

13,218. As far as the families go are they fairly taken care of?—Yes, so far as I am aware. The men are in general from all countries, Cornwall, and Scotland, and Ireland; they are mixed up.

13,219. You have a frequent change of hands?—Yes.

13,220. And that does not enable you to speak as to the family?—No; because a man, perhaps, may go away after having been with us for three or four months.

13,221. (*Mr. Holland.*) Is there any peculiar disease among the miners?—No; I cannot say that there is.

13,222. Are they peculiarly liable to any cough or difficulty in breathing?—No, they appear all to be pretty healthy.

13,223. Do they look older than other men of the same age?—I do not think they do; they look fresh.

The witness withdrew.

Mr. JOHN BATEMAN WILSON examined.

13,224. (*Chairman.*) Have you been long the medical attendant of the Parkside mine?—Between six and seven years.

13,225. Very nearly since the commencement?—Very shortly after the commencement.

13,226. Have you other practice in the neighbourhood besides?—Yes, that is only a portion of it.

13,227. Is there any particular illness to which the men at Parkside are liable?—There is no particular illness.

WHITEHAVEN.

Mr. J. B. Wilson.

1 Oct. 1862.

13,228. By the arrangement with the Parkside managers, do you attend the men alone or their families also?—The men and their families. I do not attend the wives in midwifery, it would be too great a task to undertake that, but I attend in all other cases the families until they are 14.

13,229. Are accidents the principal causes of your attendance being necessary?—There are accidents which I attend, and there are the usual class of illnesses. A good deal of stomach complaints from, perhaps, improper living and intemperance at times. Then again the complaint to which miners are more subject is rheumatism, from the sudden changes of temperature, coming out of a warm mine, and having to walk four or five miles, some of them, to their houses. The change of temperature sometimes in wet weather produces rheumatism, which is the malady to which they are most subject.

13,230. Do they change their clothes when they go in and come out of the mine?—Not till they get home.

13,231. They do not change on the mine?—No; they generally have with them a kind of upper coat as a protection to put on when they come out, a kind of waterproof which they take with them; nearly all of them, I think, are provided with that, which they leave when they are at work. I dare say, that in a general way, if the mine is very warm, they have scarcely anything upon them but their flannel vest.

13,232. Have you ever been down into the mines?—I have not.

13,233. In this neighbourhood, should you say that there is any endemic disease?—No, we are particularly clear of that, but I am afraid that in the course of a few years we shall be subject to it, because there is such inattention to sanitary regulations in the building of new residences. They are nearly all new residences which have been built for the miners, which is quite a new feature in this small locality. There are thousands where there were only dozens before, and there has been so little attention to sanitary regulations, that I am afraid that as we find a kind of cycle of these complaints, in the course of time some of the places will have some very sad outbreakings of cholera and fever.

13,234. Would that be from overcrowding or the ill-construction of the dwellings?—The ill-construction of the dwellings and the want of drainage in front of the dwellings.

13,235. There is no provision for getting rid of the refuse thrown out from the house?—Not any provision; in fact, that seems to be a very great want here, and it will at some time be very serious.

13,236. Is there no sanitary board?—The sanitary board at present is a very inefficient one, it is under the surveyor of highways, and partly the guardians of a country district. These persons do not expend money very willingly; I have experience in that way, because I am a guardian of this union, and have always taken an interest in sanitary matters, and should have liked to have seen these matters carried out, but I find that the law is insufficient.

13,237. Have you represented this?—I have not had occasion lately to do it, but I have done so more particularly as a guardian, not on account of these mines, but in the same locality, when an old Act was enforced, when it was more under the Board of Guardians. Now there is some difficulty in carrying it out.

13,238. (*Mr. Austin Bruce.*) You have stated that on the whole miners are more subject to rheumatism than the rest of the population?—I do not know that there is much difference per cent. if you apply the statistics in that way; it is what nearly all the labouring classes are subject to, but I think that perhaps, if anything, the iron ore miners have a greater proportion per cent.

13,239. Would not the continual exposure of the agricultural labourers to all sorts of weather make them as much liable as the occasional exposure of the miners to changes of temperature?—No, I think not; I have not observed it with that frequency amongst them. An agricultural labourer goes out pretty well protected generally about his feet, and he is not so subject to cold, and he is out for a short time, he comes in, and if he gets very wet, as he is not far from home, he can change directly. The miners perspiring freely for six or eight hours, and having, some to walk four or five miles, and some two miles through perhaps a heavy rain, get wet and chilled before they get home, consequently there is more exposure than in the case of a person working all the day through.

13,240. Have you observed whether a miner is more subject to diseases of the lungs?—No, I do not think that we have had more diseases in proportion.

13,241. In recovering from illness, is there any difference between the mining and the agricultural labourer?—An agricultural labourer in general is a steadier man, his habits are not so unsteady as those of a miner; it is that which makes the difference. I do not think that it is the employment.

13,242. Do you attend any collieries?—I do; I attend the greatest portion of the colliers working in Lord Lonsdale's coal mines here.

13,243. Do you observe any difference in the physical condition of the colliers and the miners?—I think that the iron ore miners as a body are healthier.

13,244. To what do you attribute that difference?—I account for it in this way; that they are perhaps stronger when they begin to work. Some of those who work in coal mines begin to work at a very early age, and their system does not get so well developed. A great proportion of the iron ore miners are persons who have been agricultural labourers before, and they perhaps do not go into the mines until they are 22, 24, or 25, or until they marry. In this part of the country the agricultural labourers live in the houses of the farmers, and they are hired by the half year; there are very few out-door agricultural labourers in this district. It has been a great boon to these men to go into the iron ore mines, and to make much better wages, and their families are more comfortable than if they had remained as agricultural labourers.

13,245. The going into a mine enables a man to set up his separate establishment?—Yes.

13,246. At what age does a collier here go to work?—Most of the boys begin, I think, at 10; I think that that is the regulation fixed by Government in the regulation of mines. They generally go in as drivers.

13,247. Have you observed any difference in the ages between working miners and working colliers?—The iron ore mines in this locality have not been worked to any great extent for that number of years; I know some of them who are above 60, who have been working perhaps for 10 or 15 years in the mines, but I can scarcely bring instances where a person has been working 30 or 40 years as I could in the coal mines.

13,247*a*. Do you know instances in the coal mines of men who have been working 40 or 50 years?—I do.

The witness withdrew.

Mr. GEORGE DIXON examined.

Mr. G. Dixon.

13,248. (*Chairman*). I believe that you have several mines under your charge in Cumberland?—I have.

13,249. What description of mines are they?—Iron ore, coal, and lead mines.

13,250. Can you state the names of the iron ore mines?—The Winder and Yeathouse iron ore mines.

13,251. Where are they?—In Frizington in the district of Parkside.

13,252. (*Mr. Kendall*). All in this county?—All in this county.

13,253. (*Chairman*). Where are the lead mines?—In the Keswick district.

13,254. Will you give the names of them?—Gold scope, Brandelhow, and Force Crag.

13,255. Can you state about the number of men in the iron mines?—I act as mining engineer to the iron mines, and as lessor's agent to the lead mines. In the Yeathouse and Winder mines, which are worked under the same firm, but are two separate and distinct mines, we employ 156 hands underground, and 26 surface men, making a total of 182 men.

13,256. Are those iron mines worked in the same manner as the Parkside and the Cleator mines?—Generally they are.

13,257. Can you point out any difference in the working of those mines?—I could not point out any essential difference. The produce is about 120 tons per day for that number of men.

13,258. How are the bargains made with the men, by ton or by piece work?—By ton.

13,259. They work in parties of how many, generally?—Parties of from three to six. These parties are called companies of men.

13,260. Are the bargain and payment made to one man?—Yes. The depth of the pits is from 30 to 40 fathoms. In each of the mines there are two distinct shafts for the purposes of ventilation and working.

13,261. (*Mr. Kendall*). Connected with the same vein?—Yes.

13,262. And communicating one with the other?—Yes. The lateral extent of working is from 200 to 300 yards, transversly, perhaps, 40 to 60 yards.

13,263. (*Chairman*). What is the highest and what is the lowest amount which the men can earn at the prices which you pay per ton?—The prices paid per ton vary very considerably with the nature of the particular work in which the men are engaged. The average rate of wages may be taken at something like 3*s.* 2*d.* to 3*s.* 4*d.* per day. I think that that is our last fortnight's average.

13,264. Can you tell what was the lowest and the highest?—I cannot; that is about the average.

13,265. Are the wages of the men the same as in the neighbouring mines?—They are about the same.

13,266. Do the men change much from one mine to the other?—The young men do, but the married men with families do not change much.

13,267. Do they reside in the neighbourhood of the mines?—They do.

13,268. What is the furthest distance from the mine at which they reside?—Some of our workmen I dare say travel three miles to and from their work, but not many of them now.

13,269. Are houses being built for them?—Yes; and great numbers have been built within the last 10 years.

13,270. Who are the parties who build them?—Generally independent parties.

13,271. Do you know what rent the men pay?—From 2*s.* 6*d.* to 3*s.* a week.

13,272. Are the houses commodious and well built?—They are generally houses containing two downstairs rooms and two upstairs rooms with small back premises.

13,273. Do they take in many lodgers?—I can scarcely answer that question.

13,274. (*Mr. Kendall.*) I understand from you that you have got two shafts, one at each end of these 300 yards' workings?—Not at each end.

13,275. I am right in supposing that your main working is about 300 yards long?—Yes.

13,276. And that you have a transverse working of about 60 yards?—Yes.

13,277. In the 300 yards you have two pits; whereabouts are they situated?—The extent of workings in one case to the dip of ore pit is 400 feet and to the rise 250 feet from the other pit.

13,278. Are the transverse workings as well ventilated as the long workings?—Yes, we put stops in and carry air boxes which can supply any amount of air. We make use of those when necessary.

13,279. You find that by these divisions and trap doors, and so on, you can convey a draft when you like without any fans?—Yes; sometimes in long drifts, when there is no communication with any other workings, we put in a fan.

13,280. In the course of the year have you a fan working three months?—No.

13,281. How many fans do you use?—We never used more than one fan.

13,282. And perhaps upon the whole you use it one month out of twelve?—No, it is very seldom used at all.

13,283. Generally speaking the ventilation is as good as can be?—It is.

13,284. (*Mr. Holland.*) When did you work the fan last?—Four or five years ago.

13,285. (*Mr. Austin Bruce.*) You have no difficulty with the ventilation?—None whatever.

13,286. Do you conduct it on the same principles as the ventilationof the collieries with which you are connected?—Generally speaking so. Of course we have not the same opportunity in an iron mine as in a colliery; the workings in a colliery are a great deal more regular, laid out with regular boards and headways.

13,287. In the iron mines have you a regular upcast and down-cast?—Yes.

13,288. Does the return air always pass up the same up-cast shaft?—Yes; it cannot get to the other.

13,289. (*Chairman.*) Why?—Because it is occupied by the down-cast air.

13,290. (*Mr. Austin Bruce.*) You have so arranged it that the up-cast shall always be the up-cast and the down-cast the down-cast?—Yes.

13,291. Is that usual in the mines in this neighbourhood?—I can scarcely answer that question.

13,292. What means do you take to conduct the air so as to secure the same up-cast and down-cast in all temperatures of the outside air?—In each of the mines of which I am now speaking, namely, the Yeathouse and Winder mines, we happen to have an underground engine; and the discharged steam is carried to the up-cast shaft in both cases, which of course secures that particular result.

13,293. Do you take much pains to prevent the leakage of air into any other than the proper channels?—We do not find it requisite at all.

13,294. Not to the same extent as in collieries?—Certainly not.

13,295. Is the stream of air which you send through the iron mines equal in volume to that which you send through collieries?—That depends altogether upon the extent of workings.

13,296. I mean supposing other things equal?—I should say that as great an amount of atmospheric air goes into our iron mines as goes into collieries.

13,297. Are there not fewer impurities to struggle with in the mines than in the collieries?—Yes.

13,298. Do you observe any difference between the health of miners and of colliers?—None whatever.

13,299. Are both healthy?—Yes.

13,300. Are your collieries liable to explosion?—Some of them are.

13,301. Any with which you are connected?—Yes.

13,302. Have you had recent explosions at any of them?—About two years ago we had an explosion.

13,303. A fatal one?—Three or four lives were lost.

13,304. Do you trace any difference in wages between the colliers and the miners to the fact of the greater danger of working collieries?—None whatever.

13,305. (*Mr. Davey.*) What is the position of your up-cast shaft; is it higher at the surface than the down-cast shaft?—We do not find it necessary to make it any higher.

WHITEHAVEN.

Mr. G. Dixon.

1 Oct. 1862.

13,306. In your particular instance is it higher. You have two up-cast shafts; are they nigher at the surface than the down-cast shaft?—In one case the up-cast shaft is higher, in the other it is not.

13,307. (*Mr. Holland.*) Are your lead mines as healthy as the iron mines?—Certainly not. I may state that I am not practically acquainted with the management of any lead mines, but merely as lessor's agent.

13,308. (*Mr. Kendall.*) Do you descend them at all?—Yes.

13,309. (*Chairman.*) Which is the largest of the lead mines with which you are connected?—The Goldscope in the vale of Newlands.

13,310. How do the men enter the mine?—By levels and by shafts.

13,311. Are there many shafts?—Two; they enter by the level, and then they descend a shaft below the adit level.

13,312. Do they go by ladders?—Entirely by ladders.

13,313. What is the width of the vein at the Goldscope mine?—I can scarcely state it; it is an irregular sop or pipe of ore that they work in at present.

13,314. Can you state about the quantity of ore raised?—At Goldscope I should think from 400 to 500 tons of ore in a year, and at the Keswick mines perhaps 300; I am speaking generally.

13,315. Are these mines worked by blasting?—Principally by blasting.

13,316. What is the rock?—Clay slate.

13,317. Are the drifts driven far from the shafts or from the day?—I should think that the extent of drifts and workings may be assumed at from 300 to 400 yards from one extreme to the other.

13,318. Is there any difficulty then in supplying the men with air when they are driving a drift?—I have never seen any myself.

13,319. Have you any artificial means for supplying them?—I think that at the Goldscope mine I have seen them use zinc air pipes in some of their long drifts, and the ventilation is produced by what they call a water blast, the falling of water.

13,320. Do they report to you when anything is necessary in the way of ventilation?—No.

13,321. That is left entirely to the manager?—It is.

13,322. Are the men healthy?—Generally speaking.

13,323. Do you know of any peculiar illness to which they are subject?—They are sometimes subject to some disease in the lungs, I fancy caused by breathing stone dust produced in the process of working.

13,324. There is a good deal of dust?—Yes.

13,325. Do the men suffer at all in the smelting houses?—I am not acquainted with the smelting.

13,326. The ore is taken away without being smelted?—It is taken to Newcastle and into Wales I believe; it is sold to those places to the smelting houses.

13,327. (*Mr. Kendall.*) What is the condition of the lead miners; do you think that it is equally favourable as that of the iron miners?—I do not think so. I do not think that it is so healthy an occupation as in the coal and iron mines.

13,328. Do you see a difference in their looks?—Yes.

13,329. Do you think that they work as old as the others?—You will find occasional cases of very old lead miners, but they are exceptional.

13,330. Taking the lead miners as a body, do you think that they work as old in life as the iron miners?—I can scarcely answer that question.

13,331. Are the wages of the lead miners as great as the wages of the iron miners?—No.

13,332. What is the difference?—I think that the lead miners do not earn more than 18*s.* a week on the average.

13,333. Do you think that the ventilation is as good in the lead mines as in the iron mines?—Yes; I think that in those with which I am connected it is.

13,334. Do they carry on the same system of club money in the lead mines as in the iron mines?—We have no clubs in the mines with which I am connected.

13,335. If the men are sick will they fall on the union?—They will fall on the union I suppose if they have no other means.

13,336. Have you ever tried a club?—We gave the men an opportunity of doing so, and we left it to themselves voluntarily to adopt it, but they did not choose to adopt it; we recommended them to do so.

13,337. Have you got any medical man attached to the mines?—No. Our overmen strongly recommended the men to adopt that system, but they refused; we did not, of course, choose to employ any unnecessary pressure upon them; we left it perfectly free.

13,338. (*Mr. Austin Bruce.*) Are there any special difficulties in ventilating lead mines?—No, none that I am aware of.

13,339. Whence does the dust which you speak of as affecting the lungs of the miners in lead mines arise?—I suppose from the character of the rock, the mineral itself in which they work.

13,340. Is it after blasting?—Not after blasting, but in the picking and the general working in fact. They are breathing an atmosphere charged with a certain amount of heavy dust coming from the rock in which the lead is deposited.

13,341. Is there any vapour or gas?—No, there is no deleterious gas that I am acquainted with.

13,342. To what do you attribute the fact that a miner in lead mines earns less wages than a miner in iron mines or a collier?—I fancy that they have been brought up to that particuler class of work; they have settled themselves in a particular locality, and I do not think that they have a great idea of removing; some few of the young men come here into the iron ore district.

13,343. As a class are the lead miners as well conducted as the other miners?—Yes, I think that generally they are.

13,344-5. (*Mr. Davey*) What effect has the dust, which you speak of, upon the breathing of the men?—I could not answer that question, that is more perhaps a medical question, I am only speaking generally.

The witness withdrew.

Adjourned to To-morrow at Coniston.

CONISTON.

Thursday, 2nd October 1862.

PRESENT :

The Right Honourable Lord KINNAIRD, K.T.
NICHOLAS KENDALL, Esq., M.P.
H. AUSTIN BRUCE, Esq. M.P.
RICHARD DAVEY, Esq., M.P.
P. H. HOLLAND, Esq.

The Right Honourable Lord KINNAIRD, K.T., in the Chair.

Mr. JOHN BARRATT examined.

13,346. (*Chairman.*) In what mines are you interested in this neighbourhood? — The Coniston mines.

13,347. Are they near Coniston?—Yes; and there is another called Tilberthwaite.

13,348. What is the total number of the men employed in these mines?—Of men and boys there are about 350 employed.

13,349-59. How many are employed underground?—I have taken them out, and the number will be shown in this paper.

The following paper was handed in:

Number of men employed at Coniston Mines.

Number of pickmen	-	-	150
„ pitmen, &c.	-	-	7
„ machine-men	-	-	3
„ waggoners, fillers, &c.		-	27
			—187
Employed at surface dressing:			
Number of men	-	-	26
„ boys	-	-	82
„ girls	-	-	18
„ overlookers	-	-	4
			—130
„ carpenters	-	-	5
„ smiths	-	-	7
„ masons	-	-	3
„ carters, &c.	-	-	4
„ agents	-	-	5
			— 24
			341

13,360. What description of ore does the mine produce? — Copper. The number of men employed shown in the paper I have handed in includes six men who are employed in Tilberthwaite; but it is all one company.

13,361. What is the deepest level at which you are working?—The deepest level is 150 fathoms at the old engine shaft, under the adit, and the adit is about 50 fathoms.

13,362. How many shafts are there?—On the old mine there are two shafts, the new engine shaft is 180 fathoms west of the old engine shaft.

13,363. How many fathoms are there between each of those shafts?—180.

13,364. How do the men descend into the mines?—By ladders.

13,365. Do they go in at the adit level?—Yes, and then they descend.

13,366. How many levels are there?— The levels are driven apart as follows, viz., the 20 fathoms, 35 fathoms, 50 fathoms, and 70 fathoms; and from the 70 to the 150 we go 20 fathoms distant. In Paddy-end there is another shaft further west, and another run of lodes.

13,367. Are these distinct mines?—They are now connected by the adit level. I had better call them all one mine and under the same company.

13,368. How is the ore drawn?—By water wheels, machinery, and kibbles, and chains.

13,369. Is no skip used?—No; the shafts are all crooked, or they have been hitherto; but now we are making them perpendicular.

13,370. Are you altering the old shaft?—It is now perpendicular from the surface to the bottom, 200 fathoms.

13,371. Do you intend to put in any other machinery?—Yes; we are preparing to put in skips.

13,372. Shall you work with a cage or a skip?—We are not decided yet about that; it depends a good deal upon the prospects in extending the 150 fathom level, how far the vein will warrant it.

13,373. Do the men work in shifts, and, if so, what length of shift?—8 hours. We have only one set of men in the last shift or core by night; they go on at 6 o'clock and come off at 2; the hours are 2 o'clock and 10.

13,374. Have you tribute or tutwork-men?—We have only one set of tributers.

13,375. Are all the others tutwork-men?—Yes, stoping by the fathom and driving by the fathom.

13,376. Have you had any accidents from blasting?—Yes.

13,377. Is it your practice to use the safety fuze?—Very little, but we have tried it over and over again. I am determined to insist upon it now, because I am confident of the advantages and safety which result from it; the men have had a prejudice against it.

13,378. Do they use now a pricker and a straw?—Yes, they use a copper pricker.

13,379. When the accidents occurred were you able to ascertain from what cause they arose?—Some of the accidents occurred from boring out the holes, most of them, but it is very difficult to get hold of it, for the law is that the men shall have no relief, and there is no doubt that the last man who was killed lost his life in that way; but in about a month after the coroner's inquest it was ascertained that the accident arose from boring out a hole.

13,380. You say that relief is withheld, from what source does that come?—That is the club.

13,381. Is that a club for the purpose of affording relief in sickness, or in case of accidents?—Merely for accidents.

13,382. If a man meets with an accident from his own fault, as I understand you, he does not obtain any relief?—The rule is that he should not obtain any; but he does, notwithstanding that, get what we can do for him.

13,383. Do you keep a separate account of the club money?—Yes, we keep a distinct account.

13,384. What do the men contribute towards the club?—The men contribute 1*s.* per month, and the boys, who are in receipt of 12*s.* per week, contribute 9*d.* per month. Those boys who receive only 10*s.* per week contribute only 6*d.* per month, and other boys, who receive only 5*s.* per week, pay only 4*d.* per month.

13,385. Relief is given only in cases of hurts?—Yes, and pensions are given; we have several pensioners.

13,386. Do you give a pension to a man who has received a hurt and is unable to work?—Yes, about 5*s.* a week; at the present time we give that to two men, and there are two or three women with families, whose husbands lost their lives five or seven years ago, and we continue to give a pension of 3*s.* a week to those women.

13,387. Are the contributions made to the club by the miners sufficient to meet all the demands upon it?—

CONISTON.

Mr. J. Barratt.

2 Oct. 1862.

Yes ; there is a balance at the present time of about 70*l.* in hand.

13,388. Do any of the miners belong to benefit clubs ?—All o them.

13,389. Do you make any difference in the allowance made from your club in such cases ?—Yes ; there is one man who was hurt some years ago and he gets 2*s* 6*d.* a week, but he receives 9*s.* a week out of his club.

13,390. From his own benefit society he receives so much, and in that case the allowance made to him from your club is less than usual?—Yes ; we have only one case of that sort. That is the only case I have known.

13,391. Suppose that a man was receiving an allowance from his own benefit society, should you, generally speaking, make any difference in the allowance you made to him ?—Yes, we should after he could walk about, but not before. We have employed two men to wait upon them, and they did so for a month or six weeks in one case. We provide everything that the doctor recommends ; whatever he recommends we supply. It is entirely left to the doctor, and the doctor is not appointed by the men, but by us. He has a fixed salary, not at all dependent upon the club. We found that the other system did not answer, for the men were constantly holding factions meetings, and we then said, "We will appoint "a doctor, and if he does not give you satisfaction it "will be time then to dispute the matter." But the men had repeatedly chosen them, and there was a general feeling among them that we should soon remove the doctor.

13,392. What remuneration does the doctor now receive ?—He is paid 140*l.* a year, and he attends the families of the miners in sickness ; and he attends the men in accidents and provides medicine.

13,393. Does he attend all the families of the miners for that remuneration ?—Yes.

13,394. (*Mr. Kendall.*) Does he also attend the women in their confinements ?—No ; the usual fee in this country is about 15*s.* for attending women in their confinements ; but we say to him, we will guarantee you half a guinea. Very little of that is paid, but nevertheless we guarantee to him the payment of half a guinea in those cases, which amounts to about 20 guineas a year. We do not get half of the money back again, but we take our chance of collecting it. I should mention that the doctor's salary comes out of this club.

13,395. Does the doctor attend the whole of them in cases of sickness ?—Yes. The half-guinea does not come out of the club. We say we will guarantee it, but fortunately for us there are many men who are pretty well off, and they will pay the doctor 15*s.*

13,396. Then the club money does so far provide for the doctor ?—Yes ; in case of accidents. The doctor will receive out of the office about 160*l.* a year.

13,397. Does he attend other families living in the neighbourhood ?—Yes.

13,398. Have any accidents occurred within the last two or three years from anything but blasting ?—Yes ; a man was killed a year and a half ago in consequence of the ground giving way.

13,399. Is that an accident likely to occur from the nature of the ground ?—No ; it is very seldom that there are any faults, and this was seen.

13,400. Do the miners at all complain in this neighbourhood of shortness of breath ?—Very seldom. The fact is that two thirds of them work above the adit level. They go into the adit level, and we have a mine above the adit level 100 fathoms high, 150 now, and those men that we put there are the old men, who of course complain if they are working in the deep mines. They say, "It is time for me to give over," and then such a man is put there. The bargains are not let by auction as they are in Cornwall. It is all done privately.

13,401. Do you leave that matter to the manager ?—Yes. Once in two months the bargains are let. They are merely drawn out on a piece of paper.

13,402. Do the old miners complain of having to climb the ladders ?—Yes, and they object to go down, but not so with young men.

13,403. What is their reason for not wishing to go down ?—The labour is very great for men to descend as low down as 150 fathoms.

13,404. Is that the only reason that is assigned ?—Yes.

13,405. It is not that the air is close there ?—No, because the air is good.

13,406. What is the greatest heat that is to be found there ?—About 70° or 75° in the bottom. There is no water in the bottom, not a drop. We have to send down water to bore with, and we are 200 fathoms deep.

13,407. Is there not water in some of the levels ?—In the upper levels there is very little ; the engine does not work above an hour a day.

13,408. (*Mr. Austin Bruce.*) Is there some kind of stratification which drains out the water ?—No, it is the closeness of the rock. In the very bottom it is very hot, but as soon as a draught is made the agent says that the air is as good in the 150 as it is elsewhere.

13,409. How can he judge ?—From the coldness of the air. We are obliged to put in doors to stop the current, because it is so strong.

13,410. Do you carry that air into the parts of the level where it is hot ?—Yes, if it is required.

13,411. Is there any place where the candles have not burned well ?—No, except in the level perhaps.

13,412. Have the miners ever to slope the candles ?—No, very rarely ; they may in a level when they have advanced beyond a winze or a sumpt ; when they have advanced 20 or 30 fathoms the air becomes close.

13,413. (*Mr. Holland.*) Is it not so close as to oblige the miners to slope their candles ?—Yes, in that case they would perhaps.

13,414. (*Chairman.*) How far should you say you could drive a level from a winze or a shaft ?—At Tilberthwaite, that is now 500 fathoms from the main level and no communication ; it is going on now with six men.

13,415. (*Mr. Kendall.*) How do you manage to send the air in ?—By a water blast through a 6-inch iron pipe. We drive the air in for a distance of 500 fathoms. I was there not long since, and it would almost blow a candle out.

13,416. What is the height of the waterfall ?—About 30 or 35 feet.

13,417. (*Mr. Holland.*) Does the water fall in a jet ?—Yes ; the water falls into a cistern, and a pipe is carried on horizontally.

13,418. (*Chairman.*) It is carried on for 500 fathoms ?—Yes.

13,419. What is the longest time during which a miner can work in air where the candle will not burn well ?—They do not work above six or seven hours.

13,420. How many weeks or months do you think they could continue to do so ?—We never saw any effects produced by it.

13,421. How long would they continue to drive that level where the air was so bad that a candle would not burn ?—The candle will always burn ; but it is necessary to put it a little on one side. We have no such instance as that now, but I have seen it.

13,422. How long do you think a miner could keep on working in that state of things ?—For six or eight hours.

13,423. Do you think he could continue to work under such circumstances for many weeks or months ?—For months or years. If a man does not like a place he will not take it, and another will come and take it ; there is no compulsion used here.

13,424. You say that the miners sometime refuse to take a place ?—Yes, they say that they do not like it, and they will not take it.

13,425. (*Mr. Holland.*) Do they refuse to take it

because the air is close?—Partly on that account; but there is not an instance of that now. We have not an instance in the mine at the present time where the air is so close as that.

13,426. (*Mr. Austin Bruce.*) To what do you attribute that fact?—To the communications, the winzes and the shafts. We never care about the distance to the shafts, but we put winzes through at certain points, and then a rush of air comes to the winze, and then the level advances on.

13,427. (*Chairman.*) Is there one of these shafts which is always an upcast shaft?—Yes, generally so, in the western part of the mine, for there it is the higher ground.

13,428. (*Mr. Holland.*) Does the air never go down that shaft?—Yes, occasionally it does.

13,429. (*Chairman.*) Is is not at all affected by the weather?—I do not know that it is; we have met with instances in which the current was not so slack, or too strong, and we have put a trap door in, the level of the mountain being 50 or 60 fathoms higher than the downcast shaft.

13,430. You have put trap doors in?—Yes, in many places to check the current, because the men have complained of being cold.

13,431. You put trap doors in to check the current, and not to send the air into any other place?—Yes; there is too much air unfortunately.

13,432. After blasting, how long is it before the powder smoke is cleared away?—It goes away directly, or very soon; but that depends upon whether it is a close air; if it is, then the powder smoke lies longer than at other times.

13,433. (*Mr. Holland.*) What should you say was the longest time that the powder smoke hangs about?—I have no idea; but perhaps 10 minutes or a quarter of an hour.

13,434. Is that considered a long time for the powder smoke to hang about?—I do not know, we do not attend to that, we experience no ill effects from it. If I go underground the men will say to me, You had better wait a quarter of an hour.

13,435. Does it ever hang about so long as an hour?—No.

13,436. Never?—No.

13,437. (*Chairman.*) What deductions are made from the men's earnings besides for the club?—Nothing. There is the house rent of those who live in cottages belonging to us.

13,438. Do the miners pay for candles and for powder?—Yes, and smith's cost.

13,439. For weighing the tools?—Yes, they pay for everything.

13,440. What do you charge the miners for candles?—I think they charge the men 7*s.* a dozen pounds; it is a uniform rule. If we departed from it we should have a constant alteration in the price. We buy the candles for 6*s.* a dozen pounds, perhaps, and we charge the men 7*d.* a pound. It is the same as to the powder; we keep to one rule. If we did not, upon every bargain day we should have to calculate, and say, "the men's cost will be so much less, or so much more."

13,441. Could they not get their own candles elsewhere?—No, they could not supply themselves; they have no credit, and they must come to us for the money.

13,442. In paying wages, is it your practice to keep a month in hand?—It is like a month in these bargains, with respect to the men on contract or tut-work; but they have 9*s.* a week subsist if they wish it. A great number do not wish to have it, and they will wait for their balance; but there is a month in the bargains; in the daywork there is only a week.

13,443. Do the men change their clothes when they go underground?—Not in the mines; they change them all at home.

13,444. How far do the men live from the mines?—In the village about a mile or a mile and a half off; the distance does not exceed that.

13,445. Do the girls who are employed work under cover?—Yes; they are smallish girls.

13,446. And do not the men want any changing house?—No. We tried that many years ago, as far back as 20 years ago. We built a place, but they would not change there; and, finding that, what we have done since that has been this, we have made a convenience of most of the cottages, and we have about 70 or 80 in the village. We put a back kitchen, or a pantry in which there is a fireplace where the men can change and dry their clothes; but they are not made wet in the mines, they are all dry.

13,447. (*Mr. Davey.*) What is the annual produce of your mine?—About 250 tons a month.

13,448. What is the per-centage of the produce?—About 9 per cent. now; it varies from 9 to 10 per cent.; about 9 per cent.

13,449. What sale have you for it here?—We have a private contract with Messrs. , of Liverpool, and they smelt it at St. Helen's. We are under a private contract with them, but we are governed by the Cornwall sales.

13,450. What is the state of the health of your miners generally?—Their health, generally speaking, is very good.

13,451. Is there any difference between the health of the miner and that of the agricultural labourer?—Very little difference I think. The fact is that a great many of our miners have been agricultural labourers who have come into the mines.

13,452. Do they continue in good health after they come to work in the mines?—Yes, I think so. We have men working there from 60 to 80 years of age; but I attribute that in a great measure to putting all the men, as they advance in years, to work in shallow levels. But indeed they come as a matter of course and say that they must have such and such a place. They say "it is my time now, I cannot work down any longer."

13,453. And the work being all set by private contract, you are able to do that?—Yes. The bargains are all let in 10 minutes to 150 men. We merely hand out a slip of paper to the effect that they must come on the Monday morning, and say whether they will take it or not; and if they do, the matter is entered in a book.

13,454. Is there no competition among them?—No; they are free to choose their own partners, and if they have a man that they do not like they can turn him off.

13,455. (*Mr. Kendall.*) Have you any other copper mines in the neighbourhood?—No.

13,456. What is the average amount of the wages of the miners?—For the months of July and August the average wages were about 18*s.* 6*d.* a week. This is exclusive of their contribution to the "Club."

13,457. Have you any other mines of any kind; iron for instance?—I have mines below here in Cumberland.

13,458. Within what distance from this neighbourhood have you any mines?—About 18 miles.

13,459. As far as you are able to say are your wages higher or lower here than in other mines?—We are about the same here as at Furness.

13,460. You intend to employ skips provided your new discoveries warrant the outlay?—Yes.

13,461. What are you lord's royalties?—One-fifteenth.

14,462. Will the lords assist you with respect to the skips?—I do not expect that they will.

13,463. Have you made any application to them?—No.

13,464. As I understand you, your drifts, generally speaking, are about 20 fathoms apart?—Yes.

13,465. Have you any intermediate drifts?—No.

13,466. Do you not find that in a long rise of 20 fathoms you sometimes have bad air?—No. We do not rise; we stope from the end all the way on the whole of the vein; this is on a sort of regular bearing lode. The whole of the ground is cut out, and when

CONISTON.
Mr. J. Barratt.
2 Oct. 1862.

we start in the 20 fathom level we may have a winze before us of 40 fathoms.

13,467. As I understand you, your veins are metal bearing veins almost all the way, and you take it all out?—Yes.

13,468. You stope it away?—Yes; they begin in the roof of the level. A pair of men will take up a stope five fathoms high.

13,469. Is the lode wide enough?—Yes; in some places the lode is narrow.

13,470. What is the average width?—From a foot to 10 and 12 feet; then they must take the country; they must take the rock where it is narrow.

13,471. Have you made any calculations as to the saving of labour to be effected by the use of skips instead of ladder ways?—No. The men have a landing place at every 24 feet, and the ladders are placed at about one in four; and this we find an easy angle to climb.

13,472. Would there not be a great saving of time and expenditure of strength?—I do not think it is worth while for the bottom part of the mine, we care very little about it, we work it only slowly.

13,473. The greater part of your labour is performed above?—Yes, that is going on.

13,474. In the very bottom where there is no water what is the price per fathom for sinking the shaft?—We make a bargain for 20 fathoms to carry the shaft 13 feet long, and six feet six wide.

13,475. What is the amount of the lump bargain?—It will amount to between 400*l.* and 500*l.* Six men will take that bargain, and then again in the stoping we let that sometimes for a bargain, and that will last four men 12 months. We say to them, "We will give you so much for cutting out the ground."

13,476. You deal with them in a large way?—Yes.

13,477. And you find that to answer?—Yes; there was a partnership in an eight months' bargain of four men, and they made 2*l.* a week by six months work.

13,478. Do you allow those men to increase the number of men working under them if they like?—We do not care.

13,479. Then they are contractors under you?—Yes.

13,480. Do they employ whom they like?—Yes. Indeed, we rather encourage it, as they will bring in strong country lads. It is all boring, but there must be one in the gang who has judgment. They will hire these young men for 14*s.* or 15*s.* a week, and they will bore as much as the best men in the mines. Then it comes to this, that in, perhaps, six months, those young fellows will say, "I will now "work for myself. I can cut the rock as well as "you can."

13,481. On the average how much per fathom do you give them?—It varies from 4*l.* to 10*l.* a fathom in levels.

13,482. (*Mr. Holland.*) About what age are these country lads to whom you have just referred?—They are about 15 or 16 years of age.

13,483. At what age do you consider that a miner becomes old?—I do not know. Perhaps 60 or 70.

13,484. Should you consider a miner old at 50?—No. They are able men at that age.

13,485. You do not think that they begin to break up at the age of 50?—No.

13,486. Are you acquainted with the Cornish miners?—Yes.

13,487. Are your miners very decidedly healthier than the Cornish miners are?—Yes; and they are stronger men.

13,488. Have you ever observed the complaint which is called miners' consumption in Cornwall?—Yes.

13,489. Have you anything of that kind here?—No. Very rarely. In fact it is not known.

13,490. It is not remarkable amongst the miners in this neighbourhood?—No.

13,491. When a miner desires to be employed in the upper levels, is that to avoid the climbing?—Yes; they say that it is easier work. We put the young men down into the bottom.

13,492. Are these mines in your opinion quite free from dust?—Yes.

13,493. Are they very free from powder smoke?—Yes, very much so, although our consumption of powder is considerable.

15,494. Are your mines cooler than the Cornwall mines?—Yes, they are cooler; for example, we have to put in trap-doors to diminish the draught.

15,495. Is that to increase the comfort of the men or for the purpose of saving candles?—It is done for both purposes.

13,496. For which purpose chiefly is it done?—I should say for both.

13,497. (*Mr. Austin Bruce.*) At what age do your men begin to work underground?—They will begin perhaps at the age of 15; but there are instances here where a man has three sons, and he will then take a bargain for four men and bring his three sons in with him who are boys.

13,498. At what age generally do they go underground to work?—They put them underground at the age of 15; we object to it, because we require those boys for the surface.

13,499. Have you none working underground under the age of 15?—No, I should think not.

13,500. Have you many between the ages of 15 and 20 working underground?—Not a great many.

13,501. Do you think that those who begin to work at the age of 15 underground last as long as men who come in at a later age?—I do not know that we have paid any attention to that.

13,502. You have stated that your upcast shaft is always the same?—I think it is generally so.

13,503. Does not that depend entirely upon its being higher than the downcast?—I presume so.

13,504. Supposing that it were not so, and that you had not that natural advantage, should you take any trouble so to guide the air as to make the up-cast shaft always up-cast?—I do not know; we have never had an instance to require it, and I do not see how it could be done, except by stopping up the upper parts of the mine to the west of the high ground. The natural cast is up-cast.

13,505. You have so much ventilation that you have no difficulty in supplying every portion of your mines?—That is so.

13,506. Are the miners a contented set of men?—Yes, they are.

13,507. Have you ever known any strikes to take place amongst them?—I have never known an instance.

13,508. There are no complaints at all which you consider peculiar to the miners working in your copper mines?—No.

13,509. (*Mr. Holland.*) Have you ever noticed the temperature of the air in the up-cast shaft?—No; but it would be cold.

13,510. (*Chairman.*) At the bottom of the ladders is it sollered over at each stage?—Yes; and then the next goes behind that. There are bunnings, which means a platform or stage.

13,511. Is that a very necessary precaution in order to prevent accidents?—Yes. We never had but one instance of a man falling, and that occurred some five or six years ago; he slipped down the ladder and there he stopped.

13,512. Have you stated the lowest wages that any man earns?—No. There may be a stranger who may not earn more than 12*s.* or 14*s.* per week for a month or two.

13,513. What are the highest wages that a man may earn?—They have made as much as 30*s.* or 40*s.* a week, but we do not take them into the averages; they are exceptions. If we let a bargain for 500*l.* we do not consider that a fair case for an average.

13,514. (*Mr. Holland.*) What wages do the country labourers receive?—Half a crown or 3*s.* a day.

The witness withdrew.

Mr. WILLIAM MITCHELL examined.

13,515. (*Chairman.*) Do you manage both the mines referred to by the last witness ?—I manage only one of them ; we have two departments ; a nephew of Mr. Barratt's manages one part, and I manage the other. I take the low mine, or the deep mine.

13,516. How long have you been in your present position ?—I have been there for 12 years under this company.

13,517. Are you a Cornish man ?—Yes.

13,518. Have you worked in any mines in Cornwall ?—Yes. I was brought up from a boy as a miner.

13,519. Did you ever work in any mines in Cornwall in any poor air ?—Yes. I have worked in poor air in mines, but not much.

13,520. Did you suffer at all from working in poor air ?—Yes. I suffered from head ache, and weariness or languidness after it.

13,521. How did you discover that you were working in poor air ?—By the difficulty I felt in breathing. I felt a difficulty, and also from the candles not burning (or burning dimly).

14,522. Have you ever seen any place in the mine in which you are engaged where the candles would not burn ?—No.

13,523. Are there any doors in this mine ?—Yes, we use what we call trap-doors.

13,524. Could not they be used in Cornish mines with advantage ?—Yes ; they might be used more than they are from what I have seen of mining generally.

13,525. You think that the trap-doors could be advantageously used for the purpose of dissecting currents of air ?—Yes ; and much better than at present. Oftentimes in mines where there is water that water might be used for throwing the air into the levels when they are exploring the mines.

13,526. Have you ever used a water-blast ?—Yes ; we use a water-blast in these mines, and we throw in the air now for 500 fathoms.

13,527. That is in the mine called Tilberthwaite, is it not ?—Yes.

13,528. Not in the Coniston mine ?—No, we have no occasion there.

13,529. Is there no place in your deep mine where there is bad air ?—No.

13,530. Do the miners receive a certain allowance of candles per week ?—Every man receives 2 lbs. a week.

13,531. What do the miners pay for the candles ?—They pay 7*d.* a pound ; that is the mine charge.

13,532. Do they consume the whole of the 2 lbs. of candles so supplied to them per week ?—We do not know that ; they are allowed to take them if they do not use them.

13,533. Do the men ever complain of having to climb up the ladders ?—Yes, they complain of that ; it is very fatiguing and exhausting after doing a hard day's work.

13,534. Do you think that that prevents any of the older men from going down ?—Yes ; when the miners get old and infirm they are not capable of doing it.

13,535. I suppose you would rather have experienced men to work in the mine than inexperienced men ?—Yes, decidedly ; there is nothing like a man being trained up from boyhood into it as a miner, for they require experience.

13,536. Then the circumstance of having to climb the ladders may prevent experienced miners from being employed in the mine ?—No.

13,537. Have you ever been yourself in a skip or a cage ?—Never in a skip. I have been down by what they call the man-engine in Cornwall.

13,538. Have you never been in a colliery ?—Never. I have been brought up a lead, tin, and copper miner.

13,539. (*Mr. Holland.*) Have you ever seen any iron mines ?—Yes ; I have been down them, but I have only been in Mr. Barratt's mine.

13,540. (*Chairman.*) Do the men ever go down in a cage ?—They do occasionally, but they have a ladder put into the road, and they can go either way ; I went the ladder way, not being accustomed to ride in the cage.

13,541. (*Mr. Davey.*) Do you belong to that department in which they are driving a long cross cut in this mine ?—Yes, I go there occasionally for the purpose of measuring and letting the work.

13,542. What is the object of driving that cross cut ?—To cut copper veins and to open up a new mine.

13,543. Is that done upon speculation ?—There has been a mine wrought that has been worked and sunk down for 25 fathoms, and this level is coming in 87½ fathoms deep from surface, and 25 fathoms below the old working, and it is in order to save the expense of lifting and bringing it out of the tramway and to open up a new mine.

13,544. You will bring it out, as I understand you, to your dressing floors ?—Yes, we shall put in a horse.

13,545. You have stated that you had found some foul air in a mine in Cornwall ?—Yes.

13,546. You also stated that there are many places in which they might improve the state of the air by waterfalls ?—Yes, by water blasts and trap-doors.

13,547. Can you give me any instance of a mine in which you found that state of things to exist ?—At Par Consols and Fowey Consols, where I was brought up, and at South Caradon. I have worked in that as a tributer.

13,548. Do you know whether those matters had been represented to the agent ?—I do not know whether they had been altogether, but it is connected with a little expense ; if it was enforced it might ultimately be beneficial to the men, and I believe also ultimately to the employers.

13,549. Are you expressing merely your own opinion or the opinion of the agent ?—It is just my own simple opinion, judging from experience.

13,550. Have you been down the mines by ladders ?—Yes, and also by the man-engine.

13,551. Have you had sufficient experience to feel justified in recommending anything of that kind to your adventurers ?—It is a very expensive affair, and we know that it is very beneficial, but still it takes a good deal of money to carry a thing of that sort out and it is not every company that can find the means to provide a man-engine.

13,552. Have you any idea what the saving would be to the men ?—It would be a great saving to the men, and I should think to the masters. I think that the miners could do one-fifth more work as compared with climbing the ladders in these very deep mines, if one came to work it out.

13,553. But the principal part of your men do not go to the bottom of the mine and of course they do not suffer from climbing ?—No, they do not ; it is only some part of them that go to the bottom ; some men can walk in and out without climbing.

13,554. Are the younger men employed in the deeper part of the mines ?—Yes, we generally select them for going to the deep works.

13,555. (*Mr. Kendall.*) Have you ever seen a case of close air in any mine which might not be remedied by a small outlay and a little skill ?—No ; in every case that I have seen it might have been remedied.

13,556. It is a mere matter of expense, is it not ?—Yes.

13,557. (*Mr. Austin Bruce.*) You have just answered a question with reference to close ends, do you believe that the air is so well distributed over the mines in Cornwall to which you have referred as it is over these mines at Coniston ?—I think not.

CONISTON.

Mr. W. Mitchell.

2 Oct. 1862.

13,558. You think it is not so well distributed generally throughout the works ?—The mines in Cornwall are not so well ventilated as our mines are.

13,559. In what do you think the superiority of these mines with regard to ventilation consists ?—It is by using trap-doors and pipes more than they do in Cornwall.

13,560. By trap-doors do you mean for distributing the air, or pipes to bring in fresh air ?—Yes.

13,561. Are the trap-doors used for checking the air, or for distributing it ?—They are used to divert the air from one channel into another where it is wanted.

13,562. So that every portion of the mine gets its proper supply of air ?—Yes.

13,563. Do you take any precautions against the leakage of the air before it gets down into the deeper parts of the mine ?—We have got a natural downcast and an upcast in the deep mine ; we have a shaft at each extremity one is downcast and the other upcast ; and then, whenever the air is wanted to be directed to any place, we use these trap-doors in order to direct the air to those places where it is most wanted.

13,564. Could you do that as effectively if you had not a natural upcast and a natural downcast ?—No.

135.65. Supposing you had not a natural upcast and downcast, should you consider it worth while to make them by artificial means ?—Yes.

13,566. Do you think that the ventilation can be complete without an upcast and a downcast ?—No.

13,567. At what age do the boys come into these mines to work ?—We do not take any boys younger than about 14.

13,568. Are there many boys employed between the ages of 14 and 18 ?—We have a few but not many ; perhaps half a score, or perhaps there are 12, working in the mines or in the underground department.

13,569. As a rule, are there fewer boys working in the Coniston mine than there would be in a mine of equal importance in Cornwall ?—Yes.

13,570. To what do you attribute the fact that fewer boys are employed here than in Cornwall ?—It is owing to the system of working ; we have a single-hand system here ; one man holds the jumper or the borer with one hand, and he strikes it also with the other in boring rock. In Cornwall the system is double hand work ; one man strikes, and boys generally are used to turn those holes for drilling.

13,571. Which system do you think answers the best ?—I think that the single hand system is the better system of the two.

13,572. Would not the double hand system drive the borer in more rapidly ?—Yes, it would ; but not in proportion to one single handed.

13,573. You mean not in proportion to the quantity of labour employed ?—Yes.

13,574. What is the weight of the hammer that they use ?—It weighs from 4 lbs. to 5 lbs.

13,575. What is the weight of the hammer ordinarily used in Cornwall ?—It is about 6 lbs. or 7 lbs. ; the average, I think, is 7 lbs. ; sometimes it is 8 lbs. or 9 lbs.

13,576. Do you think that it is any advantage to the workmen to come to work underground at a later period of life ?—Yes, I think that they generally live longer lives.

13,577. What was your age when you left the mines in Cornwall ?—I was 30 years of age.

13,578. Have you yourself sustained any permanent injury from working in bad air ?—Not that I know of.

13,579. Have you ever had any cough ?—No.

13,580. Taking the workmen of 50 years of age throughout the works, do you find that they are more or less capable of working at that age at Coniston than men of the same age were in Cornwall ?—Yes. I think that a man of 50 here, speaking generally of our miners, as far as I have had experience of them, is equal to a man of 45 among the Cornish miners.

13,581. Have you known any cases of men suffering from any complaints arising from working in the mines in this neighbourhood ?—No, not that I recollect.

13,582. Are coughs common among the miners ?—We certainly do not consider that a man enjoys such good health as a miner, that is not at the same age, as an agricultural labourer does, or a working man at the surface.

13,583. You mean in this district ?—Yes ; we do not consider mining to be so healthy.

13,584. Have you had any opportunity of seeing the miners who are employed in the iron mines ?—Yes.

13,585. Do you consider that, in any respect, there is any difference between the iron miners and the copper miners ?—I think that the iron miners are made up of nearly all classes of men. They are not what you would call thorough-bred miners, or men who have been brought up to it as a trade. The iron miners are made up of agricultural labourers, seamen, and shoemakers, and men of all kinds ; and that kind of work does not require the same skill as in copper mines.

13,586. And therefore they come in later in life ?—Yes ; they come in at all ages. A labourer can come in who has not served for any time, and he can be made an iron miner in a week ; but he could not be made a copper or a lead miner.

13,587. (*Mr. Kendall.*) Have you not an advantage over the Cornish mines in your copper mines here by having such great backs to your adits ?—Yes.

13,588. And that conduces more to the health of the men ?—Yes.

13,589. Is your up-cast shaft always an up-cast shaft ?—No, not always ; which is owing partly to the state of the atmosphere, whether it be light or heavy above ; sometimes it is one and sometimes the other. It does not vary in the summer, but it may vary in gusty weather and in strong winds.

13,590. Generally speaking you have a regular up-cast shaft, but there are seasons when it changes ?—Yes ; and is just the reverse.

13,591. Is your up-cast shaft an old one or a modern one ?—The up-cast shaft is what they call a new shaft.

13,592. Have you any communications by workings immediately into that shaft at the different levels ?—Yes.

13,593. Is not that merely as a chimney ?—It is a level driven from one shaft to the other shaft.

13,594. At what depth is that level ?—At the 130 fathoms.

13,595. From that 130 fathoms to the adit level have you any other communication with that shaft ?—Yes, there are levels at every 20 fathoms.

13,596. Do they run into that shaft ?—Yes ; yet still it is an up-cast shaft. We have doors to the shaft. The shaft is wooded at the openings of the levels. We use doors that we close.

13,597. (*Mr. Kendall.*) You do not beat down all the lode close home to the shaft ?—No.

13,598. (*Mr. Holland.*) Have you workings beyond the shaft both ways ?—Yes.

13,599. Is there much ore between the two ?—The greater part is between the two.

13,600. You stated that you were satisfied that if the men were lifted up and down there would be a great saving of expense both to themselves and to their employers ?—Yes.

13,601. Have you observed that the men in the high levels can do more work than those who are employed in the lower levels ?—Yes, they can do one-fifth more.

13,602. Have you ascertained that as a fact ?—Yes.

13,603. Is that because they are saved the trouble and fatigue of climbing ?—Yes.

13,604. (*Mr. Austin Bruce.*) Is not the temperature greater down below ?—Yes.

13,605. Has not that something to do with the

difference of the amount of work performed?—Yes; it will cause more fatigue.

13,606. (*Mr. Holland.*) Have you any workings where the temperature is such as to impede the working of the men?—The highest I think is not more than 75° or 80°.

13,607. The men cannot work so much in 75° or 80° as they can in 50° or 60°?—That is true.

13,608. You have seen men working in very hot levels in Cornwall?—Yes.

13,609. Can the men employed in the mines here do unquestionably more work than in those hot levels?—Yes.

13,610. Can you give any estimate of the difference?—I should think about one half.

13,611. Do you mean to say that your miners here can do twice as much as the others?—Yes, twice as much as in those very deep hot levels.

13,612. Would it not be worth while to expend a good deal of money in order to cool those levels?—That depends certainly upon the state of the mines, and what the prospects of the mines are.

13,613. It would be worth while, would it not, to expend a considerable sum per annum for that purpose while the mines are being worked?—Yes, if you have a good mine.

The witness withdrew.

Adjourned till To-morrow at Derwentwater.

DERWENTWATER.

Friday, 3rd October 1862.

PRESENT:

The Right Honourable Lord KINNAIRD, K.T.	H. AUSTIN BRUCE, Esq., M.P.
NICHOLAS KENDALL, Esq., M.P.	RICHARD DAVEY, Esq., M.P.
JOHN ST. AUBYN, Esq. M.P.	P. H. HOLLAND, Esq.

The Right Honourable Lord KINNAIRD, K.T., in the Chair.

Mr. BENJAMIN PLUMMER examined.

13,614. (*Chairman.*) What is the name of the mine or mines of which you have the charge?—Goldscope is the first, then Yewthwaite, and Castlenook.

13,615. Are they all copper mines?—No, lead mines. Goldscope formerly was a copper mine, but recently nothing but lead has been found; it is on a distinct lode from what the copper was found in.

13,616. How many men altogether are employed in the mines?—On the surface and underground there are 80 men and boys.

13,617. How many of those are employed underground?—Forty-two men are employed underground at Goldscope, nine at Castlenook, and four at Yewthwaite.

13,618. How do the men work, by shifts?—Generally by bargains.

13,619. For how many hours do the men work?—Eight hours.

13,620. Are there any night shifts?—Yes, but we avoid them as much as possible; we merely keep two men by night to look after the machinery; it is principally in the forenoons and afternoons; there are three shifts when we work by night, there are two shifts principally.

13,621. Is there much water in the mines?—Not a great deal.

13,622. How do the men ascend and descend into the mines?—By ladders.

13,623. What is the greatest distance from the surface that they are working at Goldscope?—Seventy-two fathoms below the adit, and 90 fathoms from the surface.

13,624. How do you draw?—With a water-wheel.

13,625. Do you use a skip?—Kibbles.

13,626. Is the work let by the ton or by the fathom?—By the fathom.

13,627. What are the men's earnings?—The average earnings will be from 15*s.* to 17*s.* a week; about 16*s.* are what they are generally allowed.

13,628. What are the highest wages that a man may earn?—I have known them for a single month make as much as 30*s.* or 35*s.* a week, but that is not often the case.

13,629. How often are the miners paid?—They are paid once a month.

13,630. Is there a month's wages kept in hand?—Yes, it is so, or rather three weeks are kept in hand; we let the bargains on the last Saturday, and pay the third Saturday following.

13,631. Are the bargains let by competition or are they let for fixed prices?—They are fixed prices; it is not a public survey the same as in Cornwall or Devonshire, it is so small, as we measure up the last month's work; we let the work for the coming month as we go on, and if the men do not think the price will answer, they refuse it.

13,632. Is there no tribute work in your mines?—No.

13,633. What deductions are made from the men?—For candles, smith's cost, steel, iron, shovels, powder cans, and powder.

13,634. What do they pay now for candles?—They pay 9*d.* a pound at this present time.

13,635. How much do they pay for powder?—8*d.* a pound.

13,636. Do they also pay for the doctor?—No.

13,637. Have you no doctor attached to your mines?—No.

13,638. Have you a sick club?—Yes.

13,639. Is assistance afforded in case of visible accidents or sickness?—For both.

13,640. What do the men contribute to the club?—1*s.* a month.

13,641. What is allowed to them when they are sick?—They are allowed 8*s.* per week for three months.

13,642. Do they then provide their own doctor and medicines?—Yes. There is a reason why we do not insist upon their paying to the doctor; the men here are principally connected with the Odd Fellows' Club which is a universal club throughout the country, and in that club they have a doctor provided, consequently the majority of the men belonging to our mine who join a sick club object to pay the doctor twice, and consequently we have none.

13,643. Do they receive an allowance from your club in addition to what they receive from the Odd Fellows' club?—Yes.

13,644. Is a separate account kept of your club fund?—Yes. The funds belong entirely to the miners. They are looked after by three miners, who are chosen once in six months. I act as secretary, and keep the accounts, and the balance I hand over to the Cumberland Union bank in the name of the acting committee.

13,645. The fund, as I understand you, is managed entirely by the men ?—Yes.

13,646. Are the payments received from the men sufficient to provide the allowances that are made in cases of sickness ?—Yes ; and a balance has accumulated since we started the club.

13,647. The club, I believe, consists of about 70 men and boys ?—Yes.

13,648. Do the boys make a smaller contribution than the men ?—Yes ; that is regulated according to the pay which they receive. A boy pays 9*d.* a month, if he gets 6*s.* a week, and the one who pays 6*d.* a month gets only 4*s.* Then in case of an accident a man receives pay as long as he is ill, provided the funds are not diminished below 5*l.* If they are, then we call the members together, and provide for it.

13,649. Is that done by extra subscriptions ?—Yes ; by every man subscribing something extra ; but that has not occurred yet. We have found that we have had plenty of money for all our purposes, so far.

13,650. Do nearly all the men reside at a distance from the mines ?—Yes. There are a few, perhaps eight or ten, in the village ; but generally they do.

13,651. What distance have they to come ?—From Keswick, five miles, and others three miles and a half ; but there is a lodging house for them.

13,652. What day of the week do they come to work ?—On Monday mornings. They work till Wednesday dinner time ; then they go home, and remain at home for 16 hours. They come back the next day, and work the afternoon shift, and follow on to the end of the week.

13,653. How many men are accommodated in the lodging house ?—About 25, I should think ; but they are never all there at the same time scarcely.

13,654. How many men can sleep there ?—I think about 15 or 16.

13,655. Will you be good enough to describe the size of the lodging house and the nature of it ?—It is on the second floor ; below we have store houses and lead houses. I think it is about 20 feet long by 15 or 16 feet wide. It is slated, it is plastered against the slate inside, to keep out the cold. I think that the extreme height up to the rigging will be 12 or 14 feet, but the sides of it would be five feet six or six feet only.

13,656. Do the men sleep in places like cabins, or one man over another ?—No. The beds have plenty of room. They are all on the same floor on rough bedsteads.

13,657. (*Mr. Kendall.*) In short it is one large dormitory ?—Yes.

13,658. (*Mr. Austin Bruce.*) Where the men sleep four nights a week ?—Yes.

13,659. (*Chairman.*) Do they pay for this accommodation ?—No. The men are provided with the room and firing from the mine.

13,660. (*Mr. Austin Bruce.*) Are they supplied with bed clothes ?—No ; they provide their own.

13,661. (*Chairman.*) Do they cook for themselves ?—They generally bring their food cooked, and warm it at the lodging house. If they have potatoes, of course they dress them there. They have a boiler on the premises, and frying pans, and the necessary utensils if they choose to dress their own food.

13,662. (*Mr. Kendall.*) Is there no matron there ?—No ; the men do for themselves.

13,663. They take care of themselves, and make their own beds ?—Yes ; they have been accustomed to it from boys, and they take to it quite naturally, as their wives do at home.

13,664. What is the greatest length of any drifts in your mines ?—The greatest length of any drifts that we have from day will be 450 fathoms. The first level was driven 200 fathoms before the lead was cut, and at that point we sunk a shaft, and that shaft communicates with the surface. We have driven south of that shaft 250 fathoms ; consequently the level from there would be 450 fathoms long. We have only one shaft, but we have small winzes to effect ventilation, and for the miners to go up and down.

13,665. What means of ventilation have you employed ?—We have used the ventilating fan with zinc pipes 4 inches in diameter.

13,666. How is that ventilating fan worked ?—It is worked by a small water-wheel, and the speed is multiplied very much to force the air in.

13,667. In what part of the mine is that applied ?—We take the air from the shaft, and force it up through those pipes from the shaft that is carried out to day. We take it from that point, and it is perfectly pure there.

13,668. Does the water that works this wheel fall down the shaft ?—It is brought down in boxes through the shaft, and then brought out through the first level that I have described.

13,669. At the bottom of the shaft it drives a wheel ?—Yes, a very small water-wheel, and that water-wheel carries a fan blast.

13,670. Does the shaft go down below the day level ?—Yes, 72 fathoms ; the wheel that works the fan is fixed in the adit level.

13,671. Is the fan constantly at work ?—Yes.

13,672. And do you find that perfect ventilation is effected by that means ?—Sometimes, when the atmosphere is not very clear we find that the air is bad after that even, but there are times when we get a brisk wind outside, and a clear atmosphere, that we get very good air ; for instance to day, when there is no wind, and the weather foggy, the smoke would lie and be very black in the fore-end.

13,673. Would the candles burn well ?—Yes ; it is only the smoke, you find a choking sensation, and it is very disagreeable to breathe.

13,674. By what means does the foul air escape ?—It is driven back through that level, a pipe is conveying up the pure air, and that being heavier than the impure, it is driving it away.

13,675. Does not the impure air find its way up the shaft at all, the return air and the smoke ?—Yes.

13,676. Is there not a danger of its being blown back again at the point where you have a fan ?—No, I do not think there is.

13,677. (*Mr. Holland.*) What prevents the fan from driving in the return air ?—Where the fan is fixed the air is as good as it is here, nearly, under ordinary circumstances, when the atmosphere is clear, and it is nice weather ; but if there is a little impure air mixing with it, it is not felt. There is generally a strong current where the fan is working.

13,678. (*Chairman.*) On such a day as this, how long are the men obliged to refrain from working after they have blasted a hole ?—From 10 minutes to a quarter of an hour.

13,679. Are they ever obliged to cease work altogether ?—No.

13,680. Will the candles always burn well ?—Yes.

13,681. Where do the men go during the 10 minutes or a quarter of an hour after they have blasted a hole ?—They go back into the level before the smoke gets back to them ; they go back to a point where it is dry and sit down, and perhaps get their meat, or smoke their pipes, till the smoke is driven out of the fore-end ; and when it reaches them it has left their working place.

13,682. (*Mr. Kendall.*) Then they are obliged to pass through that smoke before they can get into pure air again ?—Yes, they must breathe it as they pass through it.

13,683. (*Chairman.*) Have you some men who suffer in their breathing ?—Yes, we have a few old men who do.

13,684. Have they been so affected since they have been with you, or were they so before they came to you ?—Before they came they were ill, they suffered from chest disease before they came there ; they came from Alston Moor. Nearly all the miners that I have seen, who have come from Alston Moor,

above 40 years of age, have been affected in their breathing, in fact we have had men who have died, and one of them was not more than 45.

13,685. (*Mr. Holland.*) Of what disease did those men die?—The cause of their death was asthmatical complaint, or short breathing, miners' asthma or decline.

13,686. (*Chairman.*) How do the men working with you who are so affected go down into the mines?—I have always so far provided shallow places for the old men to work in, and those men who are most affected now are working at one of those little mines called Castle Nook, which is only 10 fathoms below the adit level; they go up and down by ladders to that place.

13,687. Do the miners change their clothes when they go underground?—Yes.

13,688. And when they come up again?—Yes, generally; but sometimes they are very indolent, and they do not. When they are going to stop in the lodge they will keep on the flannel that they have been working in; if they are going home they put on a clean shirt and clean clothes.

13,689. Where do they change their clothes?—Generally in a part of the lodging where a fire is kept.

13,690. Have any accidents ever occurred from falling off the ladders?—Never. We have had one accident which occurred from the premature explosion of a hole.

13,691. Were you able to ascertain how that explosion took place?—Yes, we could account for it as near as it possibly could be accounted for; the man had blasted the hole before, and at the first blasting the hole that he put the powder into was perfectly sound; he blasted it and it proved to be too strong, or he did not give it powder enough to throw the burthen in, but it made a rent in the rock, and he put powder in again, and probably did not use sufficient care to clear the powder away on the sides, and in using the stemming bar the powder in the crack became ignited acting as a train to the main charge, he was injured in his arm and very much burned about his face; a lot of stones was thrown into his face, and he was sick for three or four months from it; fortunately his eyes were not injured.

13,692. That accident was caused by an iron stemming rod?—Yes.

13,693. Do you always use an iron stemming rod here?—Yes.

13,694. (*Mr. Holland.*) Do you never use bronze rods?—No.

13,695. (*Chairman.*) Do you use the patent safety fuze?—In some cases we do; where we have wet ground we do, in dry ground the miners prefer a straw.

13,696. Is there any reason why they should prefer a straw?—They have been accustomed to it all their lives, and they say that it makes less smoke than the safety fuze, and is not more dangerous; we have been very fortunate since I have known the mine.

13,697. What is your own opinion with regard to the preference to be given to the safety fuze?—I should prefer using the safety fuze, because I was accustomed to it.

13,698. (*Mr. Davey.*) What is the size of your lead lode generally?—It varies very considerably; in some places it is thirty feet, and in some not more than four.

13,699. Is it of the same continuous richness throughout?—No. There are ribs of what we call veinstone, ribs of stone and ribs of quartz, and greenstone or trap, all mixed up in one large vein.

13,700. Do you excavate all the ground, or do you leave parts of it?—We leave in some places pillars or horses between, that is, large ribs of veinstone and quartz spar, standing where we see it is safe, and we let them remain, and go in between and take out the metal.

13,701. What is your monthly produce?—About 33 or 34 tons.

13,702. Is the mine rich in silver?—No.

13,703. You stated just now that you used zinc pipes; do you find them last as long as pipes made of any other metal?—Yes; they answer much better than tin, which would not do, because the water would deteriorate it.

13,704. Are the zinc pipes cheaper than iron?—Yes.

13,705. What do you pay for them?—We pay 1*s.* 4*d.* per yard for four-inch zinc pipes; No. 10 zinc.

13,706. Has the water no effect upon those pipes?—It has not. I do not know what it would be in a copper mine.

13,707. Do they last much longer than wooden pipes?—Yes; and the friction is not half so great as in wood. A four-inch zinc pipe would convey more air in my opinion than a six-inch wooden pipe.

13,708. Do you lose much air?—There is no necessity to lose very much if the joints are properly made.

13,709. After driving your cross cut from the copper lode to cut the lead, how do you proceed; how deep have you gone under the day level?—Seventy-two fathoms.

13,710. Do you bring up from there all the lead, and go through that long cross cut again to the shaft?—We bring it up the shaft from the 72 fathoms, and then waggon it out with a pony through the level to day.

13,711. Would it not be cheaper to sink another shaft over that?—No.

13,712. What stone have you to carry the shaft through?—It is principally slate.

13,713. Is it very hard?—In some places it is hard. Probably it would cost 12*l.* a fathom to sink a shaft, and we are availing ourselves of putting in a deeper level.

13,714. (*Mr. Austin Bruce.*) At what age do your miners begin to work underground?—About the age of 18.

13,715. Have you any boys employed upon any work underground?—We have but one.

13,716. Do they work single or double-handed?—In some cases they work single-handed and in some cases double.

13,717. Up to what age do miners usually continue to work?—We have men working at the mine now from 50 to 60 years of age I should think. I have only known 2 or 3 to die since I have been here, and they came from Alston Moor.

13,718. Do you observe any difference between the men who have been born and have always resided in this district, and the men who come from Alston Moor?—Yes, there is a very marked difference.

13,719. What is the difference that you have observed?—The difference is in the colour of the face, that is one thing that you will find; the Alston Moor men are principally of a sallow complexion, and suffer from short breathing, you see that in fact from their breathing when they are talking to you.

13,720. Are the men of this district who have not left it but who have worked from 18 years of age in these lead mines as healthy as the agricultural population?—No, I do not think they are.

13,721. Do any of your own men who have not come from a distance suffer from miner's asthma?—I do not know of any.

13,722. What do they suffer from?—They principally suffer I think from rheumatism and lumbago in the back, that is what they principally remain at home sick for, that is the doctor's certificate generally.

13,723. Have the men to work on their sides at all?—No; they are all standing up or sitting down.

13,724. What is the size of the drift in which they work?—Our general rule is to carry the levels seven feet high by four feet wide.

13,725. That is the usual space in which they work?—No; that is, the drifts are that size when

DERWENT-WATER.

Mr. B. Plummer.

3 Oct. 1862.

we take away the ore. It is sometimes much smaller, and at other times much larger, all depends on the nature and size of the lode.

13,726. What would be the height of the place in which they work under those circumstances ?—The height in some cases will be perhaps 12 or 15 feet; they are obliged to put in stages to get up, the breadth being from two to three and four feet, depending upon the width of the ore and the lode.

13,727. Do you carry air up into all these places ?—No ; at Goldscope the mine is naturally ventilated; first we sink an engine shaft 10 fathoms say from the 60-fathom level to the 70 fathoms, and at the time we are doing that we have two companies of men, each of them at 10 or 12 fathoms, or at the most feasible point from the shaft, sinking winzes, and when they are down to the 70-fathom level and the shaft is down to the 70-fathom level, we drive from the shaft out and effect a communication with the bottom of those winzes.

13,728. You have stated that the main difference in the supply of air below arose from the dulness of the atmosphere above ?—Yes.

13,729. Is there any cause besides the dulness of the atmosphere and the powder smoke which effects the air below ?—I do not know of any; I do not see how there can be; to-day it is a dull day, and we should find the air or the smoke lie heavy and black and worse to breathe; when we find that the atmosphere is dull outside we attribute to it all foulness ; if to-morrow we find that the air is poor inside we say that the atmosphere is the cause of it.

13,730. Are you aware whether there are any gases or vapours proceeding from the mine which affect the air ?—I should think not, not in the strata that we are passing through.

13,731. Do the children of the miners all go to school ?—I do not know, they live so far away from the mines.

13,732. Do you find that the men are able to read and write in general ?—I should think that about one half of them can write ; I have had some experience of that in trying to get them to sign their names about one half of them sign with a cross.

13,733. What should you say as to their being able to read ?—Many of them can read, particularly the younger ones, for they are better scholars than their fathers.

13,734. Do you find that they do read in the evenings ?—Yes ; a great many of them read.

13,735. Do some of them read out to the others ?—I really dont know, but I think not; I am sure however of this, that they cannot read with any pleasure, the boys are fonder of play, consequently they would drown the reading of the others, and after the work of the day the boys have no taste for reading.

13,736. (*Mr. Kendall.*) When you say that you think they read a good deal, do you mean that they read in the dormitory that you have spoken of ?—Yes, some of the young men.

13,737. Is there any beershop near to it ?—The nearest is a mile and a half away.

13,738. Do the men go much to that beer shop ?—Sometimes ; not much ; indeed I may say very little, for they are very generally temperate.

13,739. Did you come to this district as an agent or to work as a miner ?—I came here as an agent, I have been here for six years ; I was an agent in North Wales before.

13,740. Did you ever work in Cornwall ?—Yes, at Holmbush near Callington, and at Devon Consols.

13,741. Do you know any Cornish miners who are working in this neighbourhood ?—Yes, one.

13,742. There are not many ?—No.

13,743. When you were at Devon Consols you saw Cornish miners there, I suppose ?—Yes.

13,744. Have you remarked any difference between the Cornish miners whom you saw there and the miners from Alston Moor whom you see here ?—I can hardly tell ; when I was at Devon Great Consols the Cornish miners who came there were principally young men ; I am speaking now of 14 years ago ; they were very strong young men.

13,745. Referring now to Devon men of all ages, do you perceive any difference between the Devon miners and the Alston Moor miners of the same age ?—Yes.

13,746. To which would you give the preference ?—I should give the preference to the Devon men at the same age ; 50 is a great age for an Alston Moor miner, from what I have heard.

13,747. What are the wages of an agricultural labourer in this district ?—I think that the wages of an agricultural labourer in the summer season will be about 18*s.*

13,748. Will the average do you think be more or less than that ?—I fancy from what I have heard that they will not average more than 12*s.* or 13*s.* throughout the year.

13,749. Are you able to express an opinion as to the diet of the agricultural labourers and the food that is consumed by the miners, or which of them lives the best ?—I have no opportunity of judging about that.

13,750. (*Mr. Holland.*) You spoke just now of the wages being from 15*s.* to 17*s.*, are those the net wages after all deductions are made ?—Yes.

13,751. You have spoken of a dormitory or long bed room, is there a chimney in it ?—No.

13,752. Is there no opening for ventilation ?—Yes; there is a window for ventilation in the end near the roof.

13,753. Is the air pure in the morning ? Have you been in it before the men are out of bed ?—I have not been in it before some of the men are up, but I go in perhaps when there are five or six in bed and before the windows have been opened, and I have found the air then pretty good, if they allow the ventilation to remain open, but with 14 or 15 men there are various opinions, and those who cannot stand it will object to its being open.

13,754. Is that room better or worse ventilated than the bed rooms of labourers generally are ?—I think it is as good as any labourers sleep in.

13,755. Are the miners much annoyed by the powder smoke ?—No ; if the air is pure the powder smoke does not injure them much. I have never considered powder smoke of much annoyance if the air is pure.

13,756. If you were to reverse the working of your fan so as to draw the air out instead of forcing it in, the men would not have to pass through the powder smoke ?—That is true, but I never saw it done.

13 757. Do you not think it would be an improvement ?—I do not know.

13,758. Do you see any practical objection to doing that, just to turn the fan round and make it draw the air out instead of forcing it in ?—The fan would not draw ; work the fan which way you would it would force.

13,759. Are you not aware that you may make it draw as well as force ?—Not a fan ; I have proved it ; I have reversed it and turned it all ways, but it always forces ; our fan will not do it otherwise.

The witness withdrew.

Mr. JAMES POSTLETHWAITE examined.

Mr. J. Postlethwaite.

13,760. (*Chairman.*) Do you belong to this district ?—Yes.

13,761. Are you a native of it ?—Yes.

13,762. What is the name of the mine or mines that you are connected with ?—The Keswick mines.

13,763. Of what do they consist ?—They are lead mines.

13,764. Of how many mines are the Keswick mines composed ?—There is Brandley Thornthwaite and Smeltmelbeck ; but these are not working at present ;

we are only working the Brandley mine; still the company is the Keswick Mining Company.

13,765. Where is that mine situated ?—Near Lodore; the one we are working; it is at the high end of Keswick lake; the south-west end.

13,766. What is the ore that is produced ?—Lead; silver lead ore.

13,767. What proportion of silver is there in the lead ?—From 10 to 11 ounces per ton.

13,768. How many men do you employ there altogether ?—Seventy.

13,769. How many of them work underground ?—I believe that forty-four is the exact number.

13,770. How do the men work; in shifts ?—Yes; in 8-hour shifts.

13,771. Do they work for the whole 24 hours ?—Very rarely; we have one place or two where we work all round the 24 hours; but generally we work only two eight hours in the 24.

13,772. Is it a wet mine ?—It is rather wet.

13,773. How is the water pumped out ?—It is pumped out by a steam engine.

13,774. What is the greatest depth at which you are working ?—Fifty fathoms.

13,775. Is that the shaft ?—Yes.

13,776. How many shafts are there ?—We have several shafts ? there is one large engine shaft for pumping and drawing, and three shafts for ladderways, and one for air only; ventilation.

13,777. What is the number of levels ?—Four.

13,778. What is the greatest distance between any one shaft and the other ?—50 fathoms.

13,779. Do the men go down by ladders ?—They go in both ways; some we take down by the engine, just as the men choose; others go by ladder.

13,780. What have you on the engine; is it a skip or a cage ?—A cage.

13,781. A safety cage ?—No, we have not a safety cage.

13,782. You bring up the ore in waggons ?—Yes; it runs into the cage.

13,783. Do you call them bogies ?—Yes.

13,784. Have you ever had any accident from the men going down ?—No; we had one man killed by the cage coming in contact with him; he placed himself in the way of the cage as it was going down some years ago, and it broke his arm, and he fell and was killed; that is the only accident that we have had; we have never had a cage fall.

13,785. (*Mr. Holland.*) Was he in one of the higher levels ?—He was in one of the middle levels.

13,786. (*Chairman.*) How are the bargains let ?—By fathom.

13,787. Are the men paid every month ?—Every month.

13,788. Do you keep a month in hand ?—Yes.

13,789. What do the men generally earn ?—The underground men who are engaged in blasting earn 16*s.* per week; we have a few what we call skilled men who have 1*l.* a week, who look after the timbering and the dressing, but the ordinary men have 16*s.* a week.

13,790. Do the men reside on the mine ?—Not many of them.

13,791. What distance do they reside ?—About four miles the greatest distance, the greatest number of them, and from that to two miles.

13,792. Have you a lodging house on the mine ?—Yes.

13,793. Do the men sleep there ?—A few sleep there, not many; we have accommodation if they choose, but they prefer going to their homes.

13,794. Do they go that distance every day ?—Yes, they would rather do that than lodge away from their homes.

13,795. When they come out of this wet mine, do they change their clothes ?—Yes, all of them.

13,796. Where do they change ?—In the engine-house, and above the boiler, we have a place there for drying their wet clothes.

13,797. Have you ever had a case of men who were going down the ladders, falling from the ladders ?—I have had men fall a little way twice, but they were very little worse. We have stages in the ladders at a certain distance.

12,798. At the foot of each ladder it is sollered over ?—Yes, a man would only fall a few yards or feet, and not be any the worse; they generally stop on the stage.

13,799. If that was not the case, they would fall to the bottom and be killed ?—Yes.

13,800. Have you had any accidents from blasting ?—Yes, we have had two, one rather serious, and the other slight. The men both recovered, and are working again.

13,801. Were you able to ascertain the cause of the explosion ?—Not certainly, but I conclude that it was by stemming the holes too hard, and with too hard material.

13,802. (*Mr. Holland.*) Do you use iron stemmers ?—Yes.

13,803. (*Chairman.*) What is the material which you use for tamping ?—A very soft clay slate; it is a rare occurrence to have a hole explode in the hands of the men.

13,804. Have you a sick club ?—Yes.

13,805. Is that for accidents ?—For accidents and sickness both.

18,806. What do the men pay ?—1*s.* a month, each man.

12,807. What is the allowance if a man is sick ?—They receive when sick, or from accident, 7*s.* per week.

13,808. Is there a doctor attached to the mine ?—We have not one at present, we have had one until lately; there was some little dissatisfaction about it, and the men now find their own doctor, they prefer that.

13,809. Have you any men suffering from shortness of breath ?—We have.

13,810. What aged men are they ?—We have one aged 45 who is quite unable to work; but he did not receive his injury in our mine.

13,811. Where did he work before ?—In Coniston copper mines; he worked for four years at our place, and gradually became worse, and for the last four years he has not worked at all, he is lying upon the club.

13,812. Have you any men working, who are suffering from shortness of breath ?—Very little; our men are very sound and good. I suffer as much myself as any of them.

13,813. Do you suffer ?—Yes, I am a little affected.

13,814. Do you think that that is from working ?—Yes, not in this mine, but in some mines in the neighbourhood, one in Loweswater; that is not working now.

13,815. Was it bad air ?—Very bad; I only worked three months in it, and if I had stayed a little longer I should have been done.

13,816. How did it affect you ?—I had a sensation, a pain in the head, the pain goes right through your head, and before the end of the shift you can scarcely bear your head.

13,817. Is there any place where that is the case now ?—I do not know that we have any in this neighbourhood very bad. In Alston the men suffer very much from it; that is in dry mines, and they have a great deal of dust which rises from the breaking of the stone. We consider a dry mine the worst; a wet mine is more healthy, it keeps down the dust arising from the smoke, blasting and breaking of the stone.

13,818. How do you ventilate your mine ?—By shafts and levels both; we have a main shaft, and then we take levels from it at every ten fathoms in height; for instance, we have a level 20 fathoms deep, another 30, another 40, and another 50, there are only ten fathoms between those levels, and at the distance of about 15 fathoms in length we put a hole through between those levels, for the purpose of ventilation.

13,819. (*Mr. Holland.*) Going to up the surface ?—Yes, but not in a direct line.

DERWENT WATER.

Mr. J. Postlethwaite.

3 Oct. 1862.

13,820. (*Chairman.*) It is not the whole way to the surface, is it ?—The highest level is ventilated to the surface, the next in depth is ventilated "by rises" into one above it, and so on to the lowest level, but these rises are not always at the same point, consequently not always in a direct line.

13,821. You said that you had one air shaft ?—Yes, but they all serve as air shafts.

13,822. Are they up-cast, or down-cast shafts ?—They are both.

13,823. (*Mr. Holland.*) Does the air always go in the same direction ?—No.

13,824. (*Chairman.*) It changes according to the weather ?—Yes, and according to which way the wind blows ; we are in a hill.

13,825. There is no one particular shaft which is always up-cast ?—The engine shaft, the large shaft, is always up.

13,826. Does that stand on a higher level than the others ?—It is not the highest, it is the largest shaft.

13,827. Why do you suppose that it is always up-cast ?—I should fancy that the pumps have something to do with it, but chiefly because it is the deepest shaft in a straight line.

13,828. To keep a motion ?—Yes ; I never recollect seeing it down-cast in the engine shaft, but the others change.

13,829. Are the wages which you have stated clear of deductions ?—Yes.

13,830. What are the deductions ?—We provide tools, blasting powder, candles, and all material, which is all deducted from the men.

13,831. What do they pay for candles ?—7*d.* a pound.

13,832. And what for powder ?—8*d.* a pound.

13,833. And for sharpening the tools they pay ?—Yes, we have a stated price which we charge for the tools and sharpening as well.

13,834. (*Mr. Davey.*) Do you ever find any difficulty before you communicate these winzes from one level to another ?—Yes ; that is where we have our difficulty.

13,835. How do you remedy that ?—We never go so far but what we can manage it without artificial means. We have a difficulty, but we get through the difficulty ; we put fewer men ; for instance, if I have four men working at the end of the level and I put four more men to rise a winze through, probably before I get that winze through they have not sufficient air, and I am obliged to reduce the men one half, and to leave the place during the nights.

13,836. Do you use any artificial means of forcing in air ?—Yes ; I have had both a little fan blast and a blast caused by water and taking pipes along the level.

13,837. Could not you force in sufficient air to allow you to work the whole of the time ?—Yes, we can do so but we do not like artificial ventilation, we would rather have it natural.

13,838. Would it not be better to use artificial means than to punish the poor man by working in poor air ?—Yes ; but that punishment, if it is punishment is of short duration ; we can easily work from the last rise, 15 fathoms, and the little difficulty is before we get the rise quite through, probably in the last month, so that all this outlay and expense in providing artificial ventilation would only be for the month.

13,839. Would it not be more economical for the adventurers to use that trifling expense than to reduce the force in these levels ?—No, not in lead mining ; we have a need to make these rises or winzes as explorations ; we consider that we never ought to go beyond the 10 or 15 fathoms upon a vein provided it is dead without making these openings between one level and the other for fear we should pass over the lead.

13,840. What is the width of the vein ?—It varies from six feet to one foot.

13,841. As to its richness does it vary ?—It is very irregular.

13,842. What is the monthly produce of your mine ?—Twenty-four tons.

13,843. What is the value per ton ?—12*l.*

13,844. Do the men who work with you come pretty much from this neighbourhood or from other mines ?—Most of them are natives of Cumberland.

13,845. And you consider that those who come from other places do not enjoy such good health as your own men ?—I am not certain as to that. I have seen those men coming from Alston a little affected at an earlier age than the men are here. I have one or two Welchmen and they are healthy.

13,846. When you find one of these miners affected by that disease, if you remove him to a healthier place or give him rest, does he improve ?—They may remain stationary, they never recover.

13,847. Not even if they give up that kind of life and lead another ?—No ; I have not worked under ground myself for the last 12 years and I get a little worse ; a man will not recover, but the progress of the disease will be arrested, or partially so.

13,848. But the men working in this neighbourhood are generally in pretty good health ?—Yes.

13,849. (*Mr. Austin Bruce.*) Is the mine at Loweswater still in operation ?—No, it is full of water, and the machinery is all removed.

13,850. Did other people suffer there as well as yourself ?—I am not aware that there was ever any great effect produced in that respect.

13,851. At what age do the men begin working in your pit ?—About 18.

13,852. Have you any boys younger than that ?—No, I do not put in any before they are 18 ; I use boys on the surface.

13,853. Have you at this moment any men suffering from the miners' asthma ; difficulty of breathing ?—Two, very slightly.

13,854. (*Mr. Holland.*) You have said that there are several a little affected ?—I am a little affected, but my men are very little affected ; they are quite able to do the work, and they do not complain of it.

13,855. (*Mr. Austin Bruce.*) Up to what age do they work with you ?—I can scarcely say. I had two old men who died last year who were 70 years old.

13,856. Had they worked up to the last year ?—Up to the last. My father died two years ago at the age of 65.

13,857. Is there any difference in their appearance and that of the population who work above ground ?—Very little indeed in these mines.

13,858. Are they an orderly well conducted population ?—Yes, our men are very steady.

13,859. Do you ever have any trouble with them about wages ?—No, I do not know that I have, or very little. Once since I have known the mine there was something like a strike, but not on wages, but more as regarded the time of working. The wages are similar all round.

13,860. Can most of them read and write ?—Yes.

13,861. Have you any who cannot ?—Yes, I have.

13,862. Men of this district ?—No ; I do not know that I have any in this district. I have two or three Irishmen who cannot read and write.

13,863. (*Mr. Holland.*) Is it common for miners to work until 60 ?—Yes, I should think it is.

13,864. Is it as common among miners as among farm labourers ?—No, I should think not ; decidedly not. Farm labourers are more healthy.

13,865. Are there as many miners as farm labourers do you think working at 50 ?—No, yet there are many working at that age.

13,866. Are miners more liable to affections of the chest ?—Yes, I should think so.

13,867. Asthma ?—Yes.

13,868. Does it often become very bad ?—Yes. I have seen one very bad, and who can scarcely work.

13,869. There is not much climbing in any of the mines here, is there ?—There is climbing of the ladder.

13,870. How deep is it ?—Only about 50 fathoms.

13,871. And many do not climb so far as that ?—No.

13,872. Many 20 or 30 or 40 fathoms ? — Yes, and then we take the men up by the cage, if they choose it.

13,873. You have spoken of a pain in the head produced by bad air ; is that common ?—Yes. While you are in the place it affects you with a pain in the head.

13,874. Does that air affect the candles much ?—Yes ; they will scarcely burn ; we have to place them horizontally.

13,875. Is it a common thing for you to slope the candles ?—No.

13,876. Is it very uncommon ?—Yes ; something is very far wrong if we have to do it.

13,877. Does the powder smoke hang long with you ?—No. The men retire back after blasting, and they will stay ten minutes or a quarter of an hour, and when they go back most of the smoke has gone away.

13,878. Is it very uncommon for them to stay more than a quarter of an hour ?—Yes. I do not know any place in our mine where it is necessary to stay longer than that.

13,879. Do you speak of mines generally in this neighbourhood ?—Yes ; I am acquainted with most of the mines in this neighbourhood.

DERWENT-WATER.

Mr. J. Postlethwaite.

3 Oct. 1862.

13,880. Would it be considered very bad if they stopped half an hour or an hour ?—Yes, decidedly.

13,881. It does occasionally happen ?—I have seen places where it is scarcely ever entirely clear, but a little smoke is not always an indication of bad air.

13,882. But the stopping is not to such an extent as that they cannot work ?—It is very uncommon for them to have to stop more than a quarter of an hour.

13,883. Do you think it more economical to reduce the speed of the work than to introduce artificial ventilation ?—Yes.

13,884. What is about the cost of putting up a fan and a pipe of 20 fathoms long ?—20*l.* perhaps. There is a long length of pipe to take.

13,885. It would cost very little to shift that from one level to another ?—You would have to shift it, and to lay the piping again.

13,886. That would not cost much would it ? About what would it cost to shift it from one level to another ?—I could not say less than 10*l.*, and I do not know that I could do it for that.

13,887. Can the men work with equal effect in such air ?—I have never seen artificial ventilation so efficacious and complete as that pracured by rises and winzes from one level to another.

The witness withdrew.

Adjourned to To-morrow, at Patterdale.

PATTERDALE.

Saturday, 4th October 1862.

PRESENT :

The Right Honourable Lord KINNAIRD, K.T.	H. AUSTIN BRUCE, Esq., M.P.
NICHOLAS KENDALL, Esq., M.P.	RICHARD DAVEY, Esq., M.P.
JOHN ST. AUBYN, Esq., M.P.	P. H. HOLLAND, Esq.

The Right Honourable Lord KINNAIRD, K.T., in the Chair.

Mr. WILLIAM PHILLIPS examined.

PATTERDALE.

Mr. W. Phillips.

4 Oct. 1862.

13,888. (*Chairman.*) What is the name of the mine or mines of which you have the charge ?—It is called the Greenside lead mine.

13,889. Is that the only mine of which you have charge ?—Yes.

13,890. Is it worked by a company ?—Yes.

13,891. What is the company called ?—It is called the Greenside Lead Mining Company.

13,892. Are there many partners in the company ?—I think there are 14 partners.

13,893. How many men are there employed altogether ?—The total number employed is somewhere about 300 men and boys.

13,894. Do you smelt the ore on the mines ?—Yes.

13,895. How many of these men are employed underground ?—About 150.

13,896. How do the men go down underground ?—They enter the mines by going into a level or tunnel.

13,897. Are there any shafts in the mine ?—There is one.

13,898. How many levels are there ? — There are six.

13,899. Does the shaft communicate with the lowest level ?—Yes.

13,900. Is the shaft used as a drawing shafts ?—Yes.

13,901. Is it used also as a ventilating shaft ?—Yes.

13,902. Is it an up-cast or a down-cast shaft ?—It is a down-cast shaft.

13,903. Is that high up the level ?—No, it is sunk in the bottom of the low level; about 400 fathoms from the entrance.

13,904. How many levels are there above the shaft in the side of the hill ?—There are five.

13,905. Are the mines all worked by levels from the day ?—Yes.

13,906. Do the levels communicate with each other by winzes ? — Yes ; they communicate with each other by winzes and stopes, or headings, and roofing, as they term it here.

13,907. Is there much water in the mine ?—Not much, about 1,000 gallons in every 24 hours.

13,908. Which is the wettest level ?—The bottom or the deepest ; the 36-fathom level, sunk from the present Low Horse Level.

13,909. Is the water pumped out by a water-wheel ?—It is pumped out by a hydraulic pumping engine.

13,910. Is the work let to the men by tut-work ?—Yes ; so much a fathom.

13,911. Is it let to them quarterly or monthly ?—Quarterly. Occasionally we let bargains according to circumstances.

13,912. But is the work generally speaking let quarterly ?—Yes.

13,913. Is it let to one man ?—No, generally to two and to four men ; we have three companies of six men working three cores.

13,914. Do you work much by night shifts ?—No ; there are only three companies working night shifts or cores ; they are driving levels on the lower level, necessary work that we have to force for the

PATTERDALE.

Mr. W. Phillips.

4 Oct. 1862.

general working of the mine; we do not work much by night-work; it is eight hours a day, two shifts; sometimes they work all one time; if they are in a wide part of the vein, perhaps four are employed at the same time.

13,915. The work being let for three months at a time, may the men go to their work just as they like and at what hours they like?—Yes; and work longer if they think proper, they are not compelled to time, but expected to work 8 hours per day.

13,916. Do you make the agreements with one man?—No, with all the partnership.

13,917. Does each of the partners sign?—No, they are all present, but one signs.

13,918. Do they live at some distance from the mine?—Some live at Keswick, and some at Penrith, and some in the neighbourhood, and in different parts.

13,919. What is the greatest distance that any of them live away?—I should say that some of our men will come 16 or 18 miles, I think that is the greatest distance.

13,920. Have you any lodging-house on the mine to accommodate the men?—We have several.

13,921. How do the men manage?—They have beds in those places, and the company provide them with coals. They come on Mondays about 12 o'clock, and leave again on Fridays at 12 o'clock, and they calculate to work five eight hour shifts or cores during that period; they stay at the mines from the Monday till the Friday.

13,922. How many men generally sleep in each of the lodging houses?—Some of the shops would hold perhaps 40; they are large shops.

13,923. What is the size of the room where these 40 men would sleep?—Our new shop I should think is, although I never measured it, above 60 feet long; it is a very high house, and the room stands 12 or 14 feet high.

13,924. Do the men sleep one above the other?—They have iron bedsteads and some wooden, like hammocks on board a ship, one above the other.

13,925. How often are the men paid?—We sub every month and pay the balance up every three months; the sub is 2*l.* per month.

13,926. Do you not keep a month in hand?—No; we balance up at the three months end; they will work a week or so with a new bargain; but that does not interfere with it.

13,927. What is the highest amount that any man can earn, or any set of men?—25*s* a. week.

13,928. What is the lowest sum they can earn?—That depends upon how the bargain turns out? sometimes not more than 10*s*.; but I have known them to come as low as 8*s*.; not lower than that; sometimes the bargain goes against them, and at other times they get 20*s*. or 25*s*. or 18*s*.

13,929. Are the men principally young or old men?—There are both classes of men; those receiving low wages are generally older men; the young able men do not come so low as that.

13,930. From what depth have they to climb the ladders?—Scarcely any at all; there are no ladders; it is all worked away by stopes.

13,931. There is nothing then to prevent the old men from performing their work?—No; they can walk right to it.

13,932. How far have you ever driven any of these drifts from the day or from the shaft?—The low horse level is about a mile driven from the entrance.

13,933. At the far end how is that ventilated?—It is ventilated by the north part of the mine.

13,934. Does it join the north part of the mine on the other side of the hill?—Yes.

13,935. Have you any level driven from this side that has not reached the north side of the mine?—No; we have no other one.

13,936. What is the greatest distance that you have ever driven a drift from the day without being a through drift?—Three hundred fathoms. We use a blast generally for such levels; about 300 fathoms we use a waterfall.

13,937. How do you ventilate it?—By a waterfall; the pipes are cast-iron pipes of five inch bore, six feet long, each with spigot and faucet joints.

13,938. Are those carried to the end?—Yes.

13,939. How near are they carried to where the men are driving?—Sometimes within nine feet; but it depends upon circumstances; sometimes they are perhaps three or four fathoms behind; but generally speaking they are within two or three fathoms.

13,940. Does that give perfect ventilation?—Yes.

13,941. Have you some men who are affected in their breathing?—There may by chance be one, but not generally.

13,942. Have you none now working in your mine who are at all affected in their breathing?—No man who is disabled is employed to go inside or who is affected in the lungs.

13,943. How long have you had the management of the mine?—Going on three years.

13,944. Was there not some disaffection before you came?—Yes.

13,945. Had that anything to do with the measuring of the work?—It was on account of that; and as to a manager who was here before I came here; that was the cause of it I suppose.

13,946. In what way was the mode of measuring different from the plan you introduced?—I do not know; I never saw it measured.

13,947. But it was not measured I suppose as you measure it?—I do not know; I never saw it measured; I measured my own.

13,948. Are the men satisfied with your mode of measuring?—They are at liberty if it is not right to prove it.

13,949. Is there no dissatisfaction felt now?—No; they are all satisfied with the measurement now.

13,950. What quantity of candles do you allow to the men?—Any quantity that they require; sometimes four men will burn perhaps six dozen pounds and sometimes seven dozen pounds in a quarter; but that just depends upon the work or time which they may work.

13,951. What do you charge them for the candles?—7*s*. a dozen pounds; sometimes 6*s*. 6*d*.

13,952. According to the contract price which you pay for them?—Yes.

13,953. And what do they pay for the powder?—That is the same; we charge them 14*s*. for a quarter of a cwt.

13,954. What other deductions are there from their wages?—There is for the powder and candles.

13,955. And the tools?—The tools.

13,956. Do they pay for sharpening the tools?—No; they pay only for putting on the steel and repairing.

13,957. Are the tools weighed?—Yes; they are all weighed.

13,958. Have the men to pay for the wear and tear of the tools?—Yes.

13,959. Do they ever dispose of the candles, or take them home?—I do not know anything about that.

13,960. As they pay for them, you are indifferent about it?—We supply them with candles and powder and charge them for them, and whatever they do with them is for themselves to look to; we give them a fair valuation for cutting the ground.

13,961. Have there been any accidents in your mine lately?—Not of any consequence; sometimes they might nip a finger, but there have been no accidents since I came here.

13,962. Is there no particular kind of accidents that the men are liable to from working in the mines?—The men are liable to accidents in all mines.

13,963. Do you mean from blasting, or from the falling of the ground?—There have been no accidents from either of those causes since I came.

13,964. There have been no accidents from powder blasting?—Not since I came.

13,965. Do the men use the patent fuze or a straw?—They use a straw.

13,966. Do they use a copper pricker?—Yes.

13,967. What kind of tamping rod do they use?—A long soft iron rod.

13,968. Have you a club in your mine?—Yes.

13,969. Is it a sick club or an accident club?—An accident club.

13,970. Is there no sick club?—Not that I am aware of.

13,971. What do the men contribute to the accident club?—I think they contribute 1*s.* a quarter.

13,972. Is there a separate account kept of that club?—Yes.

13,973. Do you know how that stands?—Not exactly; but I think they have a good deal of money in hand, perhaps above 250*l.*

13,974. How many men contribute to it?—Generally all the men are requested to pay to it.

13,975. Including those who are employed in the blast furnaces?—Yes; wherever they are employed.

13,976. Do the boys make a smaller contribution than the men?—Yes; some pay 6*d.*; some pay the price of men, according to their size.

13,977. What is the youngest age of the boys employed in your mines?—We have none in the mines, but on the workings; perhaps nine or ten years of age the youngest.

13,978. Do the men work double or single-handed?—Double-handed all of them; that is the general rule.

13,979. Is there any provision made for the education of the children?—Yes; we have a labourers' school at the mine.

13,980. Do the men pay for it?—No; the company generally provides them with books.

13,981. Who supports the school?—Mr. Marshall and Mr. Howard, Lords of the Manor, sometimes give a trifle; there is no schoolmaster fixed; the miners do it themselves.

13,982. Do you mean an evening school?—Yes, or during the day when it is wet.

13,983. (*Mr. Kendall.*) Were you a working miner before you became an agent?—I was.

13,984. Where did you work as a miner?—I worked in this neighbourhood; in Furness.

13,985. What countryman are you?—I am a Cornishman.

13,986. Have you worked in any Cornish mines at all?—Yes.

13,987. Where?—At Wheal Buller and Tresavean United mines.

13,988. Are the men in this neighbourhood very healthy?—Yes; they are above the average.

13,989. Do you perceive any difference between the miners in this neighbourhood, particularly those employed in the blast furnaces, and other miners?—No; I see very little difference in their health.

13,990. You think that the one class is as healthy as the other?—I do not see any difference in them.

13,991. Is there any difference in the amount of wages which they earn?—Of course the one gets standing wages, and the others work by contract.

13,992. Are the average earnings of the smelters the same as the wages of the others?—That is 20*s.* a week; the roasters earn 17*s.* 6*d.*, and the separators have 18*s.*

13,993. What are the average wages of the working miners?—About 16*s.* a week, from that to 17*s.* a week.

13,994. You have had a good deal of experience in Cornwall and in this district; in your opinion are the miners in Cornwall as healthy as they are here, or not?—They are not so healthy.

13,995. To what do you attribute that difference in the comparative health of the miners?—It is owing to the deepness of the mines and the mines not being so well ventilated.

13,996. In Cornwall they have not the same means for ventilation as you have here?—Of course they have not; they have not the same advantage, that is, not without going to enormous expense, and of course the mines could not be worked, that is a point of calculation.

13,997. Do the parties all sign when you set the bargains?—No; one of the partnership does it; they are all present.

13,998. Has the one who signs the power of dismissing any of the members of the party?—No; they have no power to dismiss any man.

13,999. They must first of all consult with you?—It belongs to me to say whether a man shall be discharged or not.

14,000. If one man displeases his comrades, can you take him out from them?—Yes, I can take out one and put in another, and separate them.

14,001. Is there any one or more appointed to take care of the dormitory where the men sleep, and to superintend?—The men themselves do it; there is a rule written up, there are so many chosen by the parties there, and they do it in their turns; one does it one week or a fortnight, and so on.

14,002. Do they choose a superintendent among themselves, and does he make all the necessary arrangements for them as to sleeping?—Yes, and then I go through the place, and if the things are not kept properly clean, I turn round upon the parties who have had charge of the shop, and I either fine or caution them.

14,003. What proportion of silver do you find in a ton of lead?—There are from 12 to 17 ounces to a ton.

14,004. Do you use much powder?—We use a great deal; about 10½ tons per year.

14,005. How much do you use in the course of a month or a quarter?—One company of four men will use from eight to nine quarters of a cwt. of powder in a quarter or three months, sometimes seven, and sometimes eight.

14,006. Is your ventilation so good that the powder smoke does not lie long?—It does not lie at all; it cannot stand because the draught is very strong.

14,007. It does not hang about so as to hinder the men from going to work almost immediately?—No, the men go right to their work as soon as the hole goes off.

14,008. (*Mr. St. Aubyn.*) Have you any Cornish miners working under you in your mine?—No, I think not one, there are one or two Devonshire men working there.

14,009. Are they men who have worked in the Devon mines near Tavistock?—I do not know anything about that.

14,010. You speak from your own experience when you say that the men in this neigbourhood are more healthy than those who work in the Cornish mines?—I speak from my own experience of course in the other country.

14,011. You ascribe the difference to better ventilation?—Yes; this is a mountainous district, and so is Cornwall, but it is table land. The mines are sunk down below a great depth; but here they are driven through the mountains. There are natural advantages here.

14,012. Do you think that the amount of disease is as great here as amongst the Cornish miners?—No, it is not so much by 10 per cent., and more.

14,013, Is there no climbing in your mines?—Nothing of any consequence, perhaps a few fathoms just over the stope in the footways; no such climbing as they have in Cornwall.

14,014. (*Mr. Davey.*) You did not allude to the mines that you had been working in in Cornwall that were so unhealthy?—Yes, the mines that I have worked in generally.

14,015. You spoke of the Tresavean mine?—Yes, and that was a very deep mine. I worked at the 236 under adit.

14,016. Did you work in that mine before the man-engine was introduced?—Yes, I worked before, and when I was working there it was down at the 248.

PATTERDALE.

Mr. W. Phillips.

4 Oct. 1862.

14,017. What is the size of the vein in your mine here generally ?—The vein is from 20 to 60 feet wide.

14,018. How is the ore distributed in it ; do you find it in masses ?—It is in masses, and sometimes in strings, sometimes you find a mass two or three fathoms long, and a foot or two wide, then it becomes split up into a lot of strings, and it is mixed with quartz, pyrites, hornblend, and mica, and zinc, and several other things.

14,019. (*Mr. Austin Bruce.*) You have stated that there are 14 partners in these works ?—I believe so.

14,020. Are they gentlemen resident in this country, or strangers ?—Mr. G. M. Mead is the principal shareholder, and Mr. John Jamieson of Penrith is another.

14,021. Generally speaking, are they connected with this district ?—I believe they are generally ; the principal parties are connected with this district.

14,022. At what age do the miners begin to work underground ?—About the age of 21.

14,023. Have you any boys employed underground ?—No ; on the ground we have what are called washers. We have one little boy in the mines turning the points.

14,024. How are the miners usually employed before they go underground ?—They are employed at washing I presume.

14,025. Or in some way on the outside ?—Yes, sometimes we take men in from the farms, they come here when out of employment.

14,026. Do you think that the circumstance of their coming to work in the mines so late has anything to do with the good health that they enjoy ?—No, the men in this country are not worked in their youth as they are in many districts.

14,027. And you think that that has something to do with it ?—Yes, the boys are trained up upon farms, and they come to the mines when they become men to obtain employment.

14,028. After they have worked in the mines for some years, do you observe any difference between them and the men who work in the open air ?—Of course a miner generally has a different countenance from a man who is in the habit of working in the open air, the miner is not exposed to the sun.

14,029. I mean with regard to their health and strength ?—The miners generally are very strong.

14,030. Up to what age do they continue to work in your mines ?— We have some of them who are nearly 70 years of age, above 60 a good bit, at any rate.

14,031. Are they able, generally speaking, to read and write ?—I think they are generally.

14,032. (*Mr. Holland.*) Do the miners in this district look as young as other men of the same age ?—Yes, they have rather paler complexions.

14,033. Are they in your opinion as muscular as other men ?—They are.

14,034. Is disease of the lungs at all prevalent among them ?—It is not so here ; there may be a chance case or so for anything I know, but you do not see anything, it is not prevalent.

14,035. Among your men, how many of them are at all affected in that way ?—I do not know of anyone ; there may be one.

14,036. Of course there are many miners whom you know besides those employed in your mines ?—Yes, many hundreds.

14,037. Can you state positively that it is not the fact that these miners break down in health when they reach 40 or 50 years of age ?—I do not think they do in this country.

14,038. You are aware that they do in Cornwall ?—Yes, but it is quite different there.

14,039. Is there any disease here like that which you have seen in Cornwall ?—No.

14,040. Do the candles always burn freely in your mine ?—Yes.

14,041. Have the men never to slope them ?—No, we have no poor air.

14,042. Does the powder smoke clear away quickly ?—Yes.

14,043. Does it hang about for more than a quarter of an hour, so as to stop the men working ?—Not so as to impede our working at all.

14,044. (*Chairman.*) Are your men generally speaking temperate ?—They are pretty well in that respect upon the average ; there are good and bad in all places.

14,045. (*Mr. St. Aubyn.*) Do you think they are as temperate as miners are in the west ?—There are exceptions among them the same as among other people.

The witness withdrew.

Dr. JAMES RUMNEY examined.

Dr. J. Rumney.

14,046. (*Chairman.*) I believe you are the medical man of this district ?—Yes ; but I am not engaged in the mines.

14,047. Are you consulted by the miners ?—Yes, frequently.

14,048. But you are not regularly engaged to superintend them ?—No.

14,049. Is there any particular disease to which the miners of this district are subject ? — Asthma generally accrues.

14,050. Do you think that that complaint is more prevalent among miners than among other classes ?—Yes ; but the Greenside mines are very nearly as healthy as any agricultural district.

14,051. Are the men working in the Greenside mine subject to asthma ?—Yes.

14,052. What do you consider that arises from ?—From the carbonic acid and the want of oxygen or pure air.

14,053. That is what produces the effect ?—Yes.

14,054. Do you think that they have become troubled with asthma from working in the Greenside mine or in other mines ?—I think that the Greenside mine causes it as well, but at Alston it is far worse, those who come here are generally diseased.

14,055. Have you ever made a post mortem examination to ascertain how the lungs were affected ?—I have only had one since I have been here.

14,056. Was that a case of disease of the lungs ?—Yes.

14,057. Do you think that that was brought on by working in the mines ?—Yes, but not here, it was brought on at Alston.

14,058. What was the effect produced upon the lungs ?—Distention of the air-cells of the lungs.

14,059. (*Mr. Holland.*) Was there any contraction of the bronchial tube ?—No ; it was quite chronic.

14,060. (*Chairman.*) Was there any matter to be found ?—None whatever ; it just came on spasmodically.

14,061. Was it a disease quite different from consumption ?—Yes ; there is no bronchitis or consumption here ; no positive tubercles.

14,062. If the miners once become so affected they do not get rid of it ?—No ; this man to whom I have referred was obliged to get up three times at night to put his head out of window.

14,063. (*Mr. Holland.*) Was there any disease of the heart in that case ?—None.

14,064. (*Chairman.*) Are there any cases that could be seen now ?—Yes ; I know four or five cases of men who do not think of seeking for advice.

14,065. But you think that they are affected ?—Yes ; the lower lobes of the lungs are generally very much affected.

14,066. (*Mr. Holland.*) Have you noticed this di-

sease among the Alston men and not among the men of this district ?—I have not noticed it much among the men here ; lead paralysis is more common here, and dropping of the hand.

14,067. Among the miners ?—Among the smelters.

14,068. Not among the miners ?—No ; it is accompanied with lead colic.

14,069. Is there any excess of rheumatism among them ?—No ; except among the lads who are employed at the washing ; not among the miners.

14,070. Have you met with cases of asthma accompanied with great expectoration ?—Not so many ; they are very rare up here.

14,071. Is it rare for the miners to have asthma at all ?—No.

14,072. Do you mean that simple asthma is common ; but asthma with great expectoration is uncommon ? —Yes.

14,073. At what age have you noticed asthma to commence ?—It commences at any age.

14,074. When they are very young ?—About the age of 45.

14,075. Does it seldom come on before ?—Seldom before 40 or 45 ; that is about the average.

The witness withdrew.

Mr. Jacob Johnson examined.

14,076. (*Chairman*). Are you manager or captain of a mine ?—I am a workman.

14,077. In what mines ?—The Eagle Craig mine, which is about three miles from here.

14,078. Is that one of the Greenside mines ?—No.

14,079. Do you manage it ?—Yes, with the widow ; I have the management part for the widow ; her husband and I were partners, and he wished me to take the management at his death.

14,080. You are only working it on your own account ?—We have a grant from Mr. Esdaile.

14,081. Is it a lead mine ?—Yes.

14,082. How long has it been worked ?—It is an old mine, a very old one.

14,083. How long is it since the workings have been resumed ?—We have had the take of it since the 7th of January last.

14,084. How many men are there working in it ? —Four.

14,085. What quantity of lead have you been able to obtain since you came ?—I cannot say just now.

14,086. What is the length of the drift in which you are working ?—It will be about 60 fathoms long from the day where we get our metal.

14,087. Have you long worked as a miner ?—Yes ; I have wrought in mines all my life.

14,088. In what mines ?—I belong to Alston moor ; there were only three men at Greenside when I came and it was then but little wrought ; I have been a deal in Patterdale, ever since I came from Alston moor, about 37 years ago ; there were three workmen at Greenside when I came, and I made the fourth.

14,089. Did you suffer at all from any complaint at Alston Moor ?—I wrought for the London Company, and I thought it was going to injure me ; that is, the bad air ; and I saw a captain from Greenside, and I told him that I would work with him, and he said that he would set me on.

14,090. Had you worked in bad air at Alston ?— A very great deal.

14,091. In what mine was that ?—The mine was called Nenhead.

14,092–3. Is that working now ?—Yes ; it is.

14,094. Is that a mine belonging to the London Lead Company ?—Yes.

14,095. Are there any men working here now who are affected from having worked in bad air ?—There are some, but not many I think. I do not know any that have been affected from working in the Alston mines. There are not many men from Alston here at present.

14,096. I suppose that at the 60 fathom level the air is quite good ?—As fine air as it can be.

14,097. You would not work in air if it were bad ? —I am getting to that age now that it would soon kill me. I am now 64 years of age, and that is when it affects people, when they become aged.

14,098. They are more affected then than earlier in life ?—Yes. Their nature is gone. They cannot stand it so well as the young men can stand it ; the old people cannot.

14,099. (*Mr. Austin Bruce.*) Did you ever work at Greenside ?—Yes. There were only three when I came, and I made the fourth.

14,100. How long did you work at Greenside ?— I have wrought for 35 years at the Greenside mines. I washed a great deal at Greenside.

14,101. Did you ever work in bad air at Greenside ?—Yes ; until we holed to the other, between one level and the other.

14,102. How long have you ever been working in bad air altogether ?—From my coming to Greenside it was about three years before we got the hole, and got a lead for good air.

14,103. Were you breathing bad air all that time ? —Yes ; all that time. We had as many as 14 or 16 candles to keep in to get to the work.

14,104. Did you ever find yourself the worse for breathing that air ?—No ; if it only kept from my knees. It used to affect my knees. I am weak in my knees.

14,105. Did any of the other miners who were working with you suffer from the bad air ?—They are dead.

14,106. But did they suffer from breathing the bad air at the time ?—Not that I can tell you. They never complained to me any further than I have just told you of, a little weakness in the knees.

14,107. Did that weakness in the knees go away when you began to work in good air ?—To be sure it did. It just affected the back side of the head sometimes.

14,108. Have you known any men in this district suffer from working in the Greenside mine ?—No ; I do not suppose there is. I never heard them speak and say that they had suffered anything. There is not such a mine in the north of England that is calculated to have so much air in it as Greenside mine has.

14,109. Do you speak of that mine as it is now or as it was when you were first working there ?—It is different now. She was not ventilated when I came to her first.

14,110. You speak of the mine as it is now ?— Yes. Until the place be ventilated from one hole to another there cannot be good air. We had no drifts then ; only just a close place going in from the day, 40 fathoms in.

14,111. Where were you born ?—At Alston Moor.

14,112. Do many of the miners who are employed at Greenside come from Alston Moor ?—There is only one that I know of that lives at the company's new cottages.

14,113. Is he any the worse for having worked there ?—No. He is a young man.

14,114. What wages did you get, one week with another, at Greenside ?—16*s.* or 17*s.* or on to 18*s.* a week, taking the year round ; not one quarter.

14,115. Do you mean that you earned as much as that after paying for powder and for candles ?—Yes ; after all the charges were paid.

14,116. Can all the boys and girls in this district go to school if they like to do so ?—Yes. There are plenty of good schools. Mr. Marshall has one below.

14,117. Do all the boys and girls go to school ?— Yes.

PATTERDALE.

Mr. J. Johnson.

4 Oct. 1862.

14,118. Do many of the workmen save money?—No; there is little of that I doubt.

14,119. Do they ever build houses with their own money?—I have never seen any that they have built yet.

14,120. Did you make your money as a workman?—Yes; I made it, the bit I have, it is not much, but I have made a good use of it.

14,121. Have you known many men as provident as yourself?—Not many, not that I have seen.

14,122. (*Mr. Holland.*) Was the air very bad where you worked during the three years you have mentioned?—Yes; very bad.

14,123. Would the candles burn?—Some days they would, but we used sometimes to have 14 standing back burning; we were watching for fear one should go out.

14,124. You might have been caught in the bad air?—It was to get a light when we wanted it, or we might have been left in the dark; the candles were lying down as back as could be, and when we had one standing in the better air we could go and get a light.

14,125. Did not that cause you to perspire very freely?—Yes.

14,126. Did you experience a trembling in the knees while you were so working?—Only then.

14,127. When you came out into the fresh air did you feel all right again?—Yes; but sometimes it just touched you at the back side of the head.

14,128. Did it affect your breathing at all?—Not mine.

14,129. Did the other men suffer in their wind at all?—No; they were old men, they never suffered anything that I ever heard of.

14,130. You say that the men are all dead who were then working there?—Yes.

14,131. At what age did they die?—At about 60 or 70.

14,132. What do you call an old age among miners?—That is a long age among miners, 60 or 70.

14,133. Did they suffer from cough?—I did not hear them complain of cough at all.

14,134. Were they particularly short winded?—No.

14,135. The miners do become old rather earlier than other men do they not?—Yes.

14,136. How much earlier do you think they become old?—I think there is 10 years difference.

14,137. For example does a miner of 50 look like a labouring man of 60?—Yes.

14,138. Without having any particular disease upon him?—Yes.

14,139. You would say that he is an older man of his years?—Yes.

14,140. As much as ten years older?—Yes, in appearance they look like it.

14,141. Are the miners particularly liable to rheumatism?—Yes, they are.

14,142. Have you heard them complain very much of that?—I have heard them complain very much of rheumatic pains.

14,143. So much as to lay them up?—Yes; it will lay them up.

14,144. Are many of the miners permanently disabled by rheumatism?—I have never seen any so bad as that, but you know sometimes it will lay them up for some time, until it goes off again.

14,145. They are not permanently disabled by it but only temporarily?—Yes.

The witness withdrew.

WILLIAM MARSHALL, Esq., M.P. examined.

W. Marshall, Esq., M.P.

14,146. (*Chairman.*) Are you one of the proprietors of the Greenside mine?—I am joint proprietor with Mr. Howard of Greystoke; we are proprietors as Lords of the Manor of an overleap, or piece of ground in dispute, a lease was made to that company by us jointly.

14,147. You have leased the mine to the present company?—Yes.

14,148. What is the company termed?—The Greenside Company.

14,149. Is the chairman of the Company Mr. Head?—Mr. Head and Mr. Jamieson are the principal parties.

14,150. In leasing the mine did you make any special conditions as to the working of the mine?—The condition of four men to keep the forehead open, and other usual conditions.

14,151. But you made no condition with regard to the men employed?—No, because we could not do so without interfering with the management of the mine; I may add that we have adopted along with them some means for the better management and comfort of the workmen.

14,152. How long has the mine been let to the present company?—Nearly 30 years.

14,153. Has there been any change in the management during the time?—There have been several managers.

14,154. Has there been any disaffection among the men at any time?—Occasionally, on enquiring into it, especially with the present manager, who is a very good one; I find that the chief cause of complaint has been that men of a mature age do not earn so much wages as they used to do when they were younger, and when they have accidentally what is called a bad bargain.

14,155. But there is no just cause of complaint as far as you know?—The complaints have always been greatly exaggerated; on examining into the matter and taking the rate of wages I have found by the books of the company that the wages have been 2*s.* or 3*s.* higher than have been represented by the men.

14,156. To what extent are the wages higher than those of the agricultural labourers of the district?—They earn 18*s.* a week, the work is constant; agricultural wages are higher in summer and lower in winter.

14,157. Should you say that the men are healthy?—Mines always shorten human life; they are tolerably healthy; they are healthy as far as ventilation goes.

14,158. Do you think that the description of work underground even with good ventilation is likely to shorten life?—A doctor will tell you that it is certain to do so; you own investigations will give you a better answer than I can.

14,159. Are you aware of any cases of what is termed miners' disease with the miners in this locality?—I am not; there is none; asthma is necessarily produced from breathing bad air, and human life is first weakened and then shortened.

14,160. Is there any deduction from the men's wages towards the support of schools?—Nothing: and with regard to schools, the mining company have not contributed anything to schooling, which I think they ought to do. There is a parish school and a school which I have set up for very young children. I think that they will contribute to it, but they have not done so hitherto.

14,161. Many of the miners reside at a distance, do they not?—They do; I do not think it desirable that they should all live here, nor does the agent think so.

14,162. He thinks it better that they should not all be congregated together?—Not all; it will be seen that the valleys are very narrow and that there is very little convenience for their living.

14,163. Have you visited the shops of the mine?—Frequently. In the case of the last shop which was built, which some of the Commissioners I understand have gone to see, a portion of the expense was contributed by Mr. Howard and myself in order that

the young men might have a room for reading, and occasionally to be used as a school room.

14,164. Is there an evening class held at the mine?—There has not been, and for this reason; a few years ago all the washings of the mines were let to an undertaker who hired the boys, and the directors had no control over their employment, as many of them lived at a distance. They worked 13 and 14 hours a day in the summer months in order that they might go home to Keswick or Penrith on the Friday evenings; this of course left no time for their instruction, they were wearied with their labour and went to bed; and on this point Mr. Howard and I beg to call the attention of the Commissioners to the only system of overwork which we are aware of in the mines.

14,165. (*Mr Austin Bruce.*) You mean that connected with the washings?—Yes; boys of from 10 to 16 years of age are employed, and for a number of hours which it is apparent to anyone is beyond their strength.

14,166. (*Chairman.*) Is this in order that they may get back to the places where they reside?—It is; and as the miners go away on Friday afternoon, the boys, especially if they are the sons of those miners, are naturally perfectly ready to over-work on the other days that they may go home with their parents or friends.

14,167. And that is occasioned by the boys as well as their parents residing at so great a distance?—With regard to those boys who do live at a distance it is, but with regard to the boys who live in the immediate neighbourhood it is not necessary.

14,168. But if one set of boys are obliged to work long hours on account of their residing at such a distance, must not the others necessarily work the same length of time?—I believe you will find that the washing could be carried on by a portion of the boys working the proper hours for six days in the week; the other portion would have to work longer hours to make up their work.

14,169. Are the workings of the mine carried on with regard to ventilation and other means so as not to be injurious to the men?—The management of the mine has been gradually improving. With regard to ventilation it is very good, and I will go on with some remarks on the management of the mine. Mr. Howard and I have recently employed a practical miner to give us reports as to the working of the mine; the one whom we employed was Mr. William Barrett, he has made very valuable suggestions as to the working of the mine, which I need not go into. The company have adopted them, and so satisfied are they with his recommendations that they have now employed him themselves as a supervisor of the mine; not that they are dissatisfied with their present manager, on the contrary, he, Mr. Phillips, has adopted immediately all the suggestions made by Mr. William Barrett. As to the working of the mine with regard to any effects on the public, some years ago there were no slime pits or very insufficient ones, and Mr. Howard and I pressed on the company to erect them, which after a certain delay they have done.

14,170. (*Mr. Austin Bruce.*) Will you be good enough to explain what slime pits are?—When the what is called bouse comes out of the mine, which consists of lead ore imbedded in stone, it is broken first by hand, and then by a crushing mill, and then the larger portions of it are washed by the boys of whom I have spoken. A considerable quantity of mud is produced, which is caught in shallow level places called pits, in which is a system of using the power of gravity to divide the mud from the heavier lead; that lead, which is as fine as dust, is retained in these pits, falling of course to the bottom of the pits. The sand being on the top is scraped off, and this is some of the most valuable produce of the lead. At the period of which I speak, from 10 to 7 years ago, these slime pits being very insufficient in number, a great portion of the lead was carried down into the lake of Ullswater, so much so that there was a film spread over the whole lake in calm weather, and all medical men say that that is most injurious, and occasionally when the miners have washed in that water, they have been more or less affected by it. This is now put an end to, and the mud which any one may see, which is thus carried in, consists almost entirely of sand, and therefore is not prejudicial to anything.

14,171. (*Chairman.*) This improved method is carried out at Greenside at present?—It is, and has been for some years. The plan of these slime pits was made by an agent who came from Alston Moor.

14,172. Do you suppose that in other lead mines, the same system is generally adopted?—I have no doubt that it is.

14,173. Is it carried out to such a full extent as to prevent what flows away becoming injurious to health?—In some mines I have no doubt that it was carried out long before it was adopted here, for they have been slow in adopting improvements.

14,174. (*Mr. Austin Bruce.*) You say that on the whole you think it a good thing that all the workmen should not live near the scene of their labours; do not you think it is an evil that a man should be separated from his family from Monday to Friday night?—I think I rather said that the agent did not think it necessary that all the miners should live here, and I added that the difficulty was that the valley here was so small, that it would be difficult to find houses for the men.

14,175. With respect to the employment of boys, would there be any difficulty in having gangs of boys just as you have gangs of workmen, working their eight hours per day?—I am not so well able to answer that question as a mining agent would be; it certainly would be prejudicial to the health of boys to work at night, and to work in eight hours shifts.

14,176. There might be two shifts a day, which would not involve, strictly speaking, work at night?—I should think that that would be a very good plan.

14,177. You have been I dare say acquainted with the mining population of other districts than this?—I have known something of the population of Alston Moor.

14,178. Have you had such a knowledge of the mining population of any other district, as would enable you to make any comparison between the relative health and condition of the miners here and of those elsewhere?—I have not.

14,179. Do you consider them on the whole as a healthy class of men?—I repeat a former answer, that the working underground, with the air which there is in a mine however well ventilated, makes men prematurely weak and old, and also shortens their lives.

14,180. I suppose that in your opinion mere absence from the light and the air of the surface, is itself an evil which cannot altogether be remedied by any amount of ventilation?—Certainly not, and the change from a temperature such as that of a mine to the cold and rain of winter, necessarily brings on either affections of the throat or rheumatic affections.

14,181. Are you aware whether there are any gases escaping from the lead, and mixing with the air in the mine?—There are not any, and in that my steward, who has been frequently in the mines, agrees with me.

14,182. With respect to the general intelligence and good conduct of the men, do you consider them an average population?—There I can speak to the purpose. The mining population both here, and also as I am informed at Alston, is much better behaved and more moral than it used to be.

14,183. Then a great improvement has taken place in them, they are better than they were formerly; are they equal to the rest of the population?—All occupations in which there is any difficulty call out among clever men more exercise of their intellect than mere farming operations, and that is the case with the miners.

PATTERDALE.

W. Marshall, Esq., M.P.

4 Oct. 1862.

14,184. Do they show a desire to have their children well educated ?—Yes, they do.

14,185. Do they show much eagerness about it as in Scotland ?—Moderately so.

14,186. What proportion of the whole mining population resides in the neighbourhood of the mines ?—The steward tells me between half and a third.

14,187. So that you would only have to provide education for the children of that portion of the workmen ?—Just so.

The witness withdrew.

Adjourned to Monday next, at Alston.

ALSTON.

Monday, 6th October 1862.

PRESENT :

The Right Hon. Lord KINNAIRD, K.T.
NICHOLAS KENDALL, Esq., M.P.
JOHN ST. AUBYN, Esq., M.P.
RICHARD DAVEY, Esq., M.P.
P. H. HOLLAND, Esq.

The Right Hon. Lord KINNAIRD, K.T., in the Chair.

Mr. TINNISWOOD MILLICAN examined.

ALSTON.

Mr. T. Millican.

6 Oct. 1862.

14,188. (*Chairman.*) Are you the agent or manager of any mines in this district ?—I am the district agent for the Lead Company, and Mr. Watson is the mining agent. I have the outdoor department.

14,189. What are the names of the mines which are under your charge ?—There is Long Cleugh and Small Cleugh, Middle Cleugh and Cow Hill, Ramp Gill, Scaleburn, Cow Hill, Gudam Gill, Hanging Shaw, Carrs Bridge, Brown Gill, Tynd Bottom, Hundy, and Fletcheras.

14,190. Are the royalties under the charge of one person ?—They are; they all belong to Greenwich Hospital.

14,191. Do the men enter all these mines from the Horse level, or do any enter from the shaft ? — Some enter from the shaft.

14,192. Which is the largest of these workings where most men are employed ?—Long Clough.

14,193. Do you know how many men altogether the London Lead Company have in their employment in this district ?—They have about 330 I believe at present ; sometimes we have 340.

14,194. Are those all miners ?—Yes.

14,195. Are they all working underground ?—Yes; the 330 are pickmen working underground.

14,196. Whereabout is Long Clough ?—It is about half a mile beyond Nenthead, further on the south.

14,197. Is it near any town or village?—It is about half a mile from Nenthead.

14,198. Is it in the valley ?—Yes ; it is in the valley.

14,199. How do you enter it ?—We enter it by the level ; the underground level.

14,200. What are the principal operations carried on in that mine ?—Principally blasting.

14,201. Are they sinking shafts or driving drifts ?—They are driving drifts. First, we drive a level ; we open up by driving a level 6½ feet by 4½ feet ; then we blast it ; and then after that, when we get as large a place as we want, we put in a stone arch.

14,202. Is that cheaper than wood ?—Yes ; and it is more lasting, and it makes a firmer job of it.

14,203. Do you know what the comparative expense of the two modes is at first ?—I should think that there is somewhere about 10*s.* a fathom difference.

14,204. Do you mean that the stone is 10*s.* a fathom dearer than the wood ?—10*s.* a fathom cheaper; when we can get stones at 8*s.* per fathom, and have easy access to the place we wish to arch, the stone answers the best.

14,205. In the first construction, is it cheaper ?—Yes ; in a place like this where we drive a level and cut it down about 10 feet, and we keep the refuse to put upon the arch, and sometimes require more to be brought from some other place in the mine to keep the working more secure.

14,206. You get rid of the refuse in that way ?—Yes, as much as we can in that way, and it keeps the mines more secure.

14,207. The men enter by the driving ways into the mine ?—Yes.

14,208. For what number of fathoms is the drift carried ?—About a mile, as near as I can tell you in this mine where the workings are.

14,209. In that distance are there any shafts going to the surface ?— Yes ; there are two shafts, and several rises from the low level, and some from the high level for circulation, &c.

14,210. At the end of the mine is it opened up into another working ?—Into another level communicating with the foremost shaft.

14,211. Is there no special ventilation in that distance ?—Several communications, as stated above,

14,212. Do the men go in waggons to their work ?—Generally.

14,213. Are there waggons employed to take their tools in ?—Some of the men ride in waggons along with the tools occasionally, and the others push forward the waggons.

14,214. You say that that is not general throughout the country ?—It is not so.

14,215. Where it is not so the men have to carry their tools ?—Yes.

14,216. When you are getting to the end of a level do you drive below or above this horse level ?—We generally work above the horse level, and we still aim at getting our horse level in as low as we can, we find that of advantage, it answers as a drain, and the work comes better and cheaper.

14,217. Are you liable, from the nature of the soil, to crushes ?—Sometimes.

14,218. Have any accidents occurred from that ?—Occasionally.

14,219. Do you use plenty of timber to shore up with ?—Yes ; we give the men the choice of what timber they think proper, in the wood yard ; and an opportunity to choose the best timber.

14,220. Do they put it up themselves ?—Yes, generally.

14,221. Are they supplied with the timber free of expense ?—Yes.

14,222. Does it rest with the men or with the manager to say where timber is required to be put up ?—Men ; we let them judge for themselves ; sometimes we press it on them, and think that they ought to have more. With a mine that requires much timber, it is our consideration whether it will pay us to let the men work that mine or not ; sometimes it will cost us more than it ought, and it will not pay, and in fact then we do not allow them.

14,223. Therefore, if the ground is of such a character as to require a good deal of timber you would probably abandon it ?—When we allow them to work

they are supplied with as much timber as they think necessary.

14,224. Is that abandonment of a mine of frequent occurrence or not?—No, it occurs very seldom.

14,225. Is the timber periodically inspected by any one in order that they may see it is properly put up? Yes, it is periodically inspected by the overmen and the agents.

14,226. Do they report to any one as to its efficiency or inefficiency?—No, they do not, but they see that it is done in the way that it should be done.

14,227. Do the men descend into the mines by means of cages?—No, we have none, we have very little of that kind of work now; what we call shafts or sumpts; formerly this country was wrought a great deal in that way in winzes and shafts; we find it a great advantage if we can get a level in, it answers for a drain.

14,228. When you are inside you must have winzes or shafts to get at a lower or higher level?—Occasionally, but very little.

14,229. Suppose that a vein extends upwards, how do you reach it?—Then we rise up.

14,230. By ladders?—Yes.

14,231. When you rise up in that way, or sink down, how do you manage for ventilation?—We have hand airing machines, and generally blast pressure down another shaft.

14,232. Will you be good enough to give a description of the water-blast that is used?—The water-blast is a pressure blast with a small hole near the end of the lowest pipe, and we sometimes attach an airing machine to it.

14,233. Which do you think answers the best?—I can scarcely tell; it is a good while since I have seen them much tried. Mr. Watson will give you more particulars about the blast.

14,234. Are the men who are working in these mines healthy?—We do not consider mining a healthy thing at the best.

14,235. How are the miners affected?—In their breathing.

14,236. What in your opinion is that occasioned by?—I should think it would be from the smoke and dust, the dust gets into their lungs.

14,237. Is there a great deal of dust in these mines?—Yes, in some of the dry mines.

14,238. Is it small dust?—Yes; we consider the wet mines the more healthy, generally.

14,239. But several of these mines are dry, are they not?—Yes, several.

14,240. How long is the powder smoke, after blasting, in clearing away?—It just depends upon what kind of air it is, and what kind of current there is.

14,241. Are there any men whom you could point out who are at all affected in their breathing?—We have some at Nenthead and Garrigill.

14,242. Is there any doctor who is connected with the mine?—Yes, we have a doctor; the lead company find a doctor for all their workmen free.

14,243. What do the men pay a month in the shape of club money or for the doctor?—They pay nothing to the doctor, but they pay 30*s.* a year to the fund.

14,244. Is it a fund for affording relief in case of sickness or of accident?—It is for sickness or accidents either.

14,245. Is there a separate account kept of that fund?—Yes.

14,246. What is a man allowed when he is out of employment on account of sickness?—He is allowed 7*s.* a week.

14,247. Is the fund sufficient to meet all claims that are made upon it?—Yes.

14,248. Do you happen to know what balance there is in hand?—It does not strike me at present.

14,249. Are there any Odd Fellows clubs here?—Yes, there are some at Alston, but there are none at Nenthead. Some of the lead company's miners are in some of the clubs.

14,250. Do the men subscribe to them as well as to the mine fund?—Yes.

14,251. Are they all obliged to subscribe to the mine club?—It is a condition, all who wish to become regular workmen.

14,252. What is the youngest age at which boys work underground?—14 I believe; we allow them to go in, but not until they are about 18 years of age, to work regularly; they wash in the summer on the surface, and we let them go underground in the winter at 14 years of age, when they cannot wash outside.

14,253. They work underground in the winter?—Yes, they just help to get away the work, they work in the different partnerships: we allow them to go along with the men, so that they take care of them; their work is to wheel to certain parts, and to separate the work, and teach them how to strike and beat.

14,254. Do the men work double or single-handed?—Double-handed generally; very few single-handed.

14,255. I suppose that a miner may take his son down, although he is younger than the age you have mentioned?—No, several do not go in till they are 20.

14,256. Are there any washing floors at your mines?—Yes, at all the mines.

12,257. Do any females work there?—No, we have not one; formerly we had some, but the company discontinued to employ them 40 years ago.

14,258. Do men now do that work?—Yes.

14,259. Do they work under cover?—Yes, in some places, not in all; we have some of the washing places covered.

14,260. Do the men reside near the mines, or at a distance from them?—Generally, I think, they are near our mines. At Nenthead they are not far off, about $\frac{1}{6}$ of a mile perhaps, and some of them three quarters.

14,261. Do the miners change their clothes when they come out of the mine?—Not until they go home.

14,262. Have they no place to change in?—No.

14,263. In wet mines, do not the miners get wet?—They go home to change them; they go home in their wet clothes; but we allow them, when they have worked in a very wet place, a waterproof suit to put on.

14,264. There are, I believe, some very wet places in the mine referred to?—Yes.

14,265. What allowance of candles do you make to the miners?—They use what they require.

14,266. What do they pay per pound for the candles?—We pay about 8*s.* I believe it was 7*s.* 10*d.* a dozen last year.

14,267. Are the men charged the same price as you pay for them?—No, we take an average of the price.

14,268. Do you mean an average over 12 months?—We have different districts belonging to the lead company; there is the Teesdale mining district, and the Westmoreland mining district, and we strike an average of the rates, and charge the men accordingly.

14,269. At that average price the men are supplied with candles?—Yes, on that average price we fix the rate at what we think they ought to pay.

14,270. How often is that average struck?—Once a year.

14,271. Do they pay for powder in a similar way?—Yes.

14,272. Do they pay also for sharpening their tools?—No, they buy their new tools first; we supply them and charge them so much for them.

14,273. Then the tools belong to the miners after that?—Yes.

14,274. If they should happen to leave the mine,

ALSTON.

Mr. T. Millican.

6 Oct. 1862.

would they take them with them?—No, they return them, and we give what they are worth.

14,275. Are they weighed then?—Yes.

14,276. Is no reduction made for wear and tear?—Yes, they generally get worse; we often repair the tools for the men, but we do not charge them for that.

14,277. Have any accidents occurred from blasting in your mines?—Sometimes.

14,278. Do the men use the patent safety fuze or a straw?—The men do not like the fuze, it has such a bad smell. We have several times got it for them, and wished them to use it, but they do not like the smell of it at all; they prefer the squib.

14,279. Have they any other objection to the patent fuze?—I do not recollect any other.

14,280. How are the accidents from blasting occasioned?—In charging the holes generally, it strikes fire.

14,281. Do you use iron tamping rods?—No, we use copper, we think that they are safer.

14,282. Do you mean iron coppered over?—Yes.

14,283. How far up does the copper reach?—I should think perhaps half an inch or three quarters.

14,284. Are the prickers made of iron or of copper?—Of copper.

14,285. If the tamping rod is of brass and they only use that how would an accident happen then?—Sometimes there may be some unsound holes, and they may hit a corner with the driver and strike fire unexpectedly.

14,286. (*Mr. St. Aubyn.*) Does the nature of your occupation bring you much into personal contact with the miners?—Yes, I am constantly moving about, and meeting with them; they have to attend our reckonings, and I am in the office when we reckon with them generally.

14,287. You have stated that they begin to work generally about the age of 14, have you any knowledge of the average age at which they leave off work?—I cannot speak to that.

14,288. Do the men work in your mines until they reach what you would call a good old age?—They work some of them up to the age of 55 and even to 60, but that is a rare case.

14,289. It is rare is it to find a man working in the mines at the age of 60?—Yes.

14,290. Do you think that they leave off working before that age from being incapacitated by the labour they have undergone in the mines?—There is no doubt of it.

14,291. Do you ever hear the miners complain of the nature of their work?—That sometimes happens.

14,292. To what cause have you heard them ascribe their failing condition?—Sometimes the mines are not so good for air as we would like to see them.

14,293. Is there bad ventilation?—Yes, on this account; sometimes when we are holing to a place we have to change the men and not to let it depend altogether on one partnership. We wish to change them and let every person have a share, and in cases of that kind it is unavoidable; as soon as we can get them ventilated we do so.

14,294. That is one cause?—Yes.

14,295. Is there any other cause that you have heard the miners mention?—No; it is the want of ventilation and the dusty places, that is what they complain of; when we happen to have anything of that kind it is unavoidable, there will always be some places of that kind in mining.

14,296. Can you give the commissioners any information as to the average number of men or thereabouts who are under the doctor's hands at a time; for example, suppose you have 100 men working how, many of those would probably be under the doctor's hands?—We have, say, 330 or 340 pickmen, sometimes we have fewer and sometimes more; I should think that 20 would be as many of those that we have at present, or 15, as are under the doctor's hands, but I think we scarce have that number.

14,297. Are they under the doctor's hands from causes connected with their work?—There are other causes besides that.

14,298. Can you at all specify what proportion of the causes are connected with their work?—I cannot speak to that at all; I think there are about 10 or 15 under the doctor's hands, from various causes, besides being affected by the mines.

14,299. Can you state what proportion of that number are suffering from causes connected with their work?—I cannot.

14,300. (*Mr. Davey.*) What is the general health of your workmen?—It is about like others parts I believe.

14,301. Do they suffer more or less than the agricultural labourers?—They are not so healthy as the agricultural labourers.

14,302. I believe your men have small farms or small holdings on which they work and cultivate them?—Yes; and it does them good a little working at the surface.

14,303. Do men come from any other districts to work in your mines?—Not many.

14,304. Do you perceive any difference in the health which those men enjoy as compared with those of your own immediate neighbourhood?—No.

14,305. How much lead per month, or annually, do your mines produce?—Last year we had somewhere about 6,000 bings, 8 cwt. is one bing.

14,306. Do you smelt it?—Yes, the whole of it; we smelt it ourselves near the mines.

14,307. You stated just now that you occasionally heard complaints; to whom ought they to be made, to you or to the manager underground?—The complaints are generally made at the quarterly review when we have our bargains made. We have them thrice in the year, and then if they wish to have a place changed that does not suit their health we contrive to change it.

14,308. Are you generally present at these quarterly takings?—Generally.

14,309. Not always?—Yes, always when I am in health. But our superintendent, Mr. Banebridge, is present always, and he lets the bargains.

14,310. The complaints would be virtually made to him?—Yes.

14,311. What is the manner in which you let your bargains?—We have what are called viewing agents, and they all go into the mines and take a view, and make their statements of what they think a place ought to be worked at per fathom. They give that to our superintendent, and he fixes the rate.

14,312. The miners work within a certain limit; you fix the price, and they have the opportunity of changing a place if they like?—Just so. We have three districts, and when the mines are viewed the agents come from the other two districts, it keeps us clear from having any corruption amongst us. And we all give independent opinions, so that we cannot cheat anyone.

14,313. (*Mr. Kendall.*) If I understand you rightly you are a district agent; your business is not to go underground?—No; I have not been underground for 14 years, excepting two or three times.

14,314. Do you look after the interests of Greenwich Hospital alone?—No; I have nothing to do with that. I am agent for the lead company.

14,315. Do any of the arches of which you have spoken ever give way?—Not often.

14,316. Have you ever known some of them to give way?—Occasionally.

14,317. With regard to the woodwork, you say that sometimes it becomes a question whether a working should be continued, although the ore may not be scarce, in consequence of the very great expense to be incurred for timbering, and that sometimes you resolve to abandon it?—Yes.

14,318. Just prior to abandoning a working do the miners become careless, which makes it necessary to be very cautious, or, in other words, do they use less timber than they ought to do?—We look to that so as to get them to use plenty of timber.

14,319. They will, I presume, have to bear the cost of putting up the timber ?—Yes; but we let them have what timber they have a mind to have.

14,320. But is there anyone who superintends that matter in order to see and to report ?—They view the mines generally once or twice a week, the overmen do.

14,321. Would it not be advisable if danger sometimes does arise to have not only one person to superintend but also to report upon the dangerous places ?—I do not think that is necessary. There is an overman in the mines, and Mr. Watson is the agent; it it is his place to see that the overman does what is right.

14,322. There are some dry mines and some wet mines; have you ever had occasion to observe whether the miners are most healthy in the wet mines or in the dry mines ?—In the wet mines.

14,323. You are of opinion, I suppose, that the dust is more injurious than the damp ?—Yes, I am.

14,324. From what does the dust arise, from the boring ?—There is the boring and the blasting, and they cause a deal of soft dust to fly about.

14,325. Is it a sort of impalpable dust that lies about the side also ?—Yes; but we can see it.

14,326. Do the miners put anything over their mouths like gauze to keep the dust away ?—Seldom. I have seen them have it, but only a few.

14,327. In the wet mines do you lend the miners waterproof clothes sometimes ?—Yes.

14,328. Do they work in them underground ?—Yes.

14,329. Must not the perspiration while wearing the waterproof clothes be very intense ?—It is a very rare case. It is so sometimes in very wet places, just for a time.

14,330. When they come to the surface do they leave their waterproof garments there ?—They leave them inside generally till they go back again.

14,331. Do they walk home ?—Yes.

14,332. Have you any sleeping places on the mines?—Very little of that; we have very few houses of that kind.

14,333. Have you any ?—Yes, there are three at our place, but they are very small places.

14,334. How many men can sleep in one place ?—There will be 12 men in our largest place; the Teesdale mines have more lodging houses, and good ones there. Our men live near their homes here, but in Teesdale the mines are at a greater distance from their houses.

14,335. (*Mr. Holland.*) About what age does the miners' complaint come on ?—That depends a good deal upon the individual.

14,336. But, generally speaking, about what age should you say, 40 ?—Yes, I should think so.

14,337. Do many men reach the age of 45 without it ?—I should think that they would be affected mostly.

14,338. You mean, I suppose, that very few of them of that age would be without it ?—Not many. I think that the greater part of them would be affected before they reached 45.

14,339. That is pretty generally so, is it ?—Yes.

14,340. Do not a very large proportion of those who get above 45 die of it ?—Yes, if they get above 45.

14;341. Do they die of it chiefly?—Yes.

14,342. Is it much the same complaint in them all, shortness of breath and spitting ?—Yes, I should think so.

14,343. Do they appear to suffer much pain from it ?—Sometimes they seem to suffer very little, just from shortness of breath, with no pain.

14,344. Do they become weak ?—Yes, generally.

14,345. And gradually waste away ?—Yes, but if they are kept quiet they have no pain.

14,346. At what age do you consider a miner an old man ?—We consider a miner an old man at 50 or upwards, 52 or 53.

14,347. Do you mean that when he reaches the age of 50 he is nearly done ?—Yes, he is nearly done then.

14,348. Does he look a great deal older than an agricultural labourer of the same age ?—Yes.

14,349. What difference should you say there was?—The cheeks of the agricultural labourer are far healthier in appearance.

14,350. I have been informed that an agricultural labourer of 60 looks as young as a miner of 50; is that correct ?—Yes, I think it is.

14,351. Do the same men continue for a long time working in the dry and in the wet levels, as the case may be, or do they frequently change ?—We leave it a good deal to their own choice.

14,352. Are the same men constantly changing ?—Occasionally.

14,353. As the same men would be exposed to the operation of both causes if they are constantly changing from the wet to the dry mines the effect would not be so evident upon their health ?—It is not so evident; we give them a choice of a dry mine or a wet mine.

14,354. Do the miners work for one month in a dry mine and the next month in a wet mine ?—It is generally once a quarter that we change them.

14,355. Does a man work for two or three years in a dry mine or in a wet mine ?—Yes, he works more than that sometimes in one continued place.

14,356. Can you say whether or not the men who work for a long time in dry mines suffer more from these complaints than those who work in the wet mines ? Have you noticed that ?—Yes.

14,357. It happens but seldom, I suppose, that they do work only in one kind of mine ?—Some of them work a good deal in a sort of damp mine, and others work a long time in a dry mine. I remember some who worked in a dry mine and died sooner than they would have done had they been working in a wet mine, so far as I was capable of judging.

14,358. Are any of your mines so badly ventilated that it is difficult to keep a candle burning upright ?—I should think they are scarcely so bad as that, but it may be so for a day or two.

The witness withdrew.

Mr. THOMAS WATSON examined.

14,359. (*Chairman.*) You are the underground agent for the lead company's mines ?—Yes.

14,360. Have you charge of the whole of them ?—Yes, in the Alston district.

14,361. What is the longest distance that any drift has been driven from the day ?—I cannot say exactly the distance from the day; we generally call them levels. I should think that the longest is about two miles.

14,362. In which mine would that be ?—In Caple Cleugh mine.

14,363. Does that communicate with any old workings ? — Yes, it communicates with the Garrigill mines, and it communicates with the Long Cleugh mine as well.

14,364. In the course of that distance are there shafts going to the surface ?—Yes.

14,365. Do you know about how many there are ?—There are a great number of them closed now, the old shafts; and the current passes right through the mountain on to the Garrigill side, a distance of fully three miles.

14,366. You say that the shafts from the surface are closed ?—Yes, a number of them, but we have about half-a-dozen that are open.

ALSTON.

Mr. T. Watson.

6 Oct. 1862.

14,367. Do any of these act as up-cast shafts ?—Yes.

14,368. Is one constantly an up-cast shaft ?—Yes.

14,369. Where is that situated ; is it high or low down ?—It is just about the summit of the fell ; it is the moss shaft.

14,370. That is always an up-cast shaft ?—Yes.

14,371. Does the powder smoke always make its escape in that way ?—Yes.

14,372. Do you employ any artificial means for making that an up-cast shaft ?—No, it is just natural.

14,373. How far have you ever driven from either of these shafts ?—It is an old shaft ; the fact is that it is just situated about half way down the summit of the fell from the Nenthead side and the Garrigill side ; but there have been several openings, and there are openings connected with the old works both on the west and on the east side of that shaft.

14,374. Have you ever driven any level where, when the men have been working, the candle would not burn upright ?—Sometimes when a place has yielded a considerable quantity of foul air we have met with it in that way, in the great limestone there are a great many crevices ; it sometimes happens when the weather is going to be bad, that out of these crevices the foul air is blown.

14,375. The foul air you think comes out of the crevices ?—Yes, I think there is little doubt about that ; I think at least that it comes from there, there is no opening from the surface or from any other quarter that we are aware of ; it just comes in from some place lodged in the rock ; at what distance it may be from where we are working we cannot tell.

14,376. What do you consider to be foul air ?—We call it foul or bad air. We commonly use the words foul air for bad air or impure air ; but, perhaps, strictly speaking, it is carbonic acid gas that comes out of the limestone.

14,377. How do you discover it ?—It nips the candle out.

14,378. Do the men feel it before the candle is nipped out ?—Yes, they feel a difficulty in breathing, and the candle burns dimly. If the working is not sufficiently impregnated with gas so as to extinguish the light, then in order to test the quantity that is coming into the working they apply a candle to a crevice, and then if it be powerful it at once extinguishes the light as it comes out of the crevice. We have had hundreds of instances of that kind in the great limestone. And there is another thing, what comes out of the crevice always takes the bottom ; it flows at the bottom, and the candle is extinguished there when it would burn quite easily at the roof.

14,379. (*Mr. Kendall.*) Will it flow without mingling with the other air ?—That depends upon how far it is to the point of ventilation.

14,380. What is the greatest distance, or have you ever noticed that ?—Perhaps 100 fathoms in some instances.

14,381. (*Chairman.*) When you find this to be the case do the men leave off their work ?—Sometimes they do and sometimes they do not if they think that they can manage ; it is just left to their own judgment for the most part ; but in many instances when we have gone to view them, and we have found the air to be bad in that way, we have advised them to leave off.

14,382. Although the men were working on ?—Yes.

14,383. Do you find that by taking the men off for a certain time the air improves, or do you use any artificial means for the purpose of ventilation ?—There is a certain change in the atmosphere when these crevices supply none of this sort of thing into the working ; there seems to be a current in a contrary direction, so that it either confines it or takes it away in the other direction.

14,384. The men in that case must wait for a change of weather before they can go back to their work again ?—Yes, unless they go back through the level in the same state.

14,385. How long have you ever kept the men idle for this reason ?—Very seldom for above a day or two.

14,386. Do you never in such a case apply any means to get rid of this bad air ?—Not when it is coming out of the rock in that way. We sometimes apply a more powerful ventilating apparatus. If a place supplies a great deal then we adopt means just according to the circumstances, that is, we set on more ventilating power.

14,387. Do you sometimes find that although there is plenty of air above and the atmosphere is clear, the carbonic acid gas puts the candle out ?—Yes. Sometimes when we have had an old sumpt when all is good at the random of the level, three feet below the level it is filled with that sort of vapour, and life would soon become extinct if you were to go down.

14,388. What means have you adopted besides removing the men from their work, to supply fresh air ?—We have used pressure blasts, and hand-airing machines ; we have both small water-wheels and pressure blasts, and hand-airing machines, and trap-doors.

14,389. Is the air taken in by iron pipes ?—Yes.

14,390. Do you prefer iron pipes to wooden ones ?—Yes ; they last longer.

14,391. Is there any other reason why you prefer them ?—No.

14,392. Do you think that the air is better conveyed in an iron pipe than in a wooden one ?—Not at all ; we have sometimes conveyed it in that way in wooden boxes.

14,393. Do you find any difference in the air by so conveying it ?—Not the least when the boxes are made as they ought to be, but if the men are rising a long way, boxes are a great deal easier to the men ; the iron pipe is a very heavy thing to take up.

14,394. That is when they are working at a rise ?—Yes ; and we frequently just adopt a wooden box for the sake of giving the men ease.

14,395. Do you apply the wooden box at the end of an iron pipe that is running along the level ?—Yes ; we fix it in.

14,396. Have you had any accidents from blasting ?—Very seldom.

14,397. When any accident does occur what do you think it arises from ?—It sometimes arises from this : In the great limestone there are several crevices, and in putting the powder into the holes, which are bored at the trials, some of the powder sometimes gets lodged in those crevices, and it may be that when the men are charging it, the iron on the driver, as we call it, sometimes catches the edge of the crevice and strikes fire.

14,398. That is at a point above where the copper is put on ?—Just so.

14,399. The driver is copper pointed ?—Yes, on the mouth of the driver.

14,400. What is the reason that the men do not like the patent fuze ?—Just because of the disagreeable smell.

14,401. Is more smoke caused by it ?—Yes, I think there is. I do not think there is any more from the powder, but there is from the fuze itself, and that is disagreeable.

14,402. Is there any other reason why they should not be used arising from the nature of the work ?—I do not know that there is. There is the habit of the men ; they have always been accustomed to their own mode of charging their holes.

14,403. Do they take the powder down into the mines with them in bags ?—They used to take it down in bags, but we do not allow them to do so now.

14,404. Do you let the works quarterly ?—Yes.

14,405. Are they called pairs or shifts of men ?—They are called partnerships.

14,406. How many are there in a partnership generally ?—Four is the most common number ; but we have them consisting of from two to eight.

14,407. What are the hours during which they work ?—Eight hours per day.

14,408. Are there shifts ?—Yes ; five eight-hour shifts for a week.

14,409. And is there another shift in the second eight hours ?—Yes. When there is a great partnership and they cannot get all on conveniently together, if the place is, for instance, a level, and if there is a quantity of work that it has been inconvenient to get away, then they just go on as it seems best.

14,410. Otherwise the others work eight hours in the course of the day ?—Just so.

14,411. Do they work at all at night ?—Not when they can all get on in the day.

14,412. What are the highest and the lowest wages that miners can earn in these mines ?—Taking it for a quarter it sometimes happens that some of these partnerships speculate, and for three months they may make nothing, just for a trial ; and in the next three months they perhaps may make 3*l.* a week.

14,413. During the first three months when they make nothing are they allowed anything ?—We make them advances if the viewing party considers that the place is worth a trial and that the men are justified in making such a speculation, and if it lasts 12 months they continue to them their advances.

14,414. What are the allowances that are made to them under such circumstances ?—2*l.* 4*s.* per month to each man.

14,415. Do the allowances take place regularly ?—Yes; when the young men go in we generally give them 35*s.* a month during the first quarter; and from the end of the first quarter till they are 21 years of age, or until they are 20, we generally give them 2*l.* a month, from the age of 20 to 21, and 2*l.* 4*s.* for two out of every three months, and 2*l.* the third month ; that is our general way ; of course there are exceptions ; some men are working with their friends.

14,416. What do the miners generally pay per pound for candles ?—We always deduct the price of candles annually, when we settle the annual accounts.

14,417. The charge for candles and powder is all settled annually ?—Yes.

14,418. I believe the miners do not lodge on the mine ?—Very few of them ; they are just the exception ; but they generally live in the neighbourhood of the mines.

14,419. Do the men go into the mines in waggons, or do they walk into them ?—We have small hand waggons, and each partnership has one of those ; they divide the distance into what they call stages, and each man takes a stage, and they carry their tools, powder, and candles and other things in that way.

14,420. (*Mr. St. Aubyn.*) What, in your opinion, are the principal causes of the unhealthiness of the miners ?—I think that part of it arises from the dust that comes from the rocks similar to what a stone mason is exposed to from the stone he is building with, or when hewing such rock ; very likely another part of it comes from the smoke that arises from the gunpowder, and in addition to that another cause will be the impure atmosphere, because it cannot be considered that a mine can be ventilated like the surface ; no mine is in that way, and then there is this carbonic acid gas that flows out of the rock as well, and all these added together make a considerable total.

14,421. Then the want of ventilation, speaking generally, is the principal cause of their unhealthiness ?—Just so.

14,422. Do you believe that the best means are now adopted for the purpose of ventilating your mines ?—They are with us ; we do everything that we possibly can.

14,423. Do you mean by that that you do everything that you possibly can, consistently with carrying on the mines, with reference to the expense ?—No ; I mean with proper regard to the men's health ; suppose, for example, that a mine is a losing bargain we would just do the same thing ; it is not a question of profit and loss when the men's health is concerned, we set the loss aside altogether.

14,424. Do you mean that you would work a mine at a loss in order to adopt such means as would preserve the men's health ?—No, not for any great length of time ; but suppose we are making a trial, and we see that there are little hopes of success, and, in order to keep down the expenditure, we were to punish the men, and not ventilate properly, we should consider that decidedly wrong. If a place could not be worked properly, with a due regard to the men's health, we should at once abandon it on humane principles.

14,425. Can the present system of ventilation, as employed in these mines, be improved ?—We do not think it can.

14,426. With regard to the safety fuze, you say that the men dislike it ?—They do.

14,427. Do you consider that it is more safe than the other plan ?—We do not think it is, except in a wet place ; we generally use it in sumpting in wet places, but that is the exception.

14,428. Do you leave it to the option of the miners to use the safety fuze, or not, as they like in wet places ?—Yes.

14,429. And yet you consider it more safe in wet places than the other place ?—It is more safe in this way, not on account of accidents, but there is a greater probability of a hole not missing fire, as we say, or not going off, should the least quantity of water get into the hole in the way that they are commonly charged, then of course that will damp the powder, and it will not go off.

14,430. You mean that the safety fuze is not so liable to damp ?—Just so.

14,431. You do not think that it is less dangerous ?—No, but it is not so liable to damp.

14,432. When the fuze misses fire, and the hole has to be worked out again, then there is danger, is there not ?—Yes ; there is.

14,433. Do you consider that the danger is more or less with the safety fuze than with the other ?—It is more ; because the hole would have to be bored out again.

14,434. Do you consider that the safety fuze is less dangerous to human life than the other, or more so ?—I do not suppose there is much difference in that way ; the only danger that I spoke about was stopping the work.

14,435. You mean that it is less effective ?—Just so.

14,436. Will you describe to the Commissioners how the blasting is done ?—I presume that the drilling of the hole is well understood when the gunpower is deposited in it ; we have then what we call a pricker, with a sharp point made of copper, and it has a round eye to put in the article with, and to bring it out after we have got it fixed ; then we put this pricker into the hole, and we have a driver that is in that shape (*describing it*), and we put that under the pricker in that way (*describing the same*), and put the stemming down on the top, and that makes it all hard round the pricker.

14,437. What material do you stem with ?—We stem with shale commonly ; when the hole is properly filled up with the stemming, we just draw out the pricker, and put what we call a squib into the place ; but coal miners for the most part put in a straw.

14,438. (*Chairman*). Who makes the squib ?—The men make it ; it is a roll of paper with powder inside.

14,439. (*Mr. Davey*). You stated just now that it sometimes happened that the men took a bargain and got nothing by it, is there no competition in that way ?—No, not in letting a bargain.

14,440. One man may not say, "I will do it for "less ?"—Never, the price is fixed. It sometimes happens that one partnership will not take it at that price ; they sometimes think it too little, and sometimes the men are not suitable, and sometimes one thing and sometimes another.

14,441. Then another partnership will take it ?—Yes, but there is no competition in the price, one

ALSTON.

Mr. T. Watson.

6 Oct. 1862.

man never takes it for less money than another man would take it for; the price applies equally alike to all the men, good and bad.

14,442. (*Mr. Holland.*) They chose their own takes?—Yes.

14,443. (*Mr. Davey*). What are the average wages in your mines?—A good man, taking it for 12 months, would make from 18*s.* to 20*s.* a week.

14,444. During a year?—Yes.

14,445. You stated a short time back that you had one level that was driven for two miles; is there any level driven from that that is any considerable distance from a communication with the surface?—Not in that mine.

14,446. Do you use any ladders?—Yes.

14,447. How are they made?—They are made just like what is called in this country common stay ladders, they are just cut out and tenoned in; they are merely pieces of wood put in, and they are tenoned in.

14,448. What is the greatest depth from which the men have to climb?—About 30 fathoms; that is in the whole district, including Garrigill and Nenthead.

14,449. That is the greatest depth at any one place?—Yes, 30 fathoms. It is far more from the surface right down to the lowest level.

14,450. Is there a continuous ladder for the 30 fathoms?—No, separate ladders about 12 feet long, with landings at the foot of each.

14,451. What is the inclination?—That altogether depends upon the hade of the vein; in this place it is, perhaps, one foot in six.

14,452. Have you any stages in the course of the 30 fathoms?—Yes; we have a drift or cross-cut about half way.

14,453. What size is the shaft?—At that point it is 8 feet long and 6 feet wide.

14,454. Is there any partition between the ladder and the working?—Yes.

14,455. What is the kind of space in which the ladders are placed?—We generally make them 3 feet 6 long.

14,456. Are they square?—They are 3 feet 6 long and 4 feet 6 in width.

14,457. I think you said that the ladders were placed according to the inclination of the lode?—Yes, that is it.

14,458. Have you any perpendicular shafts?—We have a few, but not a great many.

14,459. Do you observe any difference in those men who have to climb those ladders and the other men who have not?—Yes, of course it is very exhausting to climb ladders; but it is so little that the young men do not find a great deal of inconvenience from it, the old men, whose breathing has become bad, are put to the greatest inconvenience.

14,460. You do not place old men, I presume, in that position?—Not generally so.

14,461. Do you give them lighter work?—Just so.

14,462. Do you not think that if they had changing houses close to the pit, they would be a great benefit to the men who work in cold and wet places?—Yes; when the men are living at a great distance from the mines, but in Nenthead the men are close to their own homes, and they have their families, their wives or daughters, just as the case may be, being their housekeepers, and they have their clothes already warmed when they go home in order to change at once.

14,463. I understood that they did not change?—Not at the mine, but when they get home they change at once, and put on warm clothing. We have some waterproof clothes with which we supply the men when they go into wet places.

14,464. Are they able to work in waterproof clothes?—Yes, what we call waterproof clothes the greatest quantity of the water goes out, they are similar to what keelmen use on the rivers.

14,465. Would not the perspiration be very oppressive to the miners?—That is one thing that sets them against them very much; the men that wear them can never stand long shifts, for they are very exhausting.

14,466. Are these air cracks frequently found in your levels?—Yes, but it is chiefly in the great limestone, in the mountain limestone, not so much in the other strata.

14,467. How often do you inspect the workings?—I am going almost every day to the different parts.

14,468. It has been mentioned that a certain portion of the workings requires a great deal of timber?—Yes.

14,469. Is that a matter that is left to the men or to the agents to inspect it?—The agents inspect it. I have prepared a paper, showing the cost per fathom of timbering the mines, and the cost per fathom of arching the mines, which I will hand in.

The same was handed in as follows:—

The Lead Company's mines, Nenthead.

Cost, &c. per fathom of timbering the mines:—

	£	*s.*	*d.*
To 9 pieces of larch timber 6 feet long, each containing $1\frac{1}{4}$ cubic feet, at 1*s.* 6*d.* per foot	0	16	$10\frac{1}{2}$
To 12 pieces of larch timber 6 feet long, each containing 3 superficial feet, at $1\frac{1}{2}$*d.* per foot	0	4	6
To carriage of timber from wood yard to the mines, 47 feet, at $\frac{1}{2}$*d.* per foot	0	1	$11\frac{1}{2}$
To carriage of timber into the mines, 6 waggons, at 4*d.* per waggon	0	2	0
To fixing timber, 2 days, at 3*s.* per day	0	6	0
To filling and drawing work produced in fixing timber, 3 waggons, at 8*d.* per waggon	0	2	0
Total cost per fathom	1	13	4

Cost, &c. per fathom of arching the mines:—

	£	*s.*	*d.*
To winning and leading stones to the mines, 1 fathom, at 8*s.* per fathom	0	8	0
To taking stones into the mines, 6 waggons, at 4*d.* per waggon	0	2	0
To walling and arching levels, 1 fathom, at 11*s.* per fathom	0	11	0
To filling and drawing work produced in fixing arch, 3 waggons, at 8*d.* per waggons	0	2	0
Total cost per fathom	1	3	0

THOMAS WATSON (Tees)

4th October 1862.

14,470. Are there any levels which are extended very far from the level you have spoken of, or extended to a great distance?—No, not what we call a great distance. We had one, and that was about some 60 fathoms from the air communication; but, of course, we had water there and ventilation. A fortnight ago we brought it nearer to it still, so that we are working in comparatively good air in that way. We have not a place in all the district where it is a long way from good air.

14,471. Before you made this communication had you good air or air in which the men could work comfortably?—They could work comfortably on the whole; but at the same time we considered it injurious for any length of time; the men had been working there and in that neighbourhood for the last two years and a half.

14,472. Now the defect is remedied?—Yes.

14,473. (*Mr. Holland.*) How near to the mine are

the dwellings of the miners ?—Three hundred yards or so, some of them.

14,474. So that they can get under shelter in a few minutes ?—Yes.

14,475. Do they come out of the mines very hot ? That altogether depends upon the nature of the work.

14,476. But are they very hot, generally speaking, when they come up ?—No.

14,477. Are they generally pretty cool ?—Yes.

14,478. They are not very wet with perspiration ? —No, and we have not much water.

14,479. Are their clothes wet with perspiration ? —Not to a very great extent, they generally take care of that.

14,480. What effect has the carbonic acid gas upon them, except to make them breathe badly ?—It makes them exceedingly bad in the head when they come out.

14,481. Like a very bad headache ?—It is a severe pain just as if you were nipped up in your head, and in addition to that you begin to feel as if you were almost intoxicated. Your head grows heavy, and you are like to fall when you come into good air. You feel as if you were intoxicated, but in a few minutes you come round again.

14,482. Do they feel cold ?—No.

14,483. Are they hot ?—Just about as usual ; there is never much difference that is perceptible.

14,484. Do they very soon recover themselves ?— Yes.

14,485. Are your lodes all in limestone ?—Yes, it is the chief stratum. We have that, but they are not, of course, all productive in that.

14,486. Are there lodes in the shale as well as in the limestone ?—Yes.

14,487. Does a lode cut several strata ?—Yes.

14,488. Do the crevices yield more carbonic acid gas when they are first cut then afterwards ?—For the most part they are original openings, and when it does come the current sweeps it away.

14,489. Have you noticed that the crevices yield less carbonic acid gas after they have been cut some time than they did when they were first cut ?—I cannot say that I have observed that.

14,490. Is it not likely that there may be an accumulation of carbonic acid gas in a crevice ?—I have not particularly observed that.

14,491. You have stated that the men worked eight hours a day ; is the mine idle during the other 16 hours of the 24 ?—Yes, and then all the smoke gets swept away, and the atmosphere is more pure for the next.

14,492. You seem to attribute a large portion of the disease to which the miners are subject to the dust they breathe ?—It is partly that.

14,493. Is that in your opinion the chief cause ?— Yes, it undoubtedly is, for there have been instances of individuals who had worked for a considerable length of time in this shale, and have then gone to some watering places, and have sometimes vomited what has been a collection of that dust.

14,494. Or coughed it up?—No, vomited; coughing is a common thing, but I mean vomiting ; it has gone down, and having been made sick ; there have been instances, of course they are rare, but I have known two or three where men have vomited up what was just like a collection of dust.

14,495. Would not a certain amount of ventilation carry away that dust ?—It can no more carry away the dust than you could carry away the dust from a stonemason who is hewing the stone.

14,496. Could not the dust be kept down by water, and keeping the holes wet ?—I do not know, but perhaps it might ; there is a great difficulty in it, and in addition to that it would make the place damp, and the men might be more subject to take cold.

14,497. Would it be very expensive to get water for such a purpose ?—It altogether depends upon circumstances.

14,498. Is there not water generally within easy reach in most mines ?—Yes, but it would be difficult perhaps to get it so as to work it ; you must have a machine of some kind to carry it there.

14,499. Has it never been done ?—No ; it has never been done in the country, at least, I never knew of it.

14,500. Should you not feel more sanguine of keeping the dust down by water than by any reasonable amount of ventilation ?—No ; I think not.

14,501. Do you think that ventilation is the best ? —I do.

14,502. I thought you stated that ventilation had been carried now as far as it well could be ?—Yes, to meet all ordinary cases.

14,503. And yet the men are subject to very great annoyance from the dust ?—Yes, and they always will be; where there is a drilling of holes, and striking against the stone with a hard substance as in a quarry, there must be dust as the natural consequence.

14,504. Do you see no remedy for that ?—No, I do not see my way very clear for it, at least, to make it practicable.

14,505. Suppose that a respirator could be invented to keep the dust away out of men's mouths, do you think they could be induced to wear it ?—I cannot say.

14,506. Do you think there would be much difficulty about it ?—I cannot say ; we have sometimes thought that if the men would let their beards grow, it might be some advantage to them.

14,507. Do the great majority of the miners who reach the age of 40 suffer from lung complaints ?— Yes, the greatest majority.

14,508. Is it at the age of 40 when they begin to be affected ?—They begin to feel the effects of mining generally at about that age.

14,509. Have the Commissioners been correctly informed when they have been told that a miner of 50 looks as old as an agricultural labourer of 60 ?—I cannot say, this is not an agricultural district, it is generally all in mines, and for one agricultural labourer I know 100 miners.

14,510. (*Mr. St. Aubyn.*) You have stated that in your opinion the ventilation of the mines is so good that it cannot be improved upon ?—Yes.

14,511. You have also stated that one of the principal causes of disease amongst the miners is the dust, and I would ask you whether the possibility of inventing a mechanical contrivance to get rid of the dust by means of water has ever been considered? —I do not know that it has ever been fairly considered, at least it has never been brought into use, the thing may just have been the subject of conversation and thought, but it has never become the subject of general discussion.

14,512. (*Mr. Kendall.*) How long have you been the agent of these mines ?—15 years.

14,513. Before that were you a practical miner ?— Yes ; I was about nine months in training before I came here.

14,514. In the course of those 15 years, have you been principal agent here ?—No.

14,515. Are you now principal agent ?—Yes.

14,516. For how long a period have you been principal agent ?—About a year and a half.

14,517. Have the mines been profitable during the last five years ?—No.

14,518. Have they been profitable in the last 10 years ?—I should think so, stretching over that period.

14,519. Do you mean to say that it is probable, when the mines are not paying the cost, that the same amount of care and attention would be paid to the ventilation as if the mines were being worked at a profit ?—Yes, I mean to say so in our own ; if the thing cannot be fairly done the company will not do it at all.

14,520. The company are so liberal that rather than a man should run the slightest risk they will lose money ?—Yes.

14,521. (*Chairman.*) You have no bunnings in your mine ?—Not stopping bunnings.

The witness withdrew.

Mr. Thomas Wilson Crawhall examined.

Alston.

Mr. T. W. Crawhall.

6 Oct. 1862.

14,522. (*Chairman.*) Of what mine have you charge ?—Rodderup Fell. It belongs to the Rodderup Fell Company.

14,523. Have you charge of any other mine ?—Hudgill Burn

14,524. How many men have you working underground ?—We have at Rodderup Fell about 110, and at the other mine about 27.

14,525. How do you enter the mine ?—By levels entirely.

14,526. Not by shaft ?—No.

14,527. From these levels are you now sinking or working rises principally ?—The principal mode of working is by rises. We are now at Rodderup Fell sinking below the level, but only within this last two years, as we cannot get a lower level. We are therefore obliged to sink ; we have only got down a few fathoms. We have not completed any explorations there yet ; we have not more than 10 fathoms.

14,528. Is there water there ? — A considerable quantity.

14,529. How deep shall you go before you drive ? —We shall drive off in the course of another fathom or so ; it will depend upon the sill. We shall very likely drive off for a short exploration in another fathom.

14,530. Would the mine be drowned with water there ?— We have a good deal of water but we have two hydraulic engines, one of which we find at present quite sufficient to keep out the water.

14,531. Is that worked from the surface ?—No ; the engines are underground.

14,532. In sinking or rising have you ever found the air bad ?—Occasionally, while we are rising.

14,533. What means do you adopt in that case ?— We make a communication through to the level above, which gives us a good circulation.

14,534. Is there any means of obtaining air till that communication is made ?—We just take extra precautions to close up the back rises so as to bring air forward until we get a new communication made.

14,535. Is that by closing up with wooden doors ? —Yes ; we generally close up all round and put trap-doors either into the drifts or in the rises, so as to close all communication excepting along one air drift, which we always have. About four fathoms above the level we have an air drift which we drive up, so as always to keep up with the level.

14,536. What is the size of the air drift ?—About five feet high and three feet wide.

14,537. And that is driven above the level ?—Yes.

14,538. (*Mr. Holland.*) Are your two drifts parallel to each other, one above the other ?—Yes ; the air drift is about four fathoms above, and we have frequent rises between the two.

14,539. (*Chairman.*) How frequently do you communicate ?—Generally about every 15 or 20 fathoms. We may occasionally have it as far as 40 fathoms, but only at a chance time, owing to the mode of working. We sometimes may have been able to do without an air drift by cutting a vein above and closing it up, which will form an air drift of itself ; also commencing from the level where we have good air we form the rises as we go on, and that saves the necessity of putting up rises.

14,540. How do you judge whether there is bad air ? —Simply from the difficulty of the candle burning and the greater heat; but that rarely occurs. And then we put a rise up to the level above, it is 30 fathoms above. We have what we call the middle level, 30 fathoms above our present workings, and we immediately make a communication with it.

14,541. But till that communication is made, and when you find that the candle will not burn, what means do you adopt ?—We have never had a place in that level yet that I have known where the candle would not burn.

14,542. But you have to put it on one side ?—Yes, occasionally.

14,543. What means do you adopt for supplying air ; is it either by fewer men working or by stopping the working, or by artificial means ?—Principally by putting on trap-doors when necessary, so as to force the air round the workings.

14,544. Do you find that sufficient ?—Yes, generally sufficient.

14,545. How long will the powder smoke be in getting away in a case where the candle will only burn on the side ?—I cannot tell exactly.

14,546. Is it a long time in getting away ?—Occasionally. It will depend entirely upon the amount of air, and that varies considerably with the weather ; the weather often has an effect.

14,547. How do the smoke and foul air escape ; is there an up-cast shaft where they go out ?—Yes ; we have one communication from the surface by means of these other levels.

14,548. Does the shaft which communicates with the other levels and to the lower level always act as an up-cast shaft ?—Yes ; the middle level is the principal airing source.

14,548*a*. Is it for taking the air out or for bringing air in ?— It will act both ways, according to the state of the weather ; sometimes what is a down-cast one day may be an up-cast another day, but more commonly the middle level is the upcast.

14,549. And the bad air, and powder smoke pass out through the middle level ?—Yes, they may come out of the level mouth; there are several modes by which they might escape, but that is the principal.

14,550. Are the men ever obliged to leave the work for a time on account of the air being close ?—We have no such places at present, we have had isolated places where we have been sinking or rising (generally rising) where they have had difficulty in working and where they have had to leave, especially in the month of August, we generally find that about our worst time in the year, but those are almost invariably places which we are rising to get fresh air to the workings, and of course it is worst just at the top of the rise.

14,551. Until that is completed the air is bad ?— Yes, there is rather a deficiency of air, a want of circulation.

14,552. Is there any carbonic acid from fissures in the rock ?—I do not think that there is any worth mentioning in either of these mines, there may be a little occasionally.

14,553. Have you ever seen any place where it was so bad that the candle would go out ?—There is one place and one place only, but that is a level where there were never more than four men working, and there we some years ago made a communication with the level above which caused it to be as good for air as anywhere else.

14,554. Did those men suffer while they were working there ?—If they suffered at all they came out at once.

14,555. Did they complain at all ?—No, I never heard them make any particular complaint.

14,556. Have you ever yourself felt the effect of that air ?—I have been in it occasionally when it was so bad that I could not get into the forehead, but that was just at change times, it was a place which depended very much and more than usually upon the state of the weather ; and I have known the men on some days work with great ease and comfort and on other days they would go in and have to come out immediately ; we were in the course of putting up a rise and having communication. What made it worse was that we had water in this part and had great difficulty in getting it holed, but there were never more than four and often only two men, it being a place of no great importance, if there was any difficulty we let it stand ; it is a considerable distance from the main workings of the mine, it is not near them at all.

14,557. Are the bargains let quarterly or yearly ?— Quarterly.

14,558. How are the men paid?—We advance them 2*l.* a month and they are paid off annually.

14,559. How much do the men earn; what are the highest wages?—Perhaps some partnerships may make 70*l.* or 80*l.* each man in the year, that is amongst the highest; we generally have some who make about that.

14,560. And what would be the lowest?—Some of them might be as low perhaps as about 20*l.*, but that is rare, because those are the extremes; our men will commonly make about 40*l.* to 50*l.* a year clear.

14,561. From 18*s.* to 1*l.* a week?—Yes.

14,562. Have the men any climbing from one level to another; how do they go from one level to another?—They do not require it unless for their own objects; there are frequent communications between these two levels, but we have no one working in the middle level; if they like it they can go in by the middle level and descend by ladders, it is by ladders entirely.

14,563. What is the greatest depth from one level to another?—30 fathoms, but nearly all of them go in at the low level, and then they have simply to climb up to their place of working, which may be close to the level, or they may have to climb up nearly the 30 fathoms if we have got out nearly to that point.

14,564. Are the men allowed a certain amount of candles?—They get whatever they require, they pay for the candles.

14,565. What do they pay a pound for the candles?—We generally put a fixed price of about 8*s.* a dozen, and we keep a stock at the mine, and they come every Monday and get whatever candles they may require.

14,566. May they bring their own candles if they like?—Yes, they may get them anywhere they like.

14,567. (*Mr. Holland.*) Is that about the retail price in the district?—Perhaps a trifle more, we generally put such a price as not to have to vary, the men prefer that and then they know exactly what they are paying; if they like to get them elsewhere there is nothing whatever to prevent them. In reckoning for the men we deduct the candles or the gunpowder which they have.

14,568. (*Chairman.*) For tools how do you manage; do you supply tools, or do they supply them?—We partially do so; we sharpen the tools, and they get some portions of tools from us and partly they get them elsewhere.

14,569. Are they charged for sharpening the tools?—No.

14,570. Is there a doctor attached to the mine?—No.

14,571. Is there a club?—There is no special club attached to the mine; most of the men are in some of the benefit clubs in the neighbourhood.

14,572. There are no deductions for club money?—None whatever; there are no deductions excepting for school; they pay 6*s.* a year each workman.

14,573. Whether married or unmarried?—Whether married or unmarried, and the children go for a penny a week; all our children are charged for.

14,574. Do they avail themselves of the schools?—Yes, generally; many of our men are living at considerable distances; some live at Alston, and some up at Garrigill, which is in the opposite direction, but we have a rule that if they live more than a certain distance from the mine they must lodge either at the mine or in the neighbourhood.

14,575. Have you lodging-houses at the mine?—We have some lodging-houses, and there are also several houses belonging to the company which have been built larger than they would have been; they are better houses, in order to facilitate the taking in of lodgers; a good many get in in that way.

14,576. Do you charge them so much?—The lodging is free, and we find coals.

14,577. Do they find their own bedding?—Yes; if required we put up a few bedsteads.

14,578. How many should you suppose that you have generally lodging in your own houses?—I can scarcely state the number; it varies considerably.

14,579. How many do you allow in one room?—Just as many as they can get the beds put in for; they generally have two in a bed.

14,580. Do they stay there for the whole week?—They generally come on the Monday morning and leave on Friday night; sometimes rather early; they will sometimes perhaps go home say on Wednesday night, coming back on Thursday morning, and then finally leave on the Friday night.

14,581. Do the men who do not lodge there change their clothes when they come out of the mine?—No, they generally go direct home as they are.

14,582. Do they get wet at all?—No, there are very few wet places.

14,583. (*Mr. Holland.*) Are they wet with perspiration?—I wish they were a little more so. I do not think that they suffer very much in that way.

14,584. (*Chairman.*) Are there men who suffer from shortness of breathing?—Yes; the men have complained of it; they suffer very much in course of time from that.

14,585. At what age does it show itself generally?—I think that a great many get to be old men at 40 or 50.

14,586. To what do you attribute that?—I think that in course of time it is the quantity of small dirt and mineral which they inhale into the lungs, small particles of spar, and no doubt the powder smoke, and, perhaps a little deficiency of air occasionally help it materially; but I believe that it is more the fine particles of spar which they get into their lungs than anything else.

14,587. (*Mr. Davey.*) Where do you take up your air from which you are going to communicate from one level to another? Do you take it up from the shaft or from the last winze which you have communicated? You use a blast, I presume?—No, only in cases of great difficulty.

14,588. I am taking the case which you mentioned just now, where there were 40 fathoms distance from one winze to another. In that case we would put in a fan blast; we always have a few fan blasts on hand.

14,589. Where do you place that fan blast; is it from the last winze?—From the last place where we have good air, wherever it may be.

14,590. When that is communicated would you have sufficient air there?—Yes, sufficient to blow a candle out.

14,591. Although it is 40 fathoms distance?—Yes, quite sufficient.

14,592. What size is your lode generally?—It varies; it is very often about 14 or 15 feet wide; sometimes not more than six or eight.

14,593. And what is about the produce?—It varies so greatly that I can scarcely state.

14,594. Are you obliged to take away the whole of the lode?—Where it is good we do.

14,595. But are there many poor parts which remain in arches?—Yes, we have merely drifted through them.

14,596. Do you ever use stone arches?—We generally put stone arches into the levels.

14,597. Do you find them more economical?—I consider them in the long run much more economical than wood, though in the first instance they cost a little more.

14,598. Was there any particular reason why you should go 40 fathoms before having any communication?—None, but that we had no deficiency of air; we would not do it unless it was good enough for air.

14,599. You had a sufficient blast to work for that distance?—Yes; if there are no other men working in there, there is no difficulty whatever in four men going 40 fathoms.

14,600. In two shifts?—Yes, two men at a time.

14,601. (*Mr. Kendall.*) Are your miners as a whole a sober set of men?—Generally speaking, they are a sober class of men.

ALSTON.

Mr. T. W. Crawhall.

6 Oct. 1862.

14,602. You do not think that any of their ill health arises from intemperance ?—Occasionally there are some who are intemperate. but generally, until they get broken winded, as they call it, I think they are rather a healthy set of men.

14,603. Do you think that the quantity of dust which they inhale creates thirst ?—I do not think that they are great drinkers. I have noticed a great difference between the miners and the pitmen in that respect. While the pitmen are enormous eaters, and drink a great quantity, the lead miners are generally small eaters, and do not, I think, drink nearly so much as the pitmen.

14,604. What are the average wages among your men ?—They make about 18*s*. or 20*s*. a week.

14,605. Are there a large number of proprietors in the mine of the Rodderup Fell company ?—Not a very great number ; a large portion of it is in two or three hands. My father and uncle are the largest owners in both these mines.

14,606. What royalties do you pay ?—At present we are paying one tenth.

14,607. Did you ever pay a higher royalty ?—Until quite recently we paid a seventh.

14,608. Are you making profits now ?—At Rodderup Fell we are making profits, and have been for very many years, but at Hudgill Burn we are losing money.

14,609. What is your return at Rodderup Fell per month ?—We do not make up any monthly produce at all, we have annual produce, that is perhaps, about 3,000 bings, a bing is 8 cwt.

14,610. What are the first symptoms of the miners being what you call broken-winded ?—There is a difficulty in breathing.

14,611. What do they complain of, any weakness ?—No, it is more a difficulty in breathing, and perhaps they first find it when they are climbing.

14,612. Is it a sort of asthma ?—It is a sort of asthma.

14,613. If they change localities do they recover ?—I do not think that if they once get bad they will ever entirely throw it off, they may be fit for several employments, but they will never be entirely well.

14,614. If you removed them to the surface, do you think that that would check its progress ?—We often do so ; if a man comes and makes a well-founded complaint of feeling rather broken-winded, if we have any vacancy at the surface, we give him perhaps, a quarter or half a year or a year, as the case may be, at surface work.

14,615. And do you send him down again ?—If he is fit for it.

14,616. (*Mr. Holland.*) Do they become fit for it afterwards ?—If they are not very bad. I have no doubt that if men are at the proper time of life they will last another dozen years in the mines by that means.

14,617. (*Mr. Kendall.*) Still they are more susceptible than other miners ?—Means should be taken to stave it off almost before they begin to feel it themselves.

14,618. (*Mr. Holland.*) I suppose it comes on very gradually ?—Yes.

14,619. (*Mr. Kendall.*) Do the medical men ever report to you when a man is becoming so, and advise a change ?—No.

14,620. (*Mr. Holland.*) What is your explanation of the miners eating less than the colliers ?—I do not know, unless it is something in the nature of the coal pits which makes them such enormous eaters.

14,621. I suppose the colliers work harder ?—While they are at it the colliers work much harder.

14,622. But I suppose the miners work as hard as they can ?—Yes ; it is of a different nature. In the pits it is principally pick-work.

14,623. Is pick-work harder than beating borers ?—It requires quicker work in the time. I do not think it is harder work, but it is quicker work, and it will make the pitmen perspire very much more than the miners.

14,624. They drink more ?—Partly they do drink more, and the pits are very much hotter than the mines. Many of our mines are cool, and on an average in fact they are cool.

14,625. Do you think that the air in the mine is so close as to injure the appetite ?—No, I do not think so ; even those men who are very little in the mines are also small eaters in proportion to pitmen.

14,626. What difference of level is there between the adit and the workings ?—30 fathoms.

14,627. What is the difference of temperature ?—I never took the temperature, and therefore cannot say.

14,628. Does the lower level feel like summer heat ?—No, it is quite cool and pleasant to go into in summer.

14,629. In August is it bad ?—We have generally noticed that in any bad places August is about the worst time of the year.

14,630. Is that because August is warmest outside ?—I suppose so. There are greater fluctuations probably from that circumstance, that the current of air will become stagnant and perhaps reversed.

14,631. Do nearly all the miners become broken winded when they get to 40 ?—It is perhaps hard to say that, but a good many do.

14,632. A very large proportion ?—A considerable proportion, say at 50, at any rate. I would not say 40, but by 50 they do.

14,633. You consider a miner when he gets to be from 50 to 55 an old man ?—Yes, if he has been all his life in the mines.

14,634. Is that a general observation ?—Yes.

14,635. (*Chairman.*) What length of level have you driven at Hudgill Burn ?—I suppose that we may have about 600 fathoms at our principal level, but we have an immense number of old levels.

14,636. It is in connection with the old levels ?—Yes ; all crossing each other in every direction.

14,637. How many men have you working there ?—At present we have about 27 men under ground.

14,638. Is the air there all good ; have you no difficulty there with the air ?—None whatever; we have so many old levels, that through the old workings there is always a circulation of air.

14,639. Do the men ascend from one level to the other by ladders ?—We have none at Hudgill Burn. At Rodderup Fell they generally ascend by ladders, or in temporary cases what are called stemples; we put in strong pieces of wood about as thick as your arm, one on each side, one here and at a foot or two another on the opposite side, and so on. In the small rises, I think that stemples are much better than ladders, they are easier; they are better, I think, in the very small places.

14,640. What is the greatest height by means of stemples that you would let the men climb ?—We have not generally places very high, it may be 20 fathoms.

14,641. In going the 20 fathoms, is there no soller across ; is it one continuous rise ?—There is generally some break in it.

14,642. Is not a man more likely to fall ?—He cannot fall ; they are too small.

14,643. Do the men take their tools in waggons into the mine, or do they carry them in ?—They partly carry them in, and they partly go in by waggons.

14,644. They have to carry them in sometimes ?—Occasionally.

14,645. That is a long distance ?—Yes, it is a considerable distance.

14,646. What is the longest distance at either of the mines ?—At Rodderup Fell, if they carried them into the west end it would be nearly a mile.

14,647. Are there any wet shafts at Rodderup Fell?—Down below level we have a great quantity of water, and there it is wet.

14,648. Is that pumped ?—We have an hydraulic engine to pump the water.

14,649. Do the men get very wet working there ?—Yes, and they work shorter hours down there at present.

14,650. Do they change when they come up ?—They do.

14,651. Where do they change ?—In the shops close to the level mouth.

14,652. So that though the men live at a distance they can change in the shops ?—Yes.

14,653. Do you give them waterproof clothes ?—For the sinking we have got a few suits.

14,654. Do the men like to wear them ?—Yes, if they make an application for anything of that sort, I always get it for them.

14,655. Is it not hot for them to wear them ?—We leave it entirely to their own discretion ; if they like to wear them I never hesitate to get them.

14,656. (*Mr. Holland.*) Have you noticed whether the miners frequently catch cold ?—I do not think they do particularly ; they are perhaps rather liable to consumption in this neighbourhood.

14,657. As well as the miners' complaint ?—Yes.

14,658. Is it the younger miners who are liable to consumption ?—Yes; I think that five or six may have died during the last dozen years belonging to Rodderup Fell, who have gone off in consumption at about 24 or 25.

14,659. Out of what number ?—About the number which we generally have. I do not think that more than about six men have died from common consumption in perhaps the last 10 years.

14,660. Out of how many men ?—Say an average of 100, and we have always a large proportion of young men in our mines. They are principally young men. I think that we have generally more young men in our mines in proportion than they have in most of the others. We do not take any men underground under 20.

The witness withdrew.

Mr. Jonathan Walton examined.

14,661. (*Chairman.*) You are the manager of Dowgang mine ?—Yes.

14,662. Have you the charge of any other mine ?—There is another mine, but it is only just a temporary sort of thing. Nattras mine.

14,663. How many men have you working underground altogether ?—Somewhere about 18 to 20 on an average.

14,664. How far is the level driven in ?—About three-fourths of a mile.

14,665. Are you sinking from that level or are you rising principally ?—It is upon a level and above the level.

14,666. In those workings have you ever found any air when the candle was obliged to be put on the side to burn ?—Not often. There are different times in the season when it is the case. Autumn is generally a bad time, but when the air is in a proper condition we generally find the candles good.

14,667. But in autumn that is occasionally the case ?—Yes.

14,668. What do you then do ?—We examine our air courses, and sometimes they are not in a good condition and we improve them. We open them out and then the thing goes right again.

14,669. If the air courses are in good condition you have no fault ?—No fault.

14,670. How do these get filled in ?—The stuff falls down sometimes and stops the course.

14,671. Have you an air course driven above your level ?—Yes.

14,672. How far above your level ?—Some two or three fathoms above.

14,673. At the end does it communicate with a shaft ?—Yes ; it communicates with a shaft about 150 or 160 fathoms from the level forehead.

14,674. Does that shaft act as an up-cast or a down-cast ?—It changes ; sometimes in fine weather it is a downcast.

14,675. Sometimes the air shaft is an out-cast ?—Yes.

14,676. And sometimes it is the reverse ?—Yes.

14,677. Have you ever used any artificial means for ventilation ?—Never.

14,678-9. When you find that the air shaft has got stopped up, have the men complained to you about it or do you ascertain it ?—We ascertain it immediately in the working ; by the candles not burning bright.

14,680. Is that the only way in which you judge ?—We see that the smoke does not go from them ; it hangs round them.

14,681. How long does it hang ?—When the air course is right only a few minutes.

14,682. But when the air course has been stopped up how is it ?—Then it does not get away for some time.

14,683. (*Mr. Holland.*) How long ?—It is possibly half an hour or so before it gets away.

14,684. (*Chairman.*) How long are the bargains ?—Generally quarterly ; sometimes half-yearly.

14,685. Have you four men in a party ?—Sometimes four and sometimes six. We have six just now in our level fore-head, generally four.

14,686. Are those six men working in shifts ?—No ; we consider five eight-hour shifts to come in a week.

14,687. Do they work any night shifts ?—Not often. It is a wide working ; 16 or 18 feet working.

14,688. Then the whole of the men very often work together ?—Yes, generally altogether.

The witness withdrew.

Dr. Charles Arnison examined.

14,689. (*Chairman.*) Where do you reside ?—In Alston.

14,690. Have you charge of any mine especially ?—I have not.

14,691. You are the medical man of this district ?—Yes : one of the medical men of the district.

14,692. How long have you been a medical man ?—I have been practising in Alston for the last 20 years.

14,693. In your experience are there many now working in mines who are affected with what is termed the miners' disease ?—There are a great many in this district.

14,694. At what age should you say that it first shows itself ?—It varies considerably ; but I think for the most part at about 30 it manifests itself ; but persons of robust constitutions resist it longer.

14,695. Have you any cases now under treatment ?—I have none but some chronic cases. Being a general practitioner, there is a medical man appointed for the miners in this district, and of course he has the greater part of the practice ; he resides at Nenthead.

14,696. But still you have many cases ?—Yes ; I have several cases.

14,697. Do you ever have a post mortem examination ?—No ; we have no post mortem examinations in this district ; there is a great objection to that sort of thing here. I am very sorry that it should be so, as I think that that might throw considerably more light upon the subject.

ALSTON.

Dr. C. Arnison.

6 Oct. 1862.

14,698. By what do you think that this miners' disease is occasioned?—The impure atmosphere of the mine, bad air, powder reek, aggravated by particles of dust constantly floating. Cold predisposes to an attack.

14,699. (*Mr. Holland.*) Do you mean catarrh?—Yes. Then there is often a sort of irritation of the mucous membrane of the bronchial tubes; the dust irritates the air cells, and of course one attack after another keeps up a constant irritation, and it ultimately settles on the bronchial tubes.

14,700. (*Chairman.*) Do you think that bad air predisposes them to it in any way?—I think that it has an effect most decidedly.

14,701. Have you ever observed the expectoration of the men?—Frequently.

14,702. Is it much impregnated with dust?—It is.

14,703. Have you ever advised the men who have come to you not to go back to the mine?—Frequently. In some of the mines they are in the habit of taking them for out-door work, and after they are in a certain stage I recommend them to be employed as out-door labourers, which has a beneficial effect upon them.

14,704. Have you ever known a man when once affected recover completely?—Never.

14,705. Then should you say that they die earlier than other labourers in consequence of this disease?—They die considerably earlier. If you were to take 60 or 70 of the miners in the district, I should think that 17 of them would die before they were 50 years of age; of course I cannot speak with any degree of accuracy to that.

14,706. (*Mr. Holland.*) Is it rare for them to survive 60?—Yes; it is not common for them to survive 60.

14,707. And they are old men at 50 I suppose?—They are.

14,708. Do you consider this disease completely distinct from phthisis?—It is different from phthisis I think in many cases, inasmuch as there is generally considerably more difficulty in breathing, although the pain is very trifling; there is merely a stitch in the side, and a common blister or mustard plaster removes it. I often find a gentle emetic and mild expectorants beneficial to them in the early stages; they do not bear active treatment at all.

14,709. Is the expectoration very adhesive?—It is.

14,710. Like that of asthma?—Of much the same character, I think.

14,711. Is it ever purulent?—Occasionally, in the latter stages.

14,712. In the earlier stages also?—Not generally.

14,713. Is hœmoptysis common?—You meet with it occasionally, but it is not very common.

14,714. Is it uncommon?—I cannot say that I have met with it often.

14,715. What do you mean by hœmoptysis; merely a streaking of blood?—Yes.

14,716. Is there any liquid blood with it?—I cannot say that that is common.

14,717. Can you say that the spitting of liquid blood is uncommon?—I cannot say that it is common.

14,718. Do you ever find cavities?—Yes.

14,719. Where?—In various parts, but I think under the right clavicle.

14,720. Is that common in men of 40 and upwards?—I think it is.

14,721. You have cases of consumption, of course?—Yes.

14,722. Is there much noise of respiration of the bronchial tube?—Yes.

14,723. As if it were contracted?—Yes.

14,724. Is that common?—It is common to have a wheezing or something of that kind.

14,725. Is it universal in miners' complaint?—Seldom if ever without a wheezing.

14,726. The disease is very slow in its progress, is it not?—Very slow, but there is a difference in cases. In some cases they run their course rapidly, in others they linger on for two or three years.

14,727. Is it not a common thing that they linger on for years?—It is.

14,728. If a man changes his employment and works above ground, may he continue ailing a long time without getting worse?—They do.

14,729. A very long time?—Yes.

14,730. That very rarely happens in common consumption?—No, it does not happen in common consumption, but in miners' cases it does; there is not nearly so much warning in common consumption.

14,731. Do you think that they suffer much from the powder smoke?—I think that that renders the air still more impure.

14,732. That has not come much under your observation, perhaps?—No, I have not been much in mines. There is one thing I think with regard to the miners here, that a little more attention to ablution would be very much in their favour.

14,733. (*Chairman.*) Is there any provision for washing for the men coming up from the mine?—I am not aware of any, but I would suggest that something of the kind should be adopted, which would be very beneficial to them.

14,734. (*Mr. Holland.*) Do you mean to recommend washing the whole body, bathing in fact?—I do most strongly. It would be a most important protection.

The witness withdrew.

Dr. RAILTON GILL examined.

Dr. R. Gill.

14,735. (*Chairman.*) Are you a doctor of medicine?—Yes, and likewise a surgeon.

14,736. Residing at Alston?—In the neighbourhood close by.

14,737. Have you the special charge of any mines as medical man?—No.

14,738. Do the miners consult you?—Frequently.

14,739. Have you observed any disease peculiar to miners?—Yes, I have observed a form of bronchitis, with a pigment or secretion from the lungs, and that pigment which they secrete from their lungs seems to increase with the time that they have been working in the mines.

14,740. Do you observe that in young men; at what age have you first observed it?—I have observed it after they have been from 20 to 30 years in the mines, sometimes they may expectorate earlier, but the disease to which they are subject appears not to be fairly established until they have been from 20 to 30 years in the mine.

14,741. At what age, at 40?—40 frequently, and sometimes before that.

14,742. At what time do they go to work in the mines here?—Some as early as 15 or 16 years of age, before they are half grown.

14,743. Do you think that those who go earlier to work are more liable to that disease than others?—Decidedly so; they have not the power of resisting it as much as men would do whose constitutions are more formed. Some men have the power of resisting disease far more than others.

14,744. What is the first symptom with which it developes itself in your observation?—Weakness of the frame, debility, attended with more or less of dyspnœa, difficulty of breathing, cough with expectoration, in fact a form of bronchitis.

14,745. By what do you think that that is occasioned?—I think it is occasioned by the deposition of carbonaceous matter in the lungs.

14,746. Is there any from dust?—Yes, black dust,

dust mixed with carbonaceous matter, the consumption of gunpowder. They blast all their rocks here, and form a great deal of dust, besides what is the residue of the burnt gunpowder, and candles as well. Lamp black, very likely, is another of the articles mixed with the dust.

14,747. Is there anything in the air to affect them?—There is an atmosphere deficient undoubtedly, in oxygen, and loaded very probably with carbonaceous matter or carbonic oxide.

14,748. Have you ever seen a case where a man has been affected completely cured?—Yes, I saw an old man to-day in the workhouse who was willing to come down here and show himself as a perfect case of cure; he wrought for 30 years in the mines, and he is now living, being above 80. I asked him how it happened that he had lived so long; he said that he had not done anything for the last 20 years, but he said "I got rid of it all about 20 or 30 years ago." I said "You got rid of what?" "I got rid of a great deal of that black spit." In fact, instead of its combining with the tissue of the lung, he got it expectorated, and then he got rid of the true source of the disease.

14,749. Had he gone back to the mine to work?—No, he is now in the workhouse, and has been for 20 or 30 years.

14,750. Since he has been in the workhouse he has got rid of that expectoration?—He has got perfectly clear of it. He has had a slight attack of cold or bronchitis lately; he has been under my care, but there is no expectoration of the black pigment, and I was rather surprised, he being an old miner.

14,751. Would that expectoration appear for some time after a man has left the mine?—It sometimes does not make its appearance for 20 years after they have been working in the mines, and then when their vital power becomes deficient they begin to get the bronchitis, and the exudation of this black pigment from a diseased mucous membrane.

14,752. So that after they have left working in the mine for 20 years they still spit up this black pigment?—Yes, if they lived 100 years they might spit it; it is what is united with the tissue of the lungs.

14,753. Supposing this disease shows itself after 20 years, how long will that black spit continue after that?—It may continue during the whole life.

14,754. Have you any case which you could show where a man is spitting that black stuff?—There is one man who I believe is not able to come here. He is spitting up occasionally that black spit, but mingled with three or four other secretions from his lungs, and he has likewise for the last two years been subject to hœmoptysis, consequently there is very probably a good deal of hepatisation or solidification of the lungs.

14,755. How long is it since he has been working?—He has been working in the last two or three years in the Rodderup Fell low level, which I beg to tell you is a very serious place indeed.

14,756. Have you any cases in that low level where the men are now affected?—I cannot quote the cases, but when they consult me I frequently ask them where they have been working. I lose sight of them for the time being from an attack of bronchitis, and it is only when they are dying that the thing perhaps becomes sufficiently notorious to attract one's attention. But I have had repeated cases of even young men before 40, and in fact before they have really got you may say, to their full growth, dying from that low level in this neighbourhood; a place called the low level at Rodderup Fell. Sometimes it brings on tubercular disease before a spurious form of melanosis or the black degeneration takes place; they die sometimes of tubercular disease by its concomitant effects on a weak constitution.

14,757. (*Mr. Holland.*) Is there any doubt that miners' bronchitis is quite distinct from phthisis?—It is quite a distinct disease.

14,758. In fact with hardly any resemblance except cough expectoration and wasting?—No resemblance at all, excepting some cases of consumptive individuals, and then they may have both, as in the case which I mention, where a man has had hœmoptysis and spitting of blood, and hepatification; he has likewise the black spit, which I believe is the primary cause of the disease.

14,759. Have you noticed whether true consumption is more or less frequent among miners than among the other population of the neighbourhood?—I do not think that it is more frequent.

14,760. Is it not less?—I think that it is less.

14,761. When miners are able to get work above ground who are suffering from this bronchitis is the disease suspended?—It prolongs their life a while.

14,762. You attribute the disease, I think, chiefly to candle smoke and powder smoke?—Yes.

14,763. And dust?—And carbonaceous matter.

14,764. Do you not think that the gritty matter has to do with it?—I do not think that it has as much as the carbonaceous matter.

14,765. You think that the carbonaceous matter from the imperfect combustion of candles and the powder smoke are more irritating to the bronchial membrane than the gritty matter of the stone?—I do not think that perhaps they are more irritating, but I think that the two together are highly irritating, more especially when they get combined with the tissue of the lungs. This immediately irritating matter is expectorated, but the carbonaceous matter forms a black pigment in the lung and you cannot get rid of it, whilst the irritating matter is often expectorated.

14,766. Do you know the black spit of colliers?—I have seen it; it is nearly similar to what we have here.

14,767. But colliers very frequently escape any permanent injury?—They do.

14,768. How do you account for that?—I cannot account for it except that the atmosphere which they breathe is different. A collier has a good appetite whilst a lead miner has a very poor one.

14,769. How do you account for that difference?—I cannot account for it excepting that the colliers have better ventilation.

14,770. Is not that a very satisfactory way of accounting for it?—Very likely, I cannot say, I have had no experience in the interior of coal mines.

14,771. If you knew as a fact that the collieries were very well ventilated, and we know what these mines are, would not you say that the difference of ventilation satisfactorily accounted for the difference of appetite?—I think so, the colliers get more oxygen to breathe and that is one reason why they have a better appetite, when men have a bad atmosphere to breathe their whole frame is depressed.

14,772. Are there instances of the black spit continuing for many years after the men have left their work?—Yes, many years.

14,773. Where does it come from?—It comes from the mucous membrane of the lungs.

14,774. Is it a secretion?—It is a secretion undoubtedly from the black lung.

14,775. Is it a stock of carbonaceous matter which they have laid in while they were working?—It may be a spurious form of melanosis which is capable of secreting this black matter; we have all forms of expectoration in some of those miners, I have sometimes seen three or four tinges or different kinds of expectoration, but the black is the most important and the most permanent.

14,776. Have you had any post mortem examination of a miner?—No; the people here are prejudiced against it.

14,777. Can you suggest any remedy to prevent the production of the disease?—Any suggestion which I could make would be to improve the ventilation—to let them have better ventilation in their mines, and to drive away this matter which they are breathing.

14,778. The avoidance of smoke?—The avoidance of dust from the combustion of gunpowder.

14,779. Do you attribute it chiefly to gunpowder?—Yes. They work all their mines here with gun-

ALSTON.
Dr. R. Gill.
6 Oct. 1862.

powder, and after they fire a shot they go back to work in this atmosphere charged with gunpowder smoke.

14,780. Do they use very smoky candles?—They use candles.

14,781. Do they smoke very much?—I believe so. They are used in my own house and I have noticed them smoke.

14,782. Would not the employment of some light which did not smoke so much as a candle be an important improvement?—Very great, I have no doubt of it. If you could prevent lampblack mixing up with other forms of carbonaceous matter in the mine, the consumption of gunpowder, and if you could get ventilation at the same time, a current of air through the mine, you would get rid of the cause of disease to a great extent.

14,783. Are the miners liable to catarrhs?—Very liable to coughs.

14,784. What is the reason of that; going home in wet clothes?—I suppose that one cause of their catching cold would be coming out of a heated atmosphere into cold air very often with wet clothes, but likewise from the irritation.

14,785. But it is said that it is not a heated atmosphere, that the mines are very cool?—I mean to say that there is a great deal of difference between the temperature of the mines and of the external atmosphere. The men come out of mines perhaps at 60° (I do not suppose they are ever much warmer or colder than that) to breathe an atmosphere 20° or 30° of Fahrenheit below that and at freezing point, and I have known it here sometimes down to zero.

14,786. But not often?—Not often. I know that they must come out of an atmosphere of from 50° to 60° to an atmosphere frequently down to 12° or 13° of Fahrenheit; therefore they must be liable to catch cold.

14,787. Do you know as a fact, from your own observation, that they do catch cold very frequently?—Yes.

14,788. Do you not think that that has something to do with the production of this bronchitis?—No doubt about it; it brings on catarrh.

14,789. Dr. Arnison has suggested much more frequent washing, baths, as a great protection against that; do you concur in that opinion?—They are a particularly clean set of men.

14,790. I do not think that he meant so much for the sake of cleanliness as of tempering the skin, and rendering it less susceptible of cold and damp?—I cannot say about that.

14,791. (*Mr. Kendall.*) You have never been underground yourself, have you?—I have been occasionally, but never much in the mines.

14,792. Not enough to offer an opinion of what you saw there; you only hear that the ventilation is bad?—I hear that the ventilation is bad, and I see the men who consult me.

14,793. And you hear that the powder smoke lies a good deal?—I hear it and I see it myself. They tell me that they sometimes have to sit a good while before they can go up.

14,794. All that you can judge of is the effects, but the causes you cannot speak of except from hearsay?—I cannot judge from my own personal observation.

14,795. From what you have seen you have no doubt that there is an unhealthy breathing of powder smoke and other carbonaceous matters?—Yes. I would refer the Commissioners to a very important paper by Professor Virchow, on the pathology of the miner's lung, also one by Dr. Thomson, of Perth, on melanosis of it; both those papers are published in the Edinburgh Medical Journal, for January to June 1859. I would likewise refer the Commissioners to a letter by myself on the same subject, published in the same work for July to December, 1858. In that letter I state "In the lead mines of Alston "Moor the work is almost entirely blasting with gun-"powder, and the effects on the lungs are such as "invariably produce dyspnœa, with occasional attacks "of bronchitis, with expectoration of mucus tinged "with carbonaceous matter. This tint varies from a "grey to a black colour, and the symptoms vary in "severity, according to the time spent, generally from "20 to 30 years. On approaching the latter period "however the vital power is weak, the pulse fre-"quent, more or less anorexia, dyspnœa, asthenic "bronchitis, with the usual signs of emphysema are "present; the expectoration when advanced, grey or "black, but mixed with muco-purulent secretion "from the congested mucous membranes, the strength "rapidly declines, and death occurs almost in the "same way as in tubercular consumption with the "exception of the symptoms arising from the fre-"quent complications of the latter. Such was likely "to occur in the case now to be mentioned."

The witness withdrew.

Mr. JOSEPH MICHELL PAULL, examined.

Mr. J. M. Paull.

14,796. (*Chairman.*) You are the agent for Greenwich Hospital?—I am.

14,797. Do you often visit these mines?—Yes, occasionally; perhaps twice a year; the larger mines oftener. I go through the mines in Alston.

14,798. Is that merely as regards the interests of Greenwich Hospital?—Principally as regards the interests of Greenwich Hospital.

14,799. Have they anything to say in the management of them?—Nothing; I do not consider that I have a right to interfere in the management of the mines, but merely as far as the hospital interests are concerned.

14,800. It is merely as to the produce and to collect the royalty?—The royalty in kind is collected by the clerk of ore deliveries, an officer appointed for that purpose. I merely inspect them to see that they fulfil the conditions under which they are let from the hospital.

14,801. (*Mr. Kendall.*) What is generally the length of time that they are let for?—The smaller mines are sometimes let for six months, but they are renewable at the end of every six months. We have some mines that have been working for a considerable time upon a take-note of six months. I renew them at the end of every six months. They are first granted by the receiver, but if the parties wish, they can have a lease of 21 years.

14,802. Do they pay for the take-notes?—No; the take-notes are, generally speaking, granted to working men; they apply for a take note, and they get a length of 1,200 yards on a certain vein, and 40 yards on each side.

14,803. I suppose that if they make discoveries they call a stronger party with regard to money to aid them in the undertaking?—Yes; and they generally apply for a lease afterwards.

14,804. Does the revenue vary very much?—Formerly not very much for years. They have, under certain conditions, reduced the duty lately in a great number of the mines, and of course that has made a considerable difference to the revenue of the hospital.

The witness withdrew.

Mr. JOSEPH RODAM examined.

Mr. J. Rodam.

14,805. (*Chairman.*) What is the name of the mine of which you are agent?—Bentyfield.

14,806. Have you charge of any other?—Yes, Grassfield and Nentsberry Greens.

14,807. About how many men have you working under ground ?—We have in the Nentsberry Greens eight, we have 13 in Grassfield, and 26 in Bentyfield.

14,808. What is the extreme length of any level driven from the day ?—I should think about 800 fathoms.

14,809. Is there any shaft communicating with it ?—It is driven until it is communicated with another level which comes in from the day.

14,810. So that there is a thorough ventilation ?—Yes, a regular ventilation through.

14,811. Is that an air level ?—It answers two purposes, an air level and taking out work.

14,812. Are you now working below that level or above that level ?—About the level.

14,813. Are there any shafts to the surface ?—Yes, but we have some of them closed on account of carrying the current of air forward.

14,814. In which does the air come in, and out of which does it go ?—In droughty weather the air generally soaks out of the level, and the shaft draws down, and when the weather changes there is of course a change there.

14,815. Have you ever the air so bad that the candles are obliged to be put on the side to burn ?—I have not been much troubled with it for the last 8 or 10 years, but I have seen such places.

14,816. Are they mostly young men who work with you ?—There are both kinds.

14,817. Are there any men working with you who are affected in their breathing ?—Yes, there is one.

14,818. Is he able to work at all ?—Yes, he can work quite well, but still he is a little affected.

14,819. Have you had any accidents in your mine ?—We had one.

14,820. What was it from ?—A man fired a hole.

14,821. It was from blasting ?—Yes.

14,822. Did you ascertain the cause of its going off ?—Yes, from charging the hole.

14,823. Did he use an iron tamping rod ?—No.

14,824. Was it brass tipped, or copper ?—It was copper ; I think that he had not been careful of the material which he had put in ; it was from his own neglect.

14,825. From using bad tamping ?—He had put in a bad material.

14,826. Are the men supplied with any special material, or is it left to them to choose the material ?—They have been particularly cautioned about that several times ; they have it lying by their sides, it may be two or three yards off ; I have seen a good deal of that.

14,827. Have you yourself ever worked in a mine ?—Yes ; I wrought about 15 years.

14,828. Where ?—At Brownyhill a good deal of my time.

14,829. Have you ever worked in poor air ?—Yes ; where we had to put two candles together in this way (*describing the same*).

14,830. Did you suffer from it at all ?—Yes ; it is very injurious to health.

14,831. Is there any mine now where one could see that ?—I do not know that there is one at the present day.

14,832. You do not feel the effects of it now ?—No ; I feel very little effects of it.

The witness withdrew.

Adjourned to To-morrow at Hexham.

HEXHAM.

Tuesday, 7th October 1862.

PRESENT :

The Right Honourable Lord KINNAIRD, K.T.	RICHARD DAVEY, Esq., M.P.
NICHOLAS KENDALL, Esq., M.P.	P. H. HOLLAND, Esq.
JOHN ST. AUBYN, Esq., M.P.	

The Right Honourable Lord KINNAIRD, K.T., in the Chair.

Mr. JOSIAH REMFRY examined.

14,833. (*Chairman.*) Will you have the goodness to state to the Commissioners the name of the mine or mines of which you have charge ?—The Derwent mine, that includes all the mines in the county of Durham, although there are various names ; the company have another mine in Northumberland, called the Shildon mine.

14,834. Then the Derwent mine is the Derwent company's mine ?—Yes ; there are different parts of the mine, such as Jeffrey's Ramshaw, East Whitcheaps, West Whitcheaps, Smithey Clough, and Grindstone Clough ; those are in the county of Durham. Shildon mine is in the county of Northumberland.

14,835. Will you state the nature of the ore ?—They are lead mines.

14,836. Do you smelt your ore ?—Yes ; on the works.

14,837. About what number of men do you employ ?—265 below ; there are a few labourers in that number.

14,838. Does that number of men working underground refer only to the mines in Durham, or also those in Northumberland ?—That number includes all that we have under the company.

14,839. Working the mines both in Durham and in Northumberland ?—Yes ; we have 8 in the Shildon mines ; the 265 include the whole number.

14,840. Are the mines entered by means of shafts, or from levels ?—The greatest number of our men enter through the adit level, which takes off some portion of the depth of the shaft.

14,841. The shaft is sunk from the adit level ?—Yes.

14,842. How far from the adit level is the deepest shaft ?—About 95 fathoms.

14,843. About how far is any one level driven from the day ?—The level probably is 300 fathoms in length ; I should say about that.

14,844. Is there more than one shaft sunk from the level ?—Yes ; in the level that I speak of, namely, in the eastern part, there are several shafts, which, if you saw the section, you would see at one view. (*The witness produced the same, and explained it to the Commissioners.*)

14,845. There are three shafts on that plan ?—Yes ; the eastern shaft is Taylor's. The main pumping is Jeffrey's.

14,846. How many shafts are there on that working, communicating with the surface ?—There is one to the east of Jeffrey's, which is Taylor's. Those two are the principal shafts for ventilating, and they are 375 fathoms apart.

14,847. Is either of them an up-cast and the other a down-cast ?—One is an up-cast.

Hexham.

Mr. J. Renfry.

7 Oct. 1862.

14,848. Is that constantly an up-cast?—It is constantly an up-cast.

14,849. Are there any artificial means to make it an up-cast?—Not at all.

14,850. It is natural?—Yes.

14,851. Is not that affected by the weather?—Yes, it is affected by the weather.

14,852. But is it so affected as to make it become a down-cast instead of an up-cast?—No; because the elevation of one shaft is so much greater, being 34 yards above the other; that makes it an up-cast.

14,853. But it does not act so efficiently on a calm day, I suppose?—I never knew it to act on a calm day or on any other day in any other way than as an up-cast.

14,854. How do the men enter the mine?—Through the adit level first generally. Some leave at the shaft top; but the main bulk of them go through the adit level first.

14,855. How do the men who enter by the adit level afterwards enter the shaft?—By ladders.

14,856. How do the men descend who go down by the shaft?—They do not generally travel in the shaft; sometimes they do. But there are footways on the working of the vein; there are ladders put in this, and the principal part of the men travel in that way in preference to going down the engine or any other shaft.

14,857. Why?—Because the footway is not continuous. Perhaps we go down for four fathoms, and then we may walk.

14,858. The shaft or shafts which go down from the adit level have continuous ladders I suppose?—Yes; the principal shafts, as shown on the section, the engine shafts; they are continuous and perpendicular from the surface down.

14,859. What length is each division of the ladders?—Some are $3\frac{1}{2}$, and from that to 4 fathoms.

14,860. At the end of each ladder is it sollered over?—Yes, with a man-hole and a guard at the foot of each ladder. We always keep a guard, or a hand-rail.

14,861. Have the ladders iron staves or wooden ones?—Wooden staves.

14,862. Are they round staves or the four-inch square staves?—Four inches by three-quarters, made of larch.

14,863. Have you any man specially appointed to look after all the timber work?—Yes, whose sole business it is to see it is kept in proper repair.

14,864. Is the ore drawn by cages or how is it brought to the surface?—By buckets.

14,865. Is it brought out to the day by the horse level?—Occasionally, but the main bulk of the stuff is taken in buckets to the surface.

14,866. Is the place where this ore is drawn bratticed off from the footway of the shaft?—The drawing shafts are separate ones altogether; there are not footways in the drawing shafts.

14,867. Do the men generally reside near the mine?—Most of them.

14,868. Are there any shops or lodging houses?—We have no lodging-houses, that is to say we have no shops, because those who bring their wallet, non-resident men, lodge with other parties in the neighbourhood.

14,869. When the men go in and come out of the mine do they change their clothes?—They all change.

14,870. Is there a place for changing?—Yes.

14,871. Is it provided with hot water and means for drying the clothes?—There are means for drying the clothes, but there is not hot water, the people in this country do not avail themselves of those privileges, most of them prefer changing at their own houses.

14,872. But if they choose they have the means of changing at the mine?—We have many Cornish men and Devonshire men, those change at the changing house and not at their lodgings.

14,873. What is the mode of drying?—We have a stove with a pipe running through the house, an ordinary dry.

14,874. Is it a pipe running through above?—It is above the floor, perhaps six feet.

14,875. Do you observe any difference in the men who change there and the others who go home to their houses, in getting cold or in getting off work from illness at all?—I do not.

14,876. How many boys and others have you working on the surface, washing and so on?—We have 108 at the wash.

14,877. Are many of those boys?—Most of them are boys.

14,878. Are any women employed?—Not at all.

14,879. Do they work under cover?—Most of them.

14,880. Do those boys work in the winter the same as in the summer?—When we are able to wash the ores, sometimes we are prevented from frost and boisterous weather; we employ them if possible on other work on the mines, either in or out of doors, so as to keep them employed when we are hindered in that way in the winter.

14,881. To what description of accident should you say the men are most liable in the mine?—That is a difficult question; we have had very few accidents, they have been very trivial, perhaps a cut finger, or a bruised hand, or anything of that sort.

14,882. Are the men liable to accident from the falling away of stone?—We never have had an accident from falling off the ladders or from the footways.

14,883. Have you had any accident from the roof giving away?—I do not recollect that we ever had.

14,884. Do you use wood at all?—We do a good deal, but some of our levels are walled and arched with stone.

14,885. Have you any accidents from blasting?—We have had slight accidents but not serious ones.

14,886. Do the men use the safety fuze?—They are prejudiced against the safety fuze; we have it and we are anxious for all to use it, but they have been so accustomed to the needle, or what they call the pricker in the north, that they prefer it.

14,887. Do they use a copper pricker?—An iron one.

14,888. And an iron tamping-rod?—Yes.

14,889. What material do they tamp with?—Shale or the borings from the hole.

14,890. Within the last three years do you know of any accident having occurred?—Since I have had the management, which is now nearly seven years, we have had no accident from blasting but one, that I recollect, and there the man lost the sight of one eye.

14,891. Have you a sick club or an accident club?—An accident club.

14,892. Not a sick club?—Not a sick club.

14,893. It is for visible hurt?—Yes.

14,894. What do the men pay towards that?—6*d.* a month per man.

14,895. Is a separate account kept of it?—No separate account is kept, the company pay the man 7*s.* per week and also pay the medical man; it is not conducted as it is in Cornwall, for instance, where the men pay to the doctor.

14,896. Is there a medical man specially appointed?—Yes, and he has a salary of so much per annum.

14,897. And the men do not pay anything beyond the 6*d.*?—Nothing beyond the 6*d.*; the company provide the medical man and pay the men 7*s.* a week.

14,898. So that there is no separate account kept?—There is no separate account.

14,899. Do the men ever object to the doctor who is appointed?—No.

14,900. Do you consider that the 6*d.* which the men have paid has been sufficient to meet the expenses of the club?—On the whole perhaps it may be sufficient, but I think that it would be bare enough.

14,901. Are the men generally healthy ?—Yes.

14,902. To what particular disease can you say that they are subject ?—The disease to which they are subject I believe is caused by their own carelessness or mode of working in a great measure.

14,903. What is the nature of that disease ?—They are in the habit of working the pick point when they ought to apply the wedge and consequently making more dust ; and they are in the habit of boring their holes dry when they ought to apply water ; the consequence is that they make more dust and from inhaling dust I believe that they get more harm than from any other cause in mining either in ventilation or in any other way.

14,904. Generally speaking are the mines wet ?—Generally speaking our mines are dry ; there is a little water in the bottom of the level.

14,905. Is water supplied to them or would they have to take it down with them for the purpose of boring ?—They would then have to go to the nearest level which had water, which perhaps might be a few yards off.

14,906. Is there any provision for men who are off work from sickness and not from hurt ?—There are clubs in the district.

14,907. Have there been many men at any time off work ?—Yes.

14,908. Have you observed that the illness which you think arises from dust affects the younger men or the older men most ?—Sometimes it affects young men suddenly ; we need not go below ground to prove that ; I have noticed myself stone cutters who have been in the habit of working on the sandstone to be affected in their breathing sooner than those who have wrought on other work.

14,909. Do you consider that the men who are affected who are working as miners are affected in the same way as the stonemasons ?—I do to a certain extent.

14,910. Are they not liable to catch cold coming out of those mines and going home in a wet state ?—They are liable, but I presume that they do not very frequently catch cold ; of the four witnesses whom we have here to day one has worked underground I believe continuously for 58 years ; the four will average 43 years and three months.

14,911. Do you know at all what would be the average age of the number of men who are working in the mine generally ?—No.

14,912. What is the youngest age at which you allow any to go underground ?—They are generally about 17 or sometimes 18 before they go underground.

14,913. How is the work let to the men ?—By contract.

14,914. How often in the year ; monthly ?—When it is yard work so many fathoms ; probably two fathoms or three fathoms, according to the cost of the ground.

14,915. Is the bargain made quarterly, yearly, or monthly ?—Quarterly for what is termed tribute in Cornwall or bing-tale in the north, but the yard work is monthly ; we have monthly settings.

14,916. In the case of the monthly settings how much do you keep in hand when the men are paid ?—A fortnight.

14,917. What proportion of the men who are working are tribute men ?—Say a third part.

14,918. What can tut-work men earn generally at the bargains which are let ?—On the average say 15*s.* per man for 40 hours working ; that is five eight hours.

14,919. Do they work in shifts ?—They do.

14,920. Are there night shifts ?—In places where we wish the work pressed on, but not generally, because it is the most costly way of working.

14,921. What can a tributer earn generally ?—We have some that earn a good deal and some that earn scarcely anything at all.

14,922. To those who do not earn anything do you grant subsist ?—We do.

14,923. How much ?—From 40*s.* to 50*s.* per month, according to the industry of the person ; the labour that he has done and so on.

14,924. Then before granting subsist you get a report from the agent as to the amount of work which the man has done ?—Yes, and the quantity of ore that he may get in the time ; on the whole I should think that the tributers will earn a little more than the tut-work men.

14,925. Do many for a time earn nothing ?—Yes.

14,926. That would not be the case with the tut-work men ?—No, they would not earn nothing, because they generally get something, although the bargains vary.

14,927. What is the lowest that a tut-work man who gets a bad bargain earns ?—I should think that the lowest which has come under my notice for a considerable period will not be less than 30*s.* in the month.

14,928. Has that continued for any time ?—Very seldom.

14,929. The bargain has only been for a month ;—Probably for half a month or a month, as the case may be ; sometimes we let our bargains for a month, but generally speaking, we give them a certain stint, two or three fathoms, and they may have a second or probably a third bargain too in the month.

14,930. What deductions besides the money for the club do the men pay. Do they pay for powder ?—Yes, and for candles.

14,931. What do they pay per pound for candles ?—8*d.* per pound.

14,932. And for powder ?—the same.

14,933. Are they limited in the quantity of candles ?—Yes.

14,934. How much is allowed them ?—A pound and a half per man, except (and that is frequently) where the air blows the candle much, and then they are obliged to have more.

14,935. In this section of mines which we have seen, are there any close ends at which the men are working now ?—There are no ends short of air or close ends that I am aware of.

14,936. If you have any, do you apply any artificial means of ventilation ?—We have not any artificial means of ventilation at present in use. I do not believe in artificial ventilation very much ; I believe that we ought to have more natural ventilation in every mine.

14,937. Before you have connected two levels by a rise or a shaft or winze, must you not then have the air somewhat close ?—Yes, we have to contend with those things ; then we keep one or more small fan blasts, and place pipes, and blow air during that short time.

14,938. That is what I alluded to as artificial ventilation—That is artificial ventilation, but the air is taken from a place near, where it is pure, and conveyed to the men.

14,939. How is that worked ?—By hand ; by a boy.

14,940. Is the pipe through which the air is blown wood, or iron ?—Principally iron.

14,941. Do you know to what extent you have ever had occasion to send air in that way ?—I have known it sent for 300 fathoms or more.

14,942. What is the size of the iron pipe ?—Six inches.

14,943. And has that been merely by a fan turned by a boy at the end of it ?—By a fan, but not turned by a boy ; a fan turned by a water-wheel.

14,944. But at present you have nothing of that sort in the mine ?—No, and we have no place to my knowledge which is short of air anywhere.

14,945. How long is the powder smoke getting away at the extreme end of any of the levels where you are now working ?—I do not think that we have any place save one or two but where it may get away in less than half an hour.

14,946. And you have no place where the candle has to be inclined so as to burn ?—Not at all.

14,947. Is there any part of these mines very

HEXHAM.

Mr. J. Remfry.

7 Oct. 1862.

wet?—There is no part very wet; perhaps out of the 264 or 265 men not more than half a dozen at present are subjected to water above their heads.

14,948. When that is the case, is there any means to protect those men from the wet?—We provide them with oiled jackets, and hats.

14,949. And are they able to work with those?—They are; they are made loose.

14,950. (*Mr. St. Aubyn.*) You said that in all places, except one or two, the smoke cleared away in half an hour after the blasting; will you state what is the nature of those other places where the smoke is more than half an hour clearing away?—Those places which are furthest from ventilation.

14,951. What is the distance from a rise in those places?—The place that I allude to is about 23 fathoms.

14,952. How long does the smoke take to clear away there?—In the fore, breast, or the end, I should think within half an hour, so that the men can work comfortably.

14,953. In what level is that?—In the 40 fathoms level, east of Taylor's shaft.

14,954. You said that you had brought four miners here to day, as witnesses?—I have.

14,955. What is the average length of time that those men have worked underground?—43 years and three months.

14,956. How many men have you working in the mine?—265.

14,957. Have you any men working in the mine who suffer at all from illness, which incapacitates them from working from time to time?—There are one or two in the district, who used to work at the mine that do not work now.

14,958. Have you any men at present under medical care from causes connected with their work in the mine?—I am not aware that we have; but the doctor is below, and he can answer that question himself perhaps better than I can.

14,959. What is the average length of time for which your men have worked, taking the whole men together in the mine?—I am not prepared to say that.

14,960. It is something less than 43 years and three months, is it not—I should say so; I will not say that those men are a fair average.

14,961. Then you consider working 43 years and three months to be exceptional with you?—Yes.

14,962. Then you would hardly consider those men whom you have brought here to day as witnesses to be fair specimens of the men who are working in the mine?—We have some better looking but I do not know that we have any worse.

14,963. Do you consider the witnesses whom you have brought here to day, whose average of work underground has been 43 years and three months to be fair average specimens of the men who are working in your mine?—No; I will not say that they are average specimens because to bring an average we should bring men who would look more fresh in appearance; they are certainly a fair average specimen for an old miner. We have some men who have worked all their lifetime, and we have others who have only just started, but as to the average I am not prepared to say how long those who have gone hence worked or what is the average.

14,964. What induced you to bring as witnesses men who had worked so long with you?—Because I thought that they were better able to give evidence than younger men, they probably might state what the mines were some years ago and what they now are, whether there is any improvement or not.

14,965. (*Mr. Davey.*) You have said that the miners suffer a great deal from the dust, are there no means of remedying the boring a dry hole?—Yes.

14,966. Do not you enforce that?—I have tried to persuade them.

14,967. You are aware that a hole would bore much quicker with water than it would dry?—I am aware of that.

14,968. And are there no means of convincing the men of that fact?—I cannot convince them of it.

14,969. You say that a mine ought not to use any artificial means of ventilation; will you tell the Commission what other means you would adopt?—When I said that, for instance, instead of two shafts being the number I would have as many shafts as the magnitude of the working called for; I am speaking of extensive collieries.

14,970. We are talking now of lead mines?—We have so many shafts that there is no scarcity in our mine generally speaking; therefore the only artificial ventilation which we want is in making a communication from level to level, which is only of a short duration. Our levels are generally about nine or ten fathoms apart, consequently we have from four to five fathoms to sink and to rise; some times at the meeting point one or probably both may be a little short of air.

14,971. Then you require an artificial ventilation?—If you choose to call a fan blast fixed in pure air conveying that air to those parties artificial ventilation, that is the only ventilation which we make use of.

14,972. Is your mine in limestone?—Some part of it.

14,973. Do you ever find any fissures in that stone?—Yes.

14,974. Do you find any foul air coming out of those fissures?—I will not say in the limestone but I have noticed foul air to come out from other strata; I will not say that I have noticed it in the limestone particularly; it is a stratified district, consequently our operations are not much in the limestone. We have the sandstone and we have the shist or shale which our operations are in; at present we have very little workings in the limestone.

14,975. Do you find your mineral in the sandstone and shale?—We find more in the sandstone than we do in the shale.

14,976. Do you find mineral in the sandstone and shale?—We do.

14,977. Where do you find the fissures which you speak of, in what stratum?—More especially in the vein which is embedded in the limestone or in the sandstone.

14,978. Does anything come from those fissures, any gas?—I have never observed any, the only thing which I have observed from that is by the candle.

14,979. What has been the effect of placing a candle close to the fissure?—If you put a candle near it or into it I have seen that which would almost make the candle go out; it would probably make it go out if you were to thrust it far enough in.

14,980. Is that from the force of the air coming out of the fissure or from the nature of it?—I cannot see how force can arise; it is from the nature of it.

14,981. If you put a candle does the flame move at all?—Yes; I have observed that, as if there were a current, but whether it first goes into the fissure and plays around it I do not know; I cannot see how it can come from the far end of it.

14,982. Is there a current which comes out of the fissure?—I cannot say that I ever observed anything to come out of it, but I have observed a motion in the flame of the candle when I have placed it within the fissure; but I never observed any extra motion of the flame of the candle when outside the fissure.

14,983. A current must come out to blow out the candles?—If there is a current I should think it must proceed from without first.

14,984. Does that affect the air in your level?—It would affect the air in a level which was not very well ventilated. We do not frequently meet with those cavities or fissures.

14,985. What is the monthly produce of your mine?—1,400 to 1,500 tons of ore in a year.

14,986. (*Mr. Kendall.*) As I understand you you object to artificial ventilation solely on this ground, that you do not like long drifts. You would have

communications as quickly as possible in order to prevent artificial ventilation. Instead of driving your level some 20 or 30 fathoms you would hole a winze to some other level; you prefer that to the artificial ventilation?—I do.

14,987. That is what you mean?—Yes.

14,988. Do you know much of the agriculturists in this neighbourhood?—No; I do not.

14,989. You do not see many of the agricultural labourers?—I see them occasionally.

14,990. Are they a healthy set of men?—Much like other districts.

14,991. Are they a healthier set of men than your miners?—They have a fresher appearance.

14,992. You say that Cornishmen sometimes come up here to work?—We have several.

14,993. Were they miners before they came here?—Yes.

14,994. Taking them as a body, are the Cornish miners that you have seen more delicate than your miners here?—No; I do not see much difference.

14,995. Have you inspected Cornish mines?—I have.

14,996. Taking the body of Cornish miners and the body of miners here, which should you say, from your observation, is the healthiest body of men, or do you see any difference?—I think there is a difference.

14,997. Which are the best?—Those in the north.

14,998. They are healthier men?—Yes, especially after a certain age.

14,999. A Cornishman at 40 is an older looking man than a miner of this district?—I should say so, although I have been now in the north upwards of 20 years. I have been in Cornwall sometimes. I was there only 12 months ago.

15,000. To what do you attribute the difference which you think there is between the two?—Extra fatigue probably; having deeper mines to contend with in Cornwall than in the north.

15,001. Do you think that as a body of men they work harder than the men here?—I should think that if there is any difference the Cornishmen would work the hardest.

15,002. (*Mr. Holland.*) Do you know the Alston Moor miners?—I do.

15,003. Are yours better or worse than they, or much the same?—Much the same, although the Alston Moor miners are superficial workers. I dare say they have long drifts, but they have nothing much in depth I believe.

15,004. Is there any marked difference in health between the miners who come from Alston and your own miners?—No; I cannot see that there is a marked difference.

15,005. They are much the same?—They are.

15,006. Do your miners, as a class, remain in good health until they are 50?—Yes; our men generally enjoy good health. Their general health is good.

15,007. Is their wind good and sound till 50 as a class?—No; I cannot say that.

15,008. Is it so till 40?—Some are affected.

15,009. I am speaking of them as a class?—I should say not the whole.

15,010. If you took 100 miners of 40 would you find 50 bad in the wind?—Perhaps affected.

15,011. And at 50 very much affected?—Some.

15,012. Would they find a difficulty in getting up a hill at 50?—Probably.

15,013. Is it the case that the miners here as at Alston die of chest disease to a large extent?—Some have that complaint, but I am not aware that any die very young from it.

15,014. Do not a large number of those who get above 40 die of disease of the chest?—I am not prepared to say. The medical man will answer that question better than I can.

15,015. Do your miners suffer a good deal from powder smoke or candle smoke?—They do not suffer much from either. They suffer more from candle smoke probably than they do from powder smoke, because the candle is a constant companion, and they cannot avoid inhaling the smoke from it.

15,016. But the mines are never quite free from powder smoke, are they?—Either one part of the mine or the other has powder smoke in it probably.

15,017. Your opinion is that they suffer more from candle smoke than from powder smoke?—That is my opinion.

15,018. Do they suffer much from dust?—I fear so.

15,019. You think that they do?—Yes.

15,020. Do you think that there is any practical remedy for that dust?—I do.

15,021. What is it?—To change the mode of working as I observed at first; to adopt the wedge instead of the point of the pick.

The witness withdrew.

Mr. THOMAS MORPETH examined.

15,022. (*Chairman.*) Of which portion of the Derwent mines have you the management?—What we call the lower level, or Deborah's level as it is called; that is, the low part of it. It is at Taylor's and Jeffries' shafts.

15,023. That is your particular charge?—Yes; under Mr. Remfry.

15,024. How low is that low level below the adit?—The lowest level that we have, I think, under the adit, is what we call the 95.

15,025. How many men are there working in the 95?—Only two.

15,026. What is the length of that level from Jeffries' shaft?—I cannot give you a correct answer about that. I should think 60 or 70 fathoms; but I cannot speak with confidence.

15,027. Where does it communicate with the level above?—From Jeffries' shaft we have a cross cut which goes from there to the south about 18 fathoms I should think, and we sunk on the vein there (the vein overlying) to the south about 18 fathoms. We put a sumpt down there, and the level from that I think we have driven between 60 and 70 fathoms; and that is the last communication which we had.

15,028. How far are the men now driving from the last communication?—We have only two there.

15,029. How far are they from the last communication which you have made?—I say, that from the last it is between 60 and 70 fathoms; but I only guess at that; I cannot say with confidence.

15,030. It is about that?—Yes.

15,031. How is the ventilation there?—We have not any close air there; it is very good. You may waft the candle backwards and forwards, and it will not go out.

15,032. For 60 fathoms you are away from any communication?—Yes; we have another level over above this, but we have not a communication through.

15,033. Are you putting in a rise now to that other level?—No; there is not anybody working in the other level. The prospect was very dull and we stopped it, wishing to make a discovery in the low level; and if we did so, we should put another communication through.

15,034. How long is the powder smoke getting away, when they blast at this point?—The powder smoke there, supposing they fire one hole, will, perhaps, go away in the course of 40 minutes I should think. You will see some symptoms of smoke, but not any body of it.

15,035. How soon do the men go in to work there after blasting?—I cannot say. We are not there to see them. They may sometimes go in very speedily, within ten minutes or a quarter of an hour. They are not regular about it.

HEXHAM.
Mr. T. Morpeth.
7 Oct. 1862.

15,036. Can they see to work?—Yes; they can see to work ten minutes afterwards.

15,037. But the powder smoke is not clear away for 40 minutes?—I should think so.

15,038. You have no artificial ventilation there?—Nothing different from what I am telling you.

15,039. You have no pipes taken in?—There are no pipes there.

15,040. How many shifts work in the 95-fathom level?—There are two men working there.

15,041. Do they change or shift?—They are on so much a yard.

15,042. How many men in the 24 hours work there?—Two together.

15,043. Is the bargain made with two men, four men, or six men?—Two men.

15,044. Then they only work eight hours?—Yes; eight hours shifts.

15,045. When they leave no other men take their place?—No.

15,046. So that it is 16 hours without being worked in?—Yes.

15,047. Is that necessary?—It is better for the place. At the same time we could work the 24 hours if it came to that, barring waiting 10 minutes or so at the holes. The place is very poor, and therefore I think that to have two men is as much as we can afford to do.

15,048. At the 40-fathoms level are there men working?—We have two 40-fathoms levels at the point where we have been speaking about; it is going west of Jeffrey's shaft. What we have over above that at the 40 there is no person working in.

14,049. Is there no person working in the 40?—Not west of Jeffrey's shaft. Then if you come to Taylor's there are men working.

15,050. East of Taylor's shaft?—Yes.

15,051. How many men are working in that level?—We have two men working in the 50-fathom level east of Taylor's. We have two men working also at the 40-fathom level.

15,052 Are there any other levels above that?—Yes; there is the 30. We have had two men driving towards a rise which we have been putting up. We have two men sinking and two rising; they are all in a party.

15,053. How long does the smoke take to get away from any of those places?—The smoke goes very quickly there; it is not more I should think than five or six minutes, the great body of it.

15,054. In how many shifts are the men working in the 30, 40, or 50-fathom level; do they change the party?—Where there are four they change at the eight hours; supposing they go in at six o'clock they come out at two in the afternoon, and the others leave off at 10 at night.

15,055. In each of those levels are there two in the party?—No; there are two in the 50-fathom level and two in the 40, that is what we have got east of Taylor's shaft, and there are four in the rise in the sumpt, and two driving towards the sumpt.

15,056. In all those places the air is good, the candles will burn?—The air is capital, the candle burns nicely.

15,057. Have you ever seen a place in the mine where the candle was obliged to be put on the side to burn?—Yes, sometimes, where I have had to slant the candle a good deal to get it to burn, but not of late years; since Mr. Taylor got hold of those mines they have been well ventilated.

15,058. In what manner have they been better ventilated?—By putting up rises and sumpts and giving ventilation close up to the fore-breast, and it is the way to win the ground, it proves the ground and shows whether there is ore in it or not; the men are able to give much better labour when they are well ventilated.

15,059. You have no occasion to put in artificial ventilation in any part of the mine with which you are connected?—We have not at present to my knowledge.

15,060. Where does the powder, smoke, and foul air go to?—We have different shafts; sometimes it goes up one day and the next down, the highest shaft takes the pull.

15,061. But still the highest shaft is not always the up-cast shaft?—Not always; I have seen it a down-cast.

15,062. That is when it is affected by the weather?—I think so.

15,063. Is this part of the mine very dry?—A great part of it is dry; towards Taylor's shaft is very wet, and we have got a great deal of water, but east of it is very dry.

15,064. Is there much dust in working the mine?—There sometimes is; but if miners would only adopt our plan, namely, when they are drilling their holes, to have water and something to keep the material from hitting them, there would be no dust.

15,065. Do they do that?—Sometimes; and the holes bore quicker.

15,066. Do you supply the men with the water there?—Yes; if they want water they will get it.

15,067. How do you supply it?—There is plenty of water close at hand, they will take a pail sometimes, or a bucket.

15,068. Do you supply it to them?—No, they fetch that themselves.

15,069. They fetch the pail?—Yes, they have most of those things by them; they get their powder in small barrels, and after the powder is out they have the barrel, and it is no expense to them.

15,070. Are any of the men under your charge affected in their breathing?—We have some affected in their breathing.

15,071. What is the cause of that?—Very probably there are some very old chaps, 68 years old; if a man has ever been in a mine it is possible that he will be affected in his breathing.

15,072. But you think that the young men are not affected by it?—Not that I know of.

15,073. At what age are they affected in their breathing?—Some young men are asthmatic and are affected before they get old.

15,074. Then do you think that there is nothing in the work of the mine which causes the men to be affected?—I do not say but what there is; it is not so pure as on the surface.

15,075. What is there in your opinion to affect them?—It may be the powder, rock, or something else; I cannot give you an actual answer.

15,076. (*Mr. Davey.*) Do your men work single-handed in boring?—Some do that; it is hard work, and most of them would rather be double, but by single-hand is a better way for getting labour done cheap.

15,077. Do you approve of the single-hand work?—Yes.

15,078. Do the men generally bore the holes dry?—No; when they are single-handed there is often water.

15,079. (*Mr. Kendall.*) What do your miners generally pay a week for their lodgings?—I believe you find different prices; 9*d.* I believe.

15,080. Do they crowd much into the rooms, or have they generally good, nice, airy lodgings?—I dare say that they will have pretty comfortable beds, and that they are not much crowded.

15,081. Are they as a body of men sober or not?—Some of them are not sober and others are very sober steady men.

15,082. Do any of them save much money?—I cannot say positively whether they do or not; I do not know their affairs.

15,083. Do they marry early or not?—Some marry early.

15,084. Taking them generally speaking do they marry earlier than the agricultural labourers?—No; I cannot say that.

15,085. With regard to the wages, do you make any difference between the wages of the married men and the wages of the single men?—It makes no dif-

ference to us, we let all the bargains as nearly as possible alike, and they may make what they can; it is no matter whether a man is a married man or a single man.

15,086. According to his worth so he has his money?—Just so.

15,087. What are the average wages?—I think the average wages this last month have been about 15*s.* 2*d.* a week at this low level, or 15*s.* 2¼*d.*

15,088. You do not know the agricultural wages here do you?—I do not.

15,089. I suppose taking the miners as a body you do not consider that they are quite as healthy as the agriculturalists?—No; I do not think that they are.

15,090. But taking them as miners do you think that the ventilation is about as good as can be made in your mine?—I think that it is so; if we go a certain distance we give another communication through; wherever we find the air getting dull we consider it better to do so we can get a great deal more labour done; if a man is working in a bad air place he is not able to give much labour.

15,091. Is the health of the men generally good?—Yes.

15,092. Have you worked in any other mining district than this?—No; I have wrought in this mine I think about 54 years, working and agent together.

15,093. You cannot compare your miners with the miners of another district?—No, I cannot.

12,094. Have you improved much in ventilation in your mines since you have been an agent?—Yes; we have made much improvement.

15,095. The ventilation now is better than it was ten years ago?—A great deal.

15,096. And ten years ago it was better than it was ten years before that?—I dare say.

15,097. Then it is possible to improve it a little more still?—I dare say it is.

15,098. (*Mr. Holland.*) What improvements have been made in the last ten years in ventilation?—By putting more shafts down and putting what we call sumpts, that, is a communication between levels; we put the communications between which causes a draught of air to work from one place to another.

15,099. Anything else?—No.

15,100. Are the levels any wider than they were?—Yes; I think that since Mr. Taylor took hold of it they are wider levels than they were formerly.

15,101. Are they any higher?—I think they are a foot higher some of then.

15,102. And how much wider?—From six inches to a foot.

15,103. And are they shorter between communications?—Yes.

15,104. Does the powder smoke hang less now than it did?—Yes; much less, that is the case when there are more sumpts and more shafts.

15,105. What difference of time is there in the hanging of the powder smoke from what there used to be ten years back?—I do not recollect; it depends a vast deal upon the place.

15,106. What was a common time for the powder smoke to hang ten years ago?—It just depends upon how the weather is; there may have been some places in that time where it would be nearly all day; supposing they went in at 6 o'clock, and fired, it might remain until 2. They may now get in in ten minutes, and sometimes less.

15,107. Is it a very unusual thing for powder smoke to hang an hour now?—Yes; at the same time you may smell it, and say that there has been powder.

15,108. It hangs about sufficient to smell, but not sufficient to prevent working?—Yes, but there is nothing to do any damage.

15,109. Are you sure that there is very much less powder smoke in the mines now than there was ten years ago?—Yes, I am confident that there is much less now.

15,110. Very much less?—Yes.

15,111. Has there been any improvement in the health of the men in the last ten years?—Yes, there must be, I think.

15,112. Have you noticed that there is?—Yes, I believe that they are a good deal better.

15,113. Is there a decided improvement?—Yes.

15,114. Are they less touched in their wind than they were ten years ago?—They are not touched so much as they were ten years ago.

The witness withdrew.

REFORM CLUB
PALL MALL

Mr. JOHN MADGIN FARBRIDGE examined.

15,115. (*Chairman.*) You are a medical man?—Yes.

15,116. Resident where?—In Blanchland.

15,117. Have you the charge of any mines?—The Derwent Company's mines.

15,118. How long have you had charge of them?—19 years next Christmas.

15,119. Have you observed during that time any particular disease by which miners are peculiarly affected?—Diseases of the chest.

15,120. Is that in your opinion occasioned by the description of their work?—Yes, to a certain extent.

15,121. Can you state shortly the symptons of that disease to which the miners are more liable?—Bronchitis, difficulty of breathing, more particularly upon any exertion.

15,122. Cough?—Cough with expectoration.

15,123. Is that expectoration coloured?—Frequently.

15,124. (*Mr. Holland.*) Is it black spit?—It is more of a lead pencil slate colour.

15,125. (*Chairman.*) Have you ever known instances where it has been vomited?—Not unless there was general vomiting from the stomach; but an excess of cough creates vomiting.

15,126. Then do they expectorate that?—Yes; and it does them good.

15,127. It relieves them?—It relieves them very much.

15,128. Have you ever seen a case where after a man has left off work in a mine for some time, that coloured expectoration has continued for some time?—Yes, generally so.

15,129. Did you ever have a post mortem examination?—Not in this country.

15,130. (*Mr. Holland.*) It is quite certain that this miners' complaint is distinct from common phthisis, is it not?—It frequently terminates in phthisis.

15,131. Is it quite distinct from common phthisis?—Yes; it is lead asthma.

15,132. You mean lead miners' asthma, do not you?—Yes.

15,133. To what causes do you attribute it chiefly?—The principal cause is the under surface working.

15,134. What immediate effect has underground working upon the health, is it the dust?—Principally.

15,135. Do you think that the smoke has much to do with it?—Yes.

15,136. The candle smoke or the powder smoke?—The gunpowder smoke.

15,137. More than the candle smoke?—Yes.

15,138. Is the disease very slow in its progress?—Very slow.

15,139. Does it come on very gradually?—Very gradually indeed.

15,140. At about what age do you see it at first?—Generally between 35 and 40.

HEXHAM.

Mr. J.M.Farbridge.

7 Oct. 1862.

15,141. Not generally before 35 or after 40 ?—Not unless the miner is predisposed to consumption.

15,142. I am now speaking of miners' asthma, that seldom comes on before 35 ?—Yes.

15,143. And generally before 40 ?—Yes.

15,144. When do they generally become very ill with it; is it several years after its commencement before they become very ill ?—Few miners are able to work after 50.

15,145. Is that the case at the present time as it was some years ago ?—Yes.

15,146. We have been told that the miners are much more healthy than they were ten years ago ?—I think so; that is from the improved mode of ventilation.

15,147. Is ventilation improved generally in the mines ?—I think that in our district it is.

15,148. Does this complaint come on at a later age than it did ten years ago ?—I have not noticed that.

15,149. I thought you said that the miners were more healthy than they were ten years ago ?—Generally so.

15,150. Then one would expect that the disease would appear later in life than it did, have you not noticed that ?—There are many exceptions to it.

15,151. Do they cough a good deal before the expectoration becomes free ?—The old miners do.

15,152. When the disease first commences does it commence with cough ?—Yes.

15,153. Does the cough continue some time before the expectoration becomes free ?—Yes.

15,154. A good while ?—Yes; it is difficult to expectorate.

15,155. They do not rapidly become thin, do they ?—Not rapidly.

15,156. They do become thin, I suppose ?—Yes.

15,157. Is it accompanied with hectic fever ?—Not until the latest symptoms; when it is very much advanced.

15,158. Is it accompanied with hæmoptisis, the spitting of liquid blood ?—Frequently; but that is where there are tubercles in the lungs; where it is complicated with phthisis.

15,159. That is where the two complaints are combined ?—Yes.

15,160. Have you ever seen the spitting of liquid blood when you have had no suspicion of tubercles ?—Not often; idiopathic active hæmorrhage is very rare indeed.

15,161. Have you ever seen it ?—I have seen it in one case.

15,162. Distinct hæmoptisis ?—Yes.

15,163. Is not hæmoptisis without tubercles very rare ?—It is generally a precursor of consumption; it is generally a symptom of tubercles.

15,164. I was asking whether hæmoptisis was not a very rare symptom in pure miners' consumption as distinct from phthisis; am I right in that, or have you not noticed that ?—I cannot see much difference between ordinary consumption and miners' consumption; I suppose consumption is merely wasting away.

15,165. Did you not say that miners' consumption is much slower in its progress than common consumption ?—Very much slower.

15,166. And much less accompanied with hectic ?—Yes.

15,167. And that there is much less frequent spitting of blood ?—Yes.

15,168. And much less rapid wasting ?—Yes; it is more gradual.

15,169. As regards physical signs, is it not much less confined to the upper part of the chest ?—It is more in the bronchial tubes.

15,170. Is not the formation of cavities in miners' consumption rare ?—It is not the case until it gets to an advanced stage; there are no cavities until the latter part of the complaint.

15,171. Cavities are not common in miners' complaint are they ?—Yes; in the latter stage.

15,172. Is solidification of the upper part of the lung frequent in the early stage of miners' consumption ?—It is frequently so, but not in the early stage.

15,173. In the early stage ?—Not always in the early stage.

15,174. Is it not rare ?—It is rather rare in the early stage.

15,175. If miners change their employment and work above ground, do not they keep pretty well for a long time ?—Yes they live much longer.

15,176. Though they do not quite recover they cease to get worse ?—They cease to get worse.

15,177. Is that common in phthisis ?—Not in ordinary phthisis.

15,178. Do you not think that those are strong marks of distinction between miner's consumption and common consumption ?—You cannot say that a miner ever gets completely well.

15,179. You have had no opportunity of dissection have you ?—Not any.

15,180. There is a great prejudice against it ?—Very much indeed.

15,181. I suppose that there is a very marked excess of this disease among miners over any other portion of the population, is there not ?—Decidedly.

15,182. Twice or three times as much, or more than that ?—A great deal more than that; ten to one.

15,183. (*Chairman.*) You have spoken of lead asthma; are men affected in that way who work at the smelting works ?—No.

15,184. (*Mr. Holland.*) I think you meant lead mine asthma ?—Yes, miners' asthma.

15,185. (*Chairman.*) When the men come to you do they complain or imagine that they have got their illness from any work in which they are engaged ?—Frequently they do.

15,186. What do they complain of generally ?—Cough and shortness of breath.

15,187. Do they consider that they have got it from working underground ?—Yes.

15,188. From working in any particular level ?—Yes, frequently.

15,189. What do they complain of in that level as affecting them ?—The deficiency of pure air.

15,190. Do you recommend them to go back to their work or to abstain from their work ?—I recommend them to keep out of it as much as they can; they generally go back.

15,191. If such a man goes back to the work do you think that there is any injurious effect ?—Yes, I do.

15,192. Have you ever known any man once affected recover completely ?—If they were young and left when the first symptons made their appearance and went to another occupation they got better.

15,193. But if they have gone back to the mine, what has been the consequence ?—An increase of the disease.

15,194. How long do you think that a man could work in the mine after he was so affected before he was obliged to give up altogether ?—They generally give up before 50; it is an exception to get up to 50.

15,195. At what age have those whom you have seen generally been obliged to give up their work ?—Between 40 and 50.

15,196. Have you any cases now which you could name to us of men who are working in the mine who still are affected ?—There are some here whom you will see to day.

15,197. Are those patients of yours ?—No.

15,198. Have you any patients of yours now working in the mine ?—I have.

15,199. About how many should you say ?—About half a dozen.

15,200. Do you mean working in the Derwent mine ?—Yes; I am connected with no other mine.

15,201. Do you keep any record of the cases which come under your notice ?—No.

15,202. Are the names of the men not put down in any book ?—No, I do not keep any account, with the

exception of giving them certificates for their relief when they are off work.

15,203. How many certificates do you suppose you have given in the last month ?—I do not know exactly ; perhaps six or seven or eight ; I cannot say ; I do not keep an account.

15,204. Can you give us the names of those men ?—I should think that the bulk of those who got certificates for the last month have gone to work again ; they are not under medical treatment ; as soon as they go to work they cease to be under my treatment.

15,205. Have you any miners now who are off work altogether and are under medical treatment for miners' disease ?—Yes.

15,206. Do you know about how many ?—I know of three.

15,207. About what age are they ; are they old men ?—Somewhere about 50.

The witness withdrew.

Mr. THOMAS BELL examined.

Mr. T. Bell.

15,208. (*Chairman.*) Have you always worked in the Derwent mines ?—Yes, always. I wrought for 45 years for one company in these mines, and I never had a shilling under any other in my life.

15,209. You are affected now in your breathing, are you not ?—Yes, but I am working at my bargain. I walk nearly three miles to labour in the morning between my place and the mines.

15,210. Is it in a wet part of the mine that you are working ?—Yes ; it is so now.

15,211. Do you change your clothes when you come out of the mine ?—Yes.

15,212. Where do you do that ?—At the dry that we have convenient to the mine.

15,213. Do all the men change their clothes there ?—No ; they do not. Only the men who are wet change their clothes there. The others go to their own homes.

15,214. From what cause do you suppose you became affected in your breathing ?—I cannot say. There is many a one affected that has never been in a mine.

15,215. Have you not sometimes worked in bad air ?—There is a difference in the air, but there is a stour that will come out that will affect your breathing when you are drilling. That will arise from the stone, and that affects the wind.

15,216. Do you get much of that into your mouth while you are working ?—No. We do not find that much.

15,217. Do you not spit it out if it gets in ?—Yes. We spit it out, a part, or else we should soon be done, but not all at the time we are working.

15,218. How long does the spitting continue after you have left off working ?—Not long ; we get clear of it when we get home.

15,219. Are there some men younger than you who are affected in the same way ?—I dare say they will be.

15,220. Do you happen to know anyone now who is working in the mine whose breathing is affected, and who is under 50 years of age ?—I do not know one. I cannot name one.

15,221. Did you ever work in bad air ?—Yes. I have wrought in all kinds of air.

15,222. Did you ever work where you were obliged to put the candle on one side that it should keep alight ?—No. I never would go there ; that is not a place for a man to work in, that is where the damp strikes in.

15,223. The men sometimes do work in that, do they not ?—They do, but they had better have gone home.

15,224. But they sometimes work in it ?—They cannot when the candle is that way. They cannot work in the mines in that way ; they cannot bore their holes you see, and they cannot breathe.

15,225. How long is the smoke clearing away where you are working now ?—The wind is like to blow your cap off your head. It is going directly near where we are working now.

15,226. In some places does the powder smoke hang about a long time ?—Yes ; but there is a difference of places ; it depends upon how they are ventilated at the mine.

15,227. If you are putting in a rise will not the smoke remain there until the rise be carried up to the upper place to which it is going ?—The smoke will hang there till she be through.

15,228. How long will it hang about there ?—I cannot say. There are different places for that.

15,229. How long have you seen it hang about ?—I am sure I cannot give it a name.

15,230. Have you seen it hang about for half an hour ?—Yes, and then we smoke our pipe till it gets off.

15,231. Then you go and sit down and smoke your pipes for half an hour till it clears away ?—Yes, when we are in places like that.

15,232. Do you ever have to smoke for an hour ?—I hardly know that ; I will not say that. We work by measure ; we must have our measure.

15,233. (*Mr. Davey.*) Has there been any improvement in the ventilation within the last 10 years in the Derwent mines ?—They are well ventilated.

15,234. Has there been any improvement or is the ventilation better now than it was 10 years ago ?—I do not know. I have been in it for 10 years, and I think it will be improved. There are some levels getting forward and shafts sunk and things of that sort, but they are not like a coal pit.

15,235. You have more winzes and rises through the levels than you have in a coal pit ?—Yes ; and we have good ventilation that way.

15,236. Where you used not to have ?—Yes. We are underneath ; it used to be all up and down, but we get underneath now. We work up now. It used to be formerly down and lifting the work up, but now it falls down where the shaft is being sunk down deeper. It used to be to lift up by hand to the shafts. They have become quite improved in my time.

15,237. You say that you suffer a good deal from the dust in boring ?—Yes.

15,238. Why do you not put water into the holes ?—In every situation you cannot do that. When you are boring upwards you cannot put water in.

15,239. Do you usually put water in if you are boring down ?—Yes ; not always, but nearly so, for our own convenience. We can bore as fast again with water.

15,240. (*Mr. Holland.*) Is it common for the miners to suffer from the same disease that you have ?—I dare say it will be.

15,241. Do you not know whether it is so or not ?—I do not know for all men. I have seen some.

15,242. Is it common for a man below the age of 40 ?—I cannot say the age. I had nothing of it at 40.

The witness withdrew.

Mr. GEORGE DENT examined.

Mr. G. Dent.

15,243. (*Chairman.*) Where are you working now ?—In the Derwent mines.

15,244. How long have you been working there ?—I have wrought for 36 years in there.

15,245. How old are you ?—I was 50 last January.

15,246. Are you at all affected in your breathing ?—Yes.

HEXHAM.

Mr. G. Dent.

7 Oct. 1862.

15,247. How long is it since you have been so affected ?—As near as I can say, about six years.

15,248. How did it first come on ?—Something similar to asthma.

15,249. Did it come on with a cough ?—Yes.

15,250. Have you taken any cold ?—No ; it was not by cold. It was just something like cough, as if I had some phlegm that I wanted to get rid of. After that you feel more freely to breathe.

15,251. Can you at all explain how it was brought on ?—I cannot explain that ; but I had what I thought a reason, I may be wrong. But I was working in an end where all the draught of air was coming, and all the men were working before us, and the smoke all met us in the face I had been working in a place before which our master considered the worst place in the mines. I did not feel affected in it ; but after we came to the place I have mentioned, where that smoke met us and the dust, I felt that it affected me.

15,252. Was it considered the worst place on account of the bad air in it ?—Yes ; it was what we call bad air. There was no communication to it ; it was a rise that we were putting up to cause air.

15,253. When you are putting up a rise the air is bad, is it not, until you effect a communication ?—Of course, it must be.

15,254 When that is the case, does the candle burn badly ?—Very poor ; we have to keep it in by holding it slanting.

15,255. Must that always be the case when you are putting in a rise, or sinking ?—It is not always the case ; it sometimes happens that the air cannot be got by the boxes, and sometimes we get a water-blast. Sometimes there is a little machine, something like what we call a fan-blast, and that is used to get air to us.

15,256. When there is nothing used, the air is bad ?—Yes ; it is very bad. We had a fan-blast in that place, but there was no good air. When that fan-blast was put there, the air that came was not good.

15,257. It is important, is it not, that the fan-blast should always be where the air is good ?—Of course ; but it cannot always be got.

15,258. Could they not put in a water-blast ?—Sometimes they cannot, and sometimes they can.

15,259. They have not always water ?—No ; and they have not perhaps a convenience for getting that water away when there is no pumping machine, or else the water-blast is the best, decidedly.

15,260. Have you often worked in those rises where the air has been bad ?—I have worked in three that I remember, which were considered the worst in our mines. I have wrought in what we call plate drifts, and they are the worst for affecting the wind. I worked for four years there. They are what might be termed wet.

15,261. And did not that affect you at all ?—Not in that day. I was younger then.

15,262. Did it not produce any unpleasant sensation at the time ?—Yes, it did, because the plate dust lies more heavily upon you than any other dust, and after you get out you feel that there is a general clogging in your breast, till after a little exercise, and then you get rid of it.

15,263. Did it affect your knees at all, or your head ?—The head is generally affected if the air is poor, and so are your knees.

15,264. Do you walk out by the level from the mine, or have you to climb up ?—The general way in our mines is climbing, in the part of the mine that I work in.

15,265. What is the greatest distance that you have to climb now ?—100 fathoms.

15,266. Does not that affect you very much ?—Yes ; but I go there every day, notwithstanding.

15,267. How is the ore taken out from there ?—It is taken out by machines. The water-machine draws the ore.

15,268. There is no machine for the men to go up and down by ?—No.

15,269. There are only ladders ?—No.

15,270. Are the ladder-ways separate from the air shaft ?—They are both ways in our mine. We have one at one part of the mine, and that is the engine-shaft, and we have a separate footway by the side of the drawing shaft.

15,271. Are the ladder-ways separated from the drawing shaft ?—Yes.

15,272. How are they separated, by wood ?—The drawing shaft does not come into it at all, but in the pumping shaft they are separated.

13,273. Is the footway separated by a brattice ?—They are not separated by bratticing entirely all down, but there is one part in the mine, a new one that they are making now, where they are making an entire separation ; there is a brattice all the way down for the footpath. I am what they call woodman to the mine ; I am in all parts of the mine.

15,274. You do not now work as a miner ?—No.

15,275. I suppose you could not perform the labour of a miner ?—Yes, and do the same thing as ever I did ; as to following the waggons to the tramway, that I suppose I could not do, I am too short in the breathing ; but we say generally that it suits the young men.

15,276. Is any place to be seen now, where the miners are working, and where the candle has to be put to the side ?—Not in the part of the mine that I work in, or not to my knowledge ; there might be a place.

15,277. Have you the charge of all the timbering in the mine ?—Yes ; there is another man with me in my part.

15,278. Is there a man whose business it is especially to look after the timber ?—There is a masterman, and he is in every day, and he directs us ; we have a special order from him, that if we see any failing to go direct and put it to rights.

15,279. What are the lengths of the ladders ?—They vary all the way from 12 to 18 feet.

15,280. At the bottom of the ladders, is it boarded over ?—Yes, and made all quite close, there is just a hole so that a man can go through.

15,281. (*Mr. Davey.*) Is it at Jeffery's shaft that you work ?—No, I do not work there ; it is called Ramshaw shaft.

15,282. If you come up from underground, there is no necessity to go up direct by the footpath ; cannot you go up through the winzes ?—We can ; but still we must have climbing.

15,283. But not continuous climbing ?—No, not straight up.

15,284. Do the men generally come up by the shaft, or by those winzes ?—That just depends upon how the men are working ; in the part where I am our pumping shaft goes down, and she is driven away some 100 or 150 fathoms from that, as near as I can say. I do not say that it is exactly so, because I never measured it, but it is about that ; from that we have a drawing shaft, and then she is driven away from that again. There are drifts to come back to the stepways or footways ; but we always go to the footway or out at the engine-shaft at Ramshaw.

15,285. Are you a native of this place ?—No, I came from the south when I was six months old ; I came from Yorkshire.

15,286. Do you consider that any improvement in the ventilation of the Derwent mines has taken place within the last 10 years ?—I think there has been some improvements ; I have wrought in them all my life, and I never worked for any other company.

15,287. Had you more men ill 10 or 15 years ago than you have now ?—I never knew the men very much affected in our mines ; after they come to my age they are all more or less affected.

The witness withdrew.

Mr. THOMAS WARE examined.

HEXHAM.
Mr. T. Ware.
7 Oct. 1862.

15,288. (*Chairman.*) Are you the manager of mines in this district?—Yes.

15,289. What are their names? — Stone Croft and Grey Side.

15,290. Are they lead mines?—Yes.

15,291. How many men do you employ underground?—About 60.

15,292. About how many men are employed altogether upon the mines?—We have about 130 men and boys.

15,293. Do you smelt the ore?—No.

15,294. How are the other men employed on the surface?—In dressing the ore; some are smiths, engine-men, and labourers.

15,295. How do they enter the mine?—At the adit level.

15,296. How deep is the mine below the adit level?—About 30 fathoms, that is our deepest working.

15,297. What is the length of the longest level?—Our longest level is about 400 fathoms.

15,298. Are there shafts from that level to the surface?—There are two main shafts.

15,299. How far below that longest level are you working?—About 14 fathoms.

15,300. About how many levels are there?—We have four levels.

15,301. Are they all working now?—No, we only work two of them.

15,302. Are they the two lowest ones?—Yes.

15,303. How many men are working in the longest level?—About half of them, between 20 and 30.

15,304. How do the miners go down, by ladders?—Yes, and they come up by climbing.

15,305. From the adit level?—Yes.

15,306. How is the ore brought up?—By steam power and cages.

15,307. Is it brought to the surface, or only to the adit level?—It is brought to the adit level in waggons, thence to the dressing floors by horses.

15,308. Do you let your bargains by the month or by the quarter?—By the month, so many fathoms or a month.

15,309. Have you any tribute-men?—No.

15,310. In paying the men do you keep so much in hand?—We keep a week in hand until we can get our accounts made up.

15,311. Is there a doctor attached to the mines?—No; we have no doctor.

15,312. Is there any club money paid?—No; I have tried the men, and have brought that matter before them several times, but they do not seem to see the benefit that would arise from it, and we do not like to enforce it.

15,313. What allowance of candles is made to the men?—We do not allow them more than 2 lbs. a week; some of them do not get more than a pound and a half, just what they look for.

15,314. What do they pay per pound for the candles?—6*s.* 6*d.* a dozen pounds; sometimes 7*s.* We charge them just what we contract for. If they are high we charge 7*s.* a dozen pounds, if they are lower we charge them less.

15,315. What do you charge them for powder?—16*s.* for what we call a quarter barrel of 25 lbs.

15,316. Does that vary according to the contract price?—Yes.

15,317. Do the miners pay anything for the sharpening of their tools?—No; we do not charge anything for that. We provide the tools, and they pay for short weight. They are weighed in once in two months, and we deduct for short weight.

15,318. How many shifts do they work in 24 hours?—They reckon to work five in a week.

15,319. But I mean in the course of 24 hours, do they work in two shifts of eight men?—We work three eight-hour shifts in some places.

15,320. Do they work at night?—Yes.

15,321. Is a bargain let to six men?—Yes; to six, and to four men; it depends upon the place. In what we call ends we work with six. The stopes or head ends, which is the term here, we work them to the best advantage, sometimes two and sometimes four.

15,322. Are there any places where you are obliged to provide artificial ventilation?—In some places we have a fan-blast, that is, at two places, and they are worked by a water-wheel.

15,323. Is the air carried in wooden or in iron pipes?—In iron pipes. We have at one part wooden pipes for a short distance, but not long.

15,324. The fan is worked by a water-wheel?—Yes.

15,325. Do you find that that is quite effectual?—Yes.

15,326. How soon does the powder smoke clear away when that is at work?—It depends partly upon the weather at the surface. In very hot weather it does not get away so fast, when there is not much of a breeze outside.

15,327. Is one shaft always up-cast, or does it vary?—It varies; sometimes it is down cast. It depends partly upon the wind and the weather outside. It is not always an up-cast.

15,328. Is the one shaft that is up-cast any higher than the other one?—Yes.

15,329. But that does not ensure its always being an up-cast?—No; but generally speaking that is the up-cast shaft.

15,330. Are there any men working in the mine who are at all affected in their breathing?—No; ours is only a young mine. It was commenced in 1851, and we have not many old miners; they are generally young men.

15,331. Have you ever worked in a mine in Devonshire?—Yes.

15,332. Have you worked in mines in Cornwall?—No.

15,333. In what mines in Devonshire have you worked?—In Devon, Great Consols, and Old Wheal Friendship.

15,334. How long have you had the management of these mines?—Going on six years.

15,335. Have you any Cornish men working in your mines?—We have had some, but none at present.

15,336. Are the men who work in the mines mostly from this district?—Chiefly from Allen Heads, and round about the neighbourhood.

15,337. Do they live near the mines?—Some of them, and we have some of what they call wallet men, that is, men who carry wallets, from Alston and Allendale; and some of them come from Haydon Bridge, a distance of three miles.

15,338. Have you any shops for them?—Only one.

15,339. Where do the men who carry their wallets put up?—At the cottages. The people take them in at so much a week; they pay so much for four or five days; a great many of them try to get away on the fourth day. They all get away on the Friday, and sometimes they get away on the Thursday night.

15,340. Is that in violation of their bargain?—Rather. When I first came there the afternoon and night men worked but four shifts a week; but now they work five, some of them, but not at all times.

15,341. Do you not think that there is rather a want of cottages near the mines?—I do not know; I have built some cottages, or rather the company have. They built two, and we have had a great difficulty in letting them; the men prefer going elsewhere.

15,342. Have any of those men who come from a distance a piece of land and a cow?—I believe they have a piece of land and keep a cow; some of them I know have.

15,343. Probably that is the reason why they will not reside on the mine?—Yes; I think that that is partly the cause of it.

15,344. Is your mine at all wet?—No; although

HEXHAM.

Mr. T. Ware.

7 Oct. 1862.

we have a great quantity of water to pump the workings are not wet but very dry indeed.

13,345. Have any accidents occurred from blasting ?--Only one, about a year and a half since ; we tapped a large quantity of water and we were drowned out for six or eight months ; the workmen's tools were left underground; we do not use any safety fuze, and the pricker that was left in got corroded ; the men did not bring it out to have it filed down and made smooth. I attribute the accident to that, in putting in the powder and rubbing it against the side of the rock which caused the powder to ignite from the roughness of the pricker.

15,346. Was it an iron one ?--Yes.

15,347. If it had been made smooth you do not think the accident would have happened ?--No.

15,348. Do the men use a straw ?—A paper match generally ; some of them use a straw.

15,349. (*Mr. Davey.*) Are the cottages very much crowded where the men obtain their lodgings ?—I have not examined them ; but I know that some of them must be crowded from the number of people they have ; our own cottages are not so much crowded.

15,350. But are the cottages where the men are taken in as lodgers crowded ?—Yes ; some of them must be crowded.

15,351. Do the men have separate beds ?—I think some of them sleep two in a bed, and upon occasions I have known them to sleep three in a bed.

15,352. In making shifts does one party get out of bed and the other turn into the same bed ?—I cannot answer that question ; I do not know ; I have heard them talk of sleeping three in a bed.

15,353. (*Mr. Kendall.*) Do you know what they pay for their lodgings ?—In some places 9*d.*, in others 1*s.* a week, which is the highest.

15,354. What is done for them for that 1*s.* ; do they get their washing done ?—Nothing at all ; they have to cook their own food.

15,355. As far as you have observed is the ventilation good in your mines ?—Yes ; I consider it good; there are some places that you cannot ventilate when you are sinking sumpts and winzes to ventilate a place; you will occasionally have a place that is bad.

15,356. Have you had a place that was had lately ?—We have one that is not very good just now.

15,357. In what part of the mine is that ?—I have a plan here upon which I will show you (*pointing out the same*).

15,358. At 35 fathoms from the adit level going west the ventilation is bad ?—Yes.

15,359. How far must you drive before you effect a communication ?—From eight to nine fathoms.

15,360. Before you can communicate you will have to drive over 40 fathoms ?—Yes.

15,361. How do you send the air in to the men who are now working at that end ?—It comes up from the adit level.

15,362. As I understand you, a great portion of the 35 fathoms is already worked away ?—Yes ; we are obliged to work it whether it is good or not to ventilate to a certain extent ; there is a little ore in it.

15,363. Is it bratticed at all ?—Yes ; it is boarded.

15,364. It is sollered over to within about 12 or 14 fathoms of the end ?—Yes.

15,365. And notwithstanding that the ventilation is bad ?—It is not bad, and it is not good.

15,366. Are the men obliged to hold the candles on the slope ?—No, not at all ; the candles burn upright.

15,367. How many men are working at a time ?—Two men at a time.

15,368. How many shifts have you ?--Three.

15,369. Are you sinking a winze at the same time from the 15 fathoms ?—Yes.

15,370. How far down is it ?—Between three and four fathoms.

15,371. How long will it be before you hole ?—Between three and four months.

15,372. Shall you use any fan ?--We have not put in any yet ; and unles it gets worse we shall not put in any.

15,373. Do the men appear to suffer when they come out, do they complain ?—Sometimes they do.

15,374. It depends upon the state of the atmosphere, does it not ?—Yes. I have heard them complain occasionally, but not often.

15,375. Do you observe anything in their looks indicative of suffering on their part ?--Nothing more than in the other men.

15,376. Are they young men, generally, or old men who are there ?--Young men generally ; some of them are about 35.

15,377. Is that the result of accident, or do you choose them ?--No. We take them as they come.

15,378. Would the older men refuse to work there ?—No. I may have two or three that I have taken on recently just to give them bread, who might object to going there. Some very old miners, who are not able to do much, might object to going in ; but in fact I would not put them into a place of that kind.

The witness withdrew.

Mr. JOSEPH DENNING examined.

Mr. J. Denning.

15,379. (*Chairman.*) Do you reside in this district ?—I reside seven miles west of this place.

15,380. Have you the charge of some smelting works ?--Yes.

15,381. Are you acquainted with the mining district about this neighbourhood ?—Yes. I think generally, very much indirectly. In some cases directly. I am principal lessee of one pretty extensive mine in Alston Moor. I am also a partner in another of rather an extensive character, but my business necessarily leads me into direct communication with the lessees of mines in Alston Moor and the district generally, in the way of buying ores.

15,382. Do you ever go underground ?--Occasionally, in my own mine. I do occasionally ; once a quarter or once in six months, as the case might be.

15,383. Are the mines to which you refer all lead mines ?--Yes. I am also a colliery owner.

15,384. In the mines which you are referring to have you observed that the men working in them suffer at all ?—I think not ; not generally. Of course I do believe that they sustain more or less injury. I do think that.

15,385. Do you think that they sustain more injury than from working in coal mines ?--Yes, I think so.

15,386. In what way do you think the miners are injured ?—I presume that it arises from impure air and from the nature of their work ; that is, from the dust that necessarily arises from drilling the holes, and from the nature of the work generally, from its dirty character. Of course they cannot stir the material, as it is like all matter, without making more or less dust, and that being necessarily inhaled into the lungs will do them injury. Generally speaking, you find the miners a little injured in their breathing, and even young men, who I fancy are not predisposed to it, but they become so from the nature of their work.

15,387. At what age do you think the miners generally become so affected ?—I fancy that if they work for a few years they will become affected. Indeed I know several young men, or at any rate men of about my own age, that are almost breathless. They cannot walk scarcely 100 yards without being affected, and of course they attribute, I fancy, that defect in their breathing most particularly to the nature of their employment. Six or nine months or 12 months are quite enough to work in one of these bad places to produce that result.

15,388. I suppose working in bad places means

driving an end or rise without much air?—Yes; without having proper ventilation.

15,389. Is it not necessary when driving in order to effect a junction with two levels to get ventilation?—Yes; that is done occasionally of course, but where there are other mechanical contrivances wanting they are obliged to do it.

15,390. Are the miners paid more for performing their work under those circumstances?—There is no mistake about that. The men must have more wages for fewer hours and less labour.

15,391. When they are driving any of these close fore-ends they are paid more and work less?—Decidedly so.

15,392. That is rather an inducement, is it not, for the young men to undertake that kind of work?—I presume that for the most part, young men are put to that kind of work; indeed, it is generally work that is done in an emergency, and they employ young men upon it in order to expedite the work, at least that is I think the general object for putting them upon it.

15,393. They do that work to the injury of their health?—Yes, sometimes people are, and in fact you find it frequently so, careless as to these consequences.

15,394. In Alston Moor are there any of these places where they have driven?—I think not, not particularly; I could not mention one instance specially, but I fancy that that sort of thing occasionally arises in many of the mines in the district; but at the same time I presume, as far as I know the disposition of the parties, that they do their utmost to remedy that state of things.

15,395. When they are sinking deeper, is there any alteration made in the dues; is there any reduction made in consequence of these deeper workings?—Yes, very recently here in this district, a reduction has been going on over the last few years, but more generally in the last two years, and that was given in consideration of their putting a larger proportion, or at least a certain proportion, of men underground by way of making new trials; for, it is generally understood I think, in the district of Alston Moor, that the veins are about exhausted, so far as the veins that have been already discovered go, that they are pretty well worked out; and now they are making efforts to get down deeper, and of course the deeper down they go, the worse ventilation there is; and until the excavations are made below, so as to produce a proper communication backwards and forwards with the air, the men will necessarily suffer more or less.

15,396. The men, I presume, are likely to suffer still more, the deeper the excavations are made?—Unquestionably; but at the same time they are not deep mines.

15,397. The levels are driven in a long way from the air, are they not?—Yes.

15,398. I suppose you have seen artificial means of ventilation resorted to?—Yes, we have occasionally used them.

15,399. What kind of artificial means should you recommend as the best?—Either water-blast, or fan-blast, either of them.

15,400. Do you mean a fan-blast worked by a water-wheel?—Worked both by hand and by a water-wheel.

15,401. Is the hand fan-blast as efficient as the other?—It entirely depends upon how far you want to convey the air.

15,402. How far can you convey it by the fan-blast?—I fancy it can be conveyed 300 or 600 yards.

15,403. Is there any difference whether you send the air in wooden or in iron pipes?—There is a sort of tin pipe that is generally used in our district; but I think that wooden boxes are a still more general practice.

15,404. Are there any iron pipes used?—Yes, but they are not of such general adoption; the others come cheaper, and answer the same purpose, or they are something like the same thing.

15,405. Are there any peculiar accidents incident to the mining as carried on here?—They are very rare I think.

15,406. Not from the falling of the earth or the roof?—I think that the mines are generally conducted on safe principles, every precaution I think is used, and when an accident has occurred it has generally arisen from some carelessness or from some uncontrollable and unforeseen circumstance.

15,407. The miners are not, from the nature of the ground they work in, peculiarly liable to accident?—Not at all; of course it is a rock, and they generally should leave sufficient strength in the galleries; but of course the nature of the labour is of a dangerous character.

15,408. In the instances where the works have been abandoned, are the shafts closed up?—That is not I dare say universally done; but there was a case that occurred in our neighbourhood about two years ago of a man who was not perhaps of the most temperate habits; the bargain days came round once a quarter or six months, and on a bargaining day this man along with his partners came to take his bargain, and upon such occasions he sometimes got upon what they call a spree; he was overtaken by drink, was away from his home for three or four days; enquiries were then made for him, and he was found at last at the bottom of a shaft dead.

15,409. Was the shaft unprotected, that even a sober man might have fallen down it?—I cannot speak to that, for I did not see it.

15,410. (*Mr. Kendall.*) Is it customary or not in this country to leave the shafts open?—They are left open for the purpose of forming a communication between, perhaps, a newer working and an older one.

15,411. Is any guard or fence put round them?—It was not so in the case I have referred to; but, generally speaking, there is.

15,412. There are instances, I suppose, of carelessness in that respect?—I presume so.

15,413. (*Mr. Holland.*) Are the shafts fenced round generally?—They are walled round generally. A masonry wall is put round the shaft top; if not, they put wood across.

The witness withdrew.

Mr. GEORGE HENDERSON examined.

15,414. (*Chairman.*) What is the name of the mine of which you have charge?—Fallowfield.

15,415. Is it an extensive mine?—Not very extensive.

15,416. How many men are there employed underground?—About 50 pickmen, besides other labourers.

15,417. How do the men enter the mine?—They have a climbing way, and they also go down the shaft.

15,418. Is the lode followed from the adit by the climbing way?—It is down from the surface.

15,419. Do the miners go down the shaft in cages?—Yes.

15,420. Are there any safety catches to the cage?—Yes.

15,421. Does it work well?—Yes.

15,422. Have any accidents ever occured?—Never in the shafts.

15,423. Has no accident occured from the use of the cage?—No; we have never had an accident in the shaft at all.

15,424. Is it a wet mine?—Middling.

15,425. Do you pump by steam?—Yes.

15,426. Do the men change their clothes when they go down below?—Sometimes; not very often until they come home.

15,427. Is there any place upon the mine where they can change their clothes?—When they do

HEXHAM.
7 Oct. 1862.
Mr. G. Henderson.

change their clothes they change them in the engine-house.

15,428. In the boiler-house?—Yes; they hang their clothes by the side of the boiler to dry.

15,429. What is the deepest level at which you are now working?—About 55 fathoms. The mine has been wrought deeper in my time as a lead mine only, and sometime previously, the mine was extensively wrought as a lead mine. Now it is principally wrought as a carbonate of barites mine and lead mine also.

15,430. What is the produce of your mine?—Carbonate of barites and lead ore.

15,431. Is there good demand for it?—Yes.

15,432. Are there any other mines of a similar description in the neighbourhood?—Not that yield any quantity of carbonate of barites; it is a common mineral, but it is not found in large quantities, at least not in the north of England.

15,433. What is the height of the levels?—Generally six feet under the timber, when it is necessary to put timber, and four feet wide.

15,434. In driving do you meet with any ends where the air is bad?—Yes; sometimes.

15,435. What do you do when that is the case?—We generally contrive to make a current of air play on the place, either by artificial means or by natural means, just which is most convenient; we always find that it is most advantageous to make the air good for the workmen.

15,436. What are the artificial means that you resort to in that case?—The fan blast generally, when we have to do it.

15,437. Is it worked by an engine?—It is worked both ways; sometimes it is worked by hand when only for a temporary purpose.

15,438. What pipes do you use?—We generally use wooden boxes; we have some metal pipes, but generally we use wooden boxes.

15,439. Have any accidents occurred in the mine from blasting?—No, we never had any.

15,440. Do you use the safety fuze?—Not extensively, only in sinking when there is wet work: we find it very beneficial in any place where much water comes out; but in a general way we do not use it.

15,441. Is there any reason why it should not be generally used?—I think that the other is more effectual, except in these cases, and then it is very useful.

15,442. Is a straw or paper match in use?—Paper.

15,443. Is there any club in your mine?—Not connected with the mine; there is one in the village.

15,444. Is there any deduction made for the club?—Not any.

15,445. What do the men pay for candles?—Just what they cost; we find them with the candles and they are charged the same as they cost.

15,446. Is there a fixed allowance per week to the men?—No; they take what they find necessary to use; some men who are working not on contracts are allowed a certain quantity per week, in addition to their wages; but in the case of the men who have contracts, they take what quantity they choose, and we deduct the amount from their accounts.

15,447. And is the practice the same with regard to the powder?—Just the same with the powder.

15,448. Are the tools weighed?—Yes; they are weighed.

The witness withdrew.

Adjourned to To-morrow at Allendale Town.

ALLENDALE TOWN.

Wednesday, 8th October 1862.

PRESENT:

The Right Honourable Lord KINNAIRD, K.T.
NICHOLAS RENDALL, Esq., M.P.
H. AUSTIN BRUCE, Esq., M.P.
RICHARD DAVEY, Esq., M.P.
P. H. HOLLAND, Esq.

The Right Honourable Lord KINNAIRD, K.T. in the Chair.

Mr. JOHN RIDLEY examined.

ALLENDALE TOWN.
Mr. J. Ridley.
8 Oct. 1862.

15,449. (*Chairman*). Which of the Allenheads mines do you manage?—Coalclough.

15,450. Is that West Allenheads?—Yes.

15,451. Does that join the Nenthead mines?—Yes, it communicates with the Nenthead mines.

15,452. Are there any others in the western district of the Allenheads mines besides that?—It communicates with Swinhope on the east side and with Nenthead on the west.

15,453. There is no other mine?—No other mine.

15,454. How many men have you employed underground?—278 underground.

15,455. Have you any smelting works there?—No.

15,456. Are there any boys among that number?—Yes.

15,457. What is the youngest age at which they go underground?—We have some boys who blow the machine occasionally, and they go in when they are about 12 or 14. Then amongst these we have 14 under 16 years of age.

15,458. Do the men work double or single handed there?—Double.

15,459. How do they go underground; by the adit level?—Yes, they have what they call waggonettes, and they ride along on those and take their working tools with them.

15,460. (*Mr. Austin Bruce.*) How far do they go generally?—From a mile to two miles.

15,461. (*Chairman.*) Are there shafts communicating with that horse level?—Yes.

15,462. About how many?—That is rather a difficult question to answer. I have a short report here, which is something like a general outline (*producing the same.*) There are so many shafts that it is difficult to count them; it cannot be done; and there are communications between the different levels, what we call rises and sumpts.

15,463. You cannot say how many direct shafts there are from the surface?—No.

15,464. But there are several shafts?—Yes. There are not so many shafts from the surface as there are below it communicating with the different levels.

15,465. What is the greatest depth below the level at which the men enter?—The works are all above this level where the men generally enter.

15,466. How do the men go to the higher levels?—By means of what they call rises and sumpts; by ladders.

15,467. Are they all ladders?—They are ladders about half a yard in width, with steps nailed to the sides, and they climb by those.

15,468. They are not regular ladders?—Yes, and in

a general way they are rather upon an incline because the veins incline.

15,469. Are there two or three feet between each two bars which they climb ?—No; they are only about 10 inches.

15,470. Do they climb at all by stemples ?—Yes; sometimes when the rise is not quite finished; but when there is a regular way gate, ladders are put in.

15,471. Are the bargains let quarterly ?—Quarterly.

15,472. Is so much kept in hand on the pay day ?—Yes; the subsistence is 40*s.* per month, and the balance is paid over to them once in a half year.

15,473. But the bargains are quarterly ?—The bargains are quarterly.

15,474. (*Mr. Austin Bruce.*) Do they get any other advance except the subsistence of 40*s.* a month ?—No; some parties sometimes apply for a little more in case they stand in need, and in those cases it is never refused when a man is in needy circumstances; but very few of the men ever ask for such a thing.

15,475. (*Chairman.*) Then all men get it equally ?—Yes; 40*s* per month.

15,476. What happens if, at the end of the half year, they have not earned that amount ?—They go into arrear.

15,477. Is that deducted off the following half year ?—Mr. Beaumont arranges it in this way: supposing that 5*l.* is in arrear, 50*s.* is struck off, and 50*s.* goes on to be deducted in the next half year, in case the man has earned it.

15,478. Whatever the arrear is Mr. Beaumont strikes off one half ?—Yes; it is lost sight of altogether.

15,479. Does that occasionally happen ?—Very seldom; sometimes.

15,480. Do the men live near the mines ?—The greatest part of them. They have to go a short distance; they come down the country about two miles or so, and they get to their own homes at night.

15,481. Have you any shops or lodging houses ?—No; nothing of that sort is required; some of them get lodgings about the place.

15,482. Is it a wet mine ?—It is a very dry mine; there is a little water occasionally.

15,483. The men do not change when they go into the mine ?—They never change.

15,484. Should you say that the men are generally healthy ?—I think they are.

15,485. Have you any men at all affected in their breathing that you know of ?—Some of them after they arrive at about 50 years of age or so are affected a little. There may be some affected a little earlier, but there are not many.

15,486. What does that arise from ?—I do not know much about things of that sort. It may arise chiefly from the dust, I should think, when they are beginning to drill the holes. It creates a dust, and they have to breathe in some of that in certain places.

15,487. Do not they use water to get rid of that dust ?—No; I think that that can scarcely be applied.

15,488. Do they not use water in boring the holes ?—Yes, sometimes when they have the advantage; if they drive a hole downwards, they occasionally put water in.

15,489. But, it is not universally used ?—No.

15,490. They are not supplied with water for the purpose ?—No.

15,491. Have you any accidents from blasting ?—Very seldom. There have not been above two or three in my recollection. I think there may have been some smaller ones, but very few accidents; the men are very careful in regard to gunpowder.

15,492. How do they take the gunpowder down, in tin ?—They have bags generally; our miners have bags. They sometimes take in a quarter barrel at a time when the mine is dry, and put it in a convenient place, others sometimes take the gunpowder to some of their own places and put it where it is safe, and carry it in woollen bags.

15,493. What do they bore with; have they all iron borers ?—No, they are steel borers.

15,494. What do they use as a tamping rod ?—They are generally made of iron, but there is a little steel on the end, they are what are called the hammers.

15,495. Do they use the safety fuze ?—No. They make squibs of paper.

15,496. And they use a pricker ?—Yes.

15,497. Is it an iron or a copper pricker ?—Generally copper now; they did use iron, but most of them have copper prickers now.

15,498. Do you supply the tools ?—They are supplied at the works, but they buy them.

15,499. Then the tools are not weighed for loss of weight ?—They buy them at first, they buy them sometimes by the dozen, and wear them down until they are a certain length, and then get two of them welded together.

15,500. Do you supply candles ?—No, they buy their candles as well, and gunpowder.

15,501. What do they pay a pound for the candles ?—Mr. Beaumont buys the candles, and they are charged just what he pays. They are charged to the miners at 6*s.* or 6*s.* 2*d.* a dozen.

15,502. And gunpowder the same ?—Yes.

15,503. Is there any club ?—Yes, there is benefit society.

15,504. Is that belonging to the mine ?—Mr. Beaumont contributes to it.

15,505. Is there any deduction made from the pay of the men for it ?—No.

15,506. Is there a doctor attached to the mine ?—Yes; Mr. Beaumont pays a part of his salary, and a part he gets by practice otherwise amongst us.

15,507. Is he obliged to attend any man ?—Yes, he is obliged to attend Mr. Beaumont's men.

15,508. For sickness ?—For sickness, and everything else in fact.

15,509. Do the men pay anything towards it ?—Yes, they pay 5*s.* a year for the head of the family, and if he has any sons working in the mines, they are charged 2*s.* 6*d.*

15,510. Does the doctor attend the family for that, or only the men ?—He attends the family, unless a son or daughter leaves the family and goes elsewhere and falls sick, and then I believe he can charge; but as long as they remain altogether as a family, what I have stated is the regulation.

15,511. Do the men ever make any objection to the doctor ?—No, we have had the doctor I dare say 20 years now, and he suits the people very well; they like him very well.

15,512. Do you use timbering or stone for the arching generally ?—Both, but chiefly timber.

15,513. Is there ever any accident from the falling of the ground ?—I do not recollect any.

15,514. In which level should you say there is the worst air ?—We have very few places of that description, they are all very near to where there is a circulation. We have one or two levels which are between 20 and 30 fathoms driven, where it is a little bad, and in those places we supply them with an air machine or some other blast, we sometimes get a water blast.

15,515. At which level should we find it if we went to see it ?—There is a level which we call the Captain's level, and there is one in Whitewood vein, where they are just beginning to rise; that is as close an end as any which we have, I think.

15,516. (*Mr. Austin Bruce.*) Where is the Captain's level ?—It is a little to the east of the West Boundary.

15,517. Is is near Coalclough ?—Yes; it is in Coalclough mine.

15,518. (*Chairman.*) How far in by the horse level is it ?—It is nearly two miles, but there is a communication all the way.

15,519. How many fathoms is this level above the horse level ?—It is just at what we call the

ALLENDALE TOWN.

Mr. J. Ridley.

8 Oct. 1862.

random, it is run in the same level as the horse level.

15,520. (*Mr. Austin Bruce.*) What is the meaning of the word "random" in this district?—It is running on at a certain level, and it has a reference to the stratum; whatever stratum it is in, it is at that random.

15,521. (*Chairman.*) Have you any ventilating machine now worked by water?—We have one, a pressure, water blast, and a few air machines, turned by hand.

15,522. Is the air carried in iron or wooden pipes?—In iron pipes generally.

15,523. Are they taken up into the rises?—Yes; wherever it is wanted.

15,524. When it is going up into the rises do you take any precaution against the stuff falling into it?—Yes, of course.

15,525. What precaution?—There is sometimes a brattice.

15,526. If you take the iron piping for the air up into a rise, what is to prevent the earth falling into it and stopping it up?—They put a wooden box at the end of the iron one, with a grate or piece of sieve to cover it, and there is a wooden box at the bottom, where there is a sluice to let the dust out.

15,527. (*Mr. Davey.*) You say that some of your men live in lodgings in the neighbourhood of the mines, are they much crowded?—No, they are not crowded; there are perhaps two or three lodgers in a certain family where they have convenience.

15,528. They have some home occupation, have they not?—Some of them work little farms as well as work at the mines.

15,529. What size do you generally carry your levels?—About six and a hal feet is the general height, and they are four feet in width.

15,530. What is the greatest distance which you have from any shaft or from any place where you can ventilate?—Between 20 and 30 fathoms.

15,531. How do you find the air in that place?—When they go beyond 20 fathoms we generally think they require an air machine, and that is when it is set to work.

15,532. And does that remedy the defect? Yes.

15,533. (*Mr. Austin Bruce.*) At what age do they usually begin to work as miners?—16 or 17. On this list there are 14 under 16 years of age out of 278.

15,534. What do you suppose is the age of the youngest among those?—15 years.

15,535. Are they doing men's work?—Not quite: some of these are along with their fathers; they sometimes take a son in before he is fit for what we call a bargain, and he works along with his father.

15,536. What employments have they up to the age of 15 or 16?—They are generally on the washing floor.

15,537. On the surface?—On the surface.

15,538. Up to what age do they generally continue to work underground?—Perhaps about 50, or from that to 60.

15,539. At what age do they generally give over working underground?—They generally work as long as they can, I think, because some of them are obliged to do so.

15,540. Have you many men in your works above 60 years of age?—There are 67 above 40.

15,541. Have you the number above 50?—No.

15,542. Are you a native of this district?—Yes, of West Allen.

15,543. You have lived in Allen all your life?—I have.

15,544. At the age of 50 is there any difference to be seen between the miner and the farm labourer?—There may be a little; there are old men amongst the miners as well as amongst the farmers.

15,545. Up to what age do they continue working in the mines?—There are some longer and some a shorter time.

15,546. What is the age of the oldest among them?—I should think that the oldest workman that we have may be about 64 or 65, as far as I can recollect. I do not know exactly his age.

15,547. You say that you have 67 men above 40?—Yes.

15,548. How many of those do you think have the asthma?—I really cannot answer that question.

15,549. It is not to be expected that you can give the exact number, but should you say one-third of them, or half of them?—I think that I would not go beyond one-third.

15,550. Do you mean to say therefore that two-thirds of the men leave off working as miners from old age, without having any particular disease affecting the breath?—I would not like to say that, they sometimes leave off and go to something else; some of them fall in for something else after they have wrought in the mines; they work as long as they are able to work at the usual work, though they are not quite as well as they were; they may be affected a little; we call them bad in the wind, that is what the miners call it.

15,551. In your opinion do two-thirds of the more elderly among the miners leave off without anything being the matter with their wind?—I scarcely understand what you want me to answer.

15,552. You say that one-third of those 67 above 40 have their wind affected?—Yes.

15,553. Then I ask you whether two-thirds of the men who leave off working from old age, leave off without anything being the matter with their wind, except such as would arise from the weakness of old age?—Perhaps many do not leave off unless they are affected a little in their wind.

15,554. Do the men ever make complaints to you of insufficient air?—Very seldom, because we soon know when they require more air.

15,555. When they do complain to you, what is your course?—We generally make the working men comfortable as soon as we possibly can.

15,556. Are their complaints always attended to?—I think they are.

15,557. Did you ever know them make unreasonable complaints?—It is very seldom that they make any complaints. If they make application that they want an air machine, or anything of that sort, then, if we consider it necessary, we set to work and get a machine in as soon as we can; that is the practice.

15,558. You have never had anything amounting to disputes with them upon those subjects?—Never.

15,559. Are they a quiet peaceable set of men on the whole?—Quite so.

15,560. They do not give much trouble?—Very little.

15,561. You say that you have had very few accidents indeed from blasting?—Very few.

15,562. Have you had any other accidents from other causes?—Twice or thrice amongst the boys driving the horses in the level, but it has generally been from carelessness, and not from the working.

15,563. Have any been injured from falling down ladders?—Never.

15,564. Are the men generally able to read and write?—Yes.

15,565. Do all the children go to school?—Yes.

15,566. By whom are the schools maintained?—By Mr. Beaumont.

15,567. Entirely at his own expense?—Yes; he built the schools and he is at the expense of supplying us with teachers, and he pays their salaries.

15,568. Do the men contribute nothing towards the schooling of their children?—All the children who attend pay 6*d.* per month.

15,569. One surgeon attends to all the workmen at Coalclough?—Yes, unless he has a bad case, or anything of that kind, and then he sometimes gets a surgeon from a neighbouring village.

15,570. What is the name of the chief surgeon?—Montgomery.

15,571. (*Mr. Kendall.*) Have you any pumps used at all?—No.

15,572. Not on your mine?—Not on our mine.

15,573. All you use is the common fan before you connect?—We have little air machines which are turned by boys, and there is a blast like a pressure of water.

15,574. The ventilation is generally very good, you say?—It is.

15,575. (*Mr. Holland.*) But there is a good deal of broken-windedness among the men nevertheless?—There is among some of them.

15,576. What do you think is the cause of it?—Something like dust, I think.

15,577. Is that the common opinion among the workmen?—I think it is.

15,578. Does the smoke injure them?—It may injure them a little, but I am under the impression that the dust does them more harm than the smoke.

15,579. Do you think that the candle smoke hurts them?—Perhaps it may a little.

15,580. Is that the opinion of the men, do you think?—I cannot recollect their ever expressing an opinion with regard to it.

15,581. Are they more liable to catch cold than other men?—I do not know; they may perhaps, to a certain extent, when they come out of the mine warm.

15,582. Are they often off work from illness?—They are very seldom off work.

15,583. (*Mr. Davey.*) How far have you driven the deepest level from the day?—About two miles.

15,584. That is principally arched by stone, is it not?—A good deal of this level is arched, but there is not any stone or wood in the greatest part of it at all.

15,585. In arching that ground do you carry an air-drift above it?—No.

The witness withdrew.

Mr. WILLIAM HEWITSON examined.

Mr. W. Hewitson.

15,586. (*Chairman.*) Are you surgeon to one of these mines?—I am surgeon to Mr. Beaumont's mines in East Allendale.

15,587. Have you been so long?—This is my 14th year.

15,588. Is the arrangement by a fixed amount paid by Mr. Beaumont, or do the men pay?—The payment is partly by the men, and Mr. Beaumont makes up the amount to the surgeon. The men only pay a very small amount; in fact it is only 5*s.* per man per year.

15,589. Have you other practice?—Private practice, but very little of that; it is nearly all mining practice.

15,590. During those 14 years have you seen much of what is called in other places miners' disease or shortness of breath?—I have seen a good deal of that.

15,591. How are the men affected?—At first it begins with a little shortness of breath—perhaps a little tickling cough; or a little huskiness in the throat.

15,592. Is it a sort of bronchitis?—It has scarcely arrived at that stage then; it does not go on to that until some little time.

15,593. When you have found that the case, have you ever seen it quite cured when it has begun in that way?—I do not think that I have ever seen it quite cured. Generally matters get worse, unless the men come out, and go to some out-door employment; then I have seen cases remain stationary for a long time, but if they continue to work they get worse as a rule.

15,594. At what age, generally speaking, should you say that they are more affected?—They begin to be affected soon after 40, in a general way; after 50, of course there are more affected.

15,595. Have you ever formed an opinion as to the cause of that?—The opinion which I formed was that it was owing to the dust in the mines settling upon the bronchial tubes, the windpipes, causing irritation and congestion there, and gradually, perhaps, leading on to inflammation and thickening of the bronchial tubes, that is thickening of the lining membrane of the tubes.

15,596. Does it ever arise from poor or bad air?—I am scarcely in a position to say that.

15,597. Do the men, when they come to complain of first feeling it, describe to you at all the place in which they have been working?—Yes, they frequently say that the air was bad.

15,598. What do you think that the men themselves attribute it to when they come to you?—I think that they attribute it to what I have just said, the collection of dust owing to the mines perhaps not being so well ventilated. Of course when the mines are well ventilated they do not feel so much of the dust. There is a current, and it is swept away.

15,599. Would the ventilation take away the dust of the stone or material in which they are working?—I think it would perhaps be more likely to be blown away.

15,600. Do you think that anything arises from candle smoke or powder smoke?—Yes, I think that that is also deleterious.

15,601. Have you ever observed the spit of the men?—Yes, but out of 100 men whom I examined on the 1st and 2nd of this month I found that scarcely one man would complain of any expectoration, although I am aware that nearly all the men do expectorate after working a few years in the mines.

15,602. (*Mr. Austin Bruce.*) How many of the 100 were affected with difficulty of breathing?—I have certain tables which I marked down at the time. Under 30 years of age I found only five per cent. affected with incipient asthma.

15,603. How many did you examine?—I examined 100. At that ratio I found only five per cent. affected with incipient asthma under 30 years of age. Of course those 100 were men of all ages. Between 30 and 40, 20 per cent. will be found to labour under pulmonary disease of some sort. Between 40 and 50 years of age, 30 per cent. have decided asthma; 50 per cent. have asthma in the incipient stage, and 20 per cent. are free from disease. That is a greater proportion of persons free from disease than I expected to find at that age. Between 50 and 60 years of age all are affected more or less; about 60 per cent. are affected, but not to a great degree; about 40 per cent. are cases of greater severity. Between 60 and 70 all are affected more or less in their breathing.

15,604. (*Chairman.*) How does this asthma affect their general health?—For a long time it does not seem to affect them at all. In fact there are many cases of incipient asthma which are not brought under my notice perhaps for years; they may not come under my care until some attack of bronchitis or severe catarrh, or something of that sort, brings them to me.

15,605. (*Mr. Austin Bruce.*) Is the attack of catarrh much aggravated by asthmatic disease?—I should think that the catarrh aggravates the disease then existing; it is more likely to lead on to inflammation.

15,606. (*Chairman.*) Have you ever examined the men's spit especially?—I have frequently.

15,607. Is it black dust or carbon in your opinion?—I have sometimes seen greyish material in it, but in a general way it looks simply like mucus; and I put that question to nearly all these men, whether they had any expectoration, and very few would admit that they had any expectoration at all, and as regards the few that did admit it, all their explanation was that it was only like phlegm, by which they mean mucus, I suppose.

15,608. When the men are off work from sickness,

ALLENDALE TOWN.

Mr. W. Hewitson.

8 Oct. 1862.

is there any club or provision for them ?—There is a most excellent club at Allenheads.

15,609. Is that independent of the mine ?—It is connected with the works, and Mr. Beaumont himself contributes largely to it.

15,610. It is an independent club ?—Yes ; I think it is principally confined to miners ; a few others have been admitted, but they are only to be admitted on leave from Mr. Sopwith, if they are not miners at the time. It is not exactly confined to miners, because some of Mr. Beaumont's men are out-door labourers —quarrymen.

15,611. Is it optional whether the men enter the club or not ?—Quite so.

15,612. (*Mr. Austin Bruce.*) Have you observed any improvement in the men's health since you have been placed here ?—I cannot say that I have.

15,613. Any change for the better or the worse ?—I do not see very much change in that respect, I have only the men's statement when they say that the mines are much better ventilated than they used to be.

15,614. Have you observed any difference in their health in consequence of that improvement in ventilation ?—I have not.

15,615. Have you ever attended men who professed to have suffered from working in any particular close end ?—No doubt I have done so, although I cannot call it to mind. No doubt some cases of that kind have come under my observation.

15,616. You do not recollect their complaining to you ?—No, I do not.

15,617. Should you say that the life of a man was shortened in consequence of his employment ?—I think so, decidedly.

15,618. To what extent as compared with the surrounding agricultural population ?—I have not been able to ascertain that, but I have looked over the certificates of the cause of death for the last 10 years, of miners who have died in this district that I have attended, and I find that there were 72 deaths in the last ten years, and the united ages of these men amounted to 3,204 years, giving 44½ years as the average age of each miner in my district.

15,619. Have you compared that with any number of agricultural labourers ?—No ; I have not had an opportunity of doing so.

15,620. Do you believe that to be below the average of a similar number of agricultural labourers ?—I think that it is below the average of agricultural labourers, but I believe that it is above the average age of miners generally ; I think that the average age of miners generally is rather below that.

15,621. Have you ever known any other mining population than in your district ?—No. I lived at Allendale Town as assistant to Mr. Arnison, three years before going up into that district.

15,622. That is a similar population ?—Yes, and it was of course at the very commencement of my practice.

15,623. Are they exposed to any other disease except this asthmatic one which you have mentioned ?—They are liable to many diseases.

15,624. I mean any special disease ?—Not in connexion with the mines.

15,625. (*Mr. Kendall.*) When you visit those miners, of course you are able to see how their bed rooms are, and to know as to whether they are crowded or not ; how is that ?—In some cases they are crowded.

15,626. How many have you ever known sleeping in one room ?—I cannot say.

15,627. But at times they are much too crowded ?—Sometimes they are much too crowded but that is the people's own fault ; it is perhaps in order to make up a little money that induces them to take lodgers. There are some ironstone works in an adjoining district, and some of the workmen, single young men, come over to Allenheads to get lodgings, to sleep for the night.

15,628. Do you think that much evil arises from that ?—It cannot be good at all ; overcrowded apartments must be objectionable.

15,629. You have never met with any case of illness which followed immediately upon it ?—Not which I could trace immediately to that cause.

15,630. (*Chairman.*) Those are mostly young men, are they not ?—Yes.

15,631. (*Mr. Austin Bruce.*) Have you any statistical reports besides those with which you have furnished the Commissioners ?—No.

15,632. (*Mr. Holland.*) Do a large proportion of the men live in overcrowded sleeping rooms ?—Not many, I think ; not a large proportion by any means. In fact the dwellings in our district are very comfortable ; indeed some of them are almost luxurious for miners.

15,633. Then the overcrowding of which you speak is an exception ?—It is.

15,634. And a rather rare exception ?—A comparatively rare exception.

15,635. Then of course it would not affect the condition of the men to anything like the amount shown by this table ?—Nothing like it.

15,636. You say that 72 men lived, on the average, 44½ years each ?—Yes.

15,637. What is the youngest age of those ?—It would require to go over the table again in order to answer that question.

15,638. Were there any working in the mines under 20 years of age ?—There were some 17 or 18; there are perhaps two or three cases in 100 where they may begin at 17 or 18, but they were mostly as old as 20. Out of 100 miners that I examined the other day at Allenheads there were only three under 20.

15,639. (*Mr. Austin Bruce.*) Were the 100 miners a fair sample of the mining population of the district ?—Yes ; they were just taken as they first came out of the mines ; the first 100 that came out.

15,640. (*Mr. Holland.*) You say that 20 per cent. of those between 30 and 40 were labouring under pulmonary disease of some sort ?—Yes.

15,641. That includes every variety of lung disease?—It is principally asthma, but it is more in degree.

15,642. Was there any true phthisis among those cases ?—Not that I examined ; I believe there was one threatening it.

15,643. Rather more than a third of the cases were decidedly asthma ?—Yes.

15,644. Were those chiefly young miners ?—At all ages.

15,645. Is phthisis pretty well distributed among all ages ?—Pretty well ; but of course it is a disease which affects the young chiefly.

15,646. Do you consider the miners' asthma, at its commencement, a perfectly distinct disease from phthisis ?—Quite distinct from phthisis.

15,647. You have no doubt about that at all ?—Not the slightest.

15,648. Have you heard the men attribute injury to their lungs to breathing close air, or only to dusty air ?—To close air and dusty air also.

15,649. Have you heard them attribute it to close air alone ?—I have heard them complain of both very much ; they were so mixed together that it was very difficult to distinguish.

15,650. Do you consider miners particularly liable to catch cold ?—I asked these 100 miners that I examined, "Are you liable to take catarrh, that is to "say, cold ?" Only about 10 of that 100 would say "Yes."

15,651. Then it would appear that they were less liable than men usually are ?—Yes. I asked whether they were any more liable than the generality of men, and they said, "No."

15,652. Does that correspond with your own observation ?—Yes, I think it does.

15,653. Does the asthma come on very gradually ?—Very gradually ; in fact, a man will labour under difficulty of breathing for 20 or 30 years, and the surgeon in the district, perhaps, will not know that he has such a disease.

15,654. How does it show itself at first ; simply

from difficulty of breathing?—Simply a little shortness of breath, and a little cough and huskiness.

15,655. I am told it is some time before large expectoration begins?—Yes, it is many years, perhaps, before that will take place; if a person is predisposed to chest affection, of course it makes a difference.

15,656. Is it generally a good many years before they become decidedly ill?—Yes.

15,657. Have you known men become rapidly ill from working several months in very bad close air?—That has not come under my notice.

16,658. I suppose I am right in assuming that you say that in almost all cases the disease is of very slow progress at its commencement?—Very slow progress at its commencement; unless a person has any lung disease, perhaps, or a weak constitution.

15,659. Such as tubercular deposit?—Yes, it is then apt to hasten on.

15,660. When the men are much affected in their lungs and get out-door employment, does the disease become suspended?—I have known cases where it has been suspended for a time.

15,661. For a long time?—For a long time. Their health improves very much as far as appearance goes. Instead of being pale and pasty-looking, as the miner generally is, they are ruddy.

15,662. If they get out-door employment they may live for many years asthmatic?—Yes.

15,663. Are they frequently able to get surface work?—Some who can afford it when they have grown-up sons will leave their employment and do little or nothing; they will, perhaps, just work about their ground at home, and they live on for many years.

15,664. Without getting rapidly worse?—Yes; I know one man of 77.

15,665. (*Mr. Austin Bruce.*) Is the population of this district a migratory one?—It has been rather migratory lately.

15,666. Have you any men here from Alston Moor?—No.

15,667. Do any of your men go there?—Not that I am aware of.

15,668. Have you no men working here who have been working in other mines out of this immediate district?—Yes, there are some working in the mine in Derwent.

15,669. Some have been working in Derwent?—Yes; in fact some who are living in my district work in Derwent now.

15,670. But you have no men working here who were working in other districts before they came here?—I cannot say that.

The witness withdrew.

WILLIAM CAMPBELL ARNISON, Esq., Surgeon, examined.

15,671. (*Chairman.*) Are you a medical man?—Yes, residing in the village here.

15,672. Have you charge of any portion of the mining district?—No particular district, in fact, I have not been much amongst the miners for upwards of 20 years.

15,673. Have you at all observed cases of miners' disease?—Not particularly of late years, my practice has been more of a general nature.

15,674. Is there any disease to which the agriculturists or others about here are subject?—No, I do not think that there is anything more than common.

15,675. Are they subject to any asthma or difficulty of breathing?—No, we have not had many cases of asthma.

15,676. Consumption?—We have a good many cases of consumption, but still I do not think that we have more than there are in country places generally.

15,677. Have those cases of consumption which have come under your notice been of agriculturalists or of miners?—Both.

15,678. (*Mr. Holland.*) In your opinion is miners' asthma a distinct disease from phthisis at the beginning?—I think it is; but I have not had many cases of it of late years, and in fact we never have an opportunity of making a post mortem examination, but I do not think that asthma is a prevalent complaint here at all.

15,679. Are you speaking of miners or amongst the general population?—Amongst the general population.

15,680. And among miners you have not had much practice lately?—I have not had much practice for the last 20 years amongst miners.

15,681. Do you consider this a healthy part of the country?—I consider it a very healthy district.

15,682. Amongst the general population?—Amongst the general population.

15,683. And that there is no excessive prevalence of lung disease among the general population?—I do not think that there is.

15,684. (*Mr. Kendall.*) Though you have not practised among the mining population, yet you are in the habit of seeing them; do you think that as a body they are improved in health from what they were 20 years ago?—Yes, very materially, I consider.

15,685. To what do you attribute that?—I attribute it in the first place to the mines being in a much better state than they were 20 or 30 years ago.

15,686. A much better state of ventilation?—Yes, and there is another thing, namely, that the miners' dwellings are much more comfortable.

15,687. There is much more interest taken in the miners' health and welfare than there used to be some 20 years ago?—That is decidedly the case; in fact I think that everything is done for the miners that can be done in this district, from what I have seen of them.

15,688. So far as they go, are they more careful themselves than they were 20 years ago?—I think so, decidedly.

15,689. They are better educated?—They are better educated, and I think that there is more temperance amongst them.

15,690. Then as a class of people they are very much improved?—As a class of people they are improved.

15,691. Both in health and in manners?—Yes.

15,692. You speak of this immediate district?—I am speaking of this immediate district.

15,693. You have not the means of speaking of any other district at all?—No.

15,694. You generally stay in this district?—Yes; I generally attend in this parish, and in Whitfield, the adjoining parish.

15,695. Do you think that in the improved state of the mining population there is a very great difference between the health of the mining population and of the agricultural population?—Yes; I should say that the agricultural part of the population are decidedly healthier.

15,696. There is still a difference?—Yes; there is no question of it.

15,697. But there is not so great a difference as there was 20 years ago?—I think there is not.

15,698. Perhaps the agricultural population have increased in their comforts?—Yes; there is no question of it.

15,699. But the miners have made a more rapid stride than the agriculturists in the last 20 years?—Yes; I should say so.

15,700. (*Chairman.*) How long have there been schools here?—We have had a free school here ever since I can remember, and long before.

15,701. So that there are men working in the mines now who have been educated in those schools?—Yes; in fact, I should say that the most of Mr. Beaumont's agents have been educated in the district.

The witness withdrew.

Mr. William Montgomery examined.

Allendale Town

Mr. W. Montgomery.

8 Oct. 1862.

15,702. (*Chairman.*) Are you the medical practitioner at West Allendale ?—Yes.

15,703. How many years have you been in the district ?—I have been among the miners for 25 years.

15,704. Have you charge of the West Allendale mines, under Mr. Beaumont ?—Yes, I have ; but I am on the other side of the water, nearer to Nenthead.

15,705. During the time you have been here, have several cases of miners come under your notice who were suffering in their breathing ?—Yes.

15,706. At what age have you observed that that complaint generally commences ?—It takes a decided form between the age of 38 and 45 or 50, and sometimes sooner ; it depends upon when they go into the mines. If they go into the mines before they come to the age of puberty, the complaint attacks those miners sooner. There is a number of young boys, at the age of 14 or 15, taken in with their parents into the mines before they are able to work full work.

15,707. And in your opinion, those young persons are sooner affected afterwards than others who begin to work in the mines at a later period ?—Decidedly.

15,708. Do the men discover any early symptoms of this disease before they come to you for advice ?—They do not apply to me when the cough and the asthmatic symptoms begin, they do not apply for some time—three, or four, or five years.

15,709. So that the early stages of the disease are not always, or seldom brought to your notice ?—No ; the men do not come under medical treatment.

15,710. Do you think that the disease could be checked if it were treated at an earlier stage ?—I think so.

15,711. Have you ever known a case of the disease being checked when it was brought under treatment at an early stage ?—Yes, several cases.

15,712. Have the men gone back to their work ?—Yes.

15,713. And have they had no return of the disease afterwards ?—It always does return upon them sooner or later.

15,714. How are the men affected ; what are the symptoms ?—It begins with cough and difficulty of breathing, and derangement of the digestive organs, mucous expectoration and liquid phlegm, that is the commencement of it.

15,715. When the men come to you for advice what do they attribute their complaint to ?—They attribute it to the mines.

15,716. Do they ascribe it to anything particular in the mines ?—To the impure gases which they inhale in the mines, and the powder reek, and the dust and small particles of the rocks and of the different strata they are blasting, which they must inhale more or less.

15,717. Is it your opinion that they are right in attributing it to those three causes ?—I believe they are right.

15,718. Have you ever known cases of miners who have left the mines, and who have got quite rid of the disease ?—I have known of some leaving between the ages of 30 and 40, before they became decidedly affected, and never being troubled with it at all, and living to a good old age. Many are living over on the west side of the water now who left the mines, and who are now doing very well.

15,719. Have you ever had an opportunity of attending any of the miners on the west side besides those under Mr. Beaumont ?—There are no other mines there on the west side. I am sometimes over in Nenthead.

15,720. Do you perceive any difference in the miners in Nenthead or the Alston district as compared with the men who are working here ?—I think that the men are not so healthy as the men employed in the West Allen mines ; their appearance is not so good ; those that I have seen in the way of my medical experience, I think that they are decidedly worse than the West Allendale miners.

15,721. What opportunity have you had of comparing the health of the miners in the two districts ?—Very little, but I have been called in in consultation with my medical brethren, and all the knowledge that I have has come in that way, not very often either ; but their general appearance is more unhealthy than in the West or East Allen side.

15,722. To what do you attribute that difference ?—I cannot tell. It may be the imperfect state of the ventilation in the Alston Moor mines. I do not know that they are any worse ventilated than ours, but it looks like it.

15,723. Have you ever made any calculation as to what proportion of the men are affected out of every 100 ?—I have made no calculation.

15,724. (*Mr. Austin Bruce.*) How many men do you think would leave work at 50 years of age unaffected by the miners' disease ?—I should say none at all, or very few at the age of 50.

15,725. At the age of 40 how many men leaving off work do you think would be likely to be entirely free from asthma ?—It generally begins between 38 and 45 or 50.

15,726. Then a certain proportion at the age of 40 would be unaffected ?—Yes, there is a certain proportion, but I cannot reduce it to figures.

15,727. What would your impression be ; would half of the men at 40 be unaffected by the disease ?—I think that half would not be unaffected.

15,728. (*Chairman.*) Have you ever had an opportunity of making post mortem examinations ?—Never ; they are never allowed in our country.

15,729. Have you ever examined the expectoration of the miners ?—Yes.

15,730. Have you ever observed anything peculiar in it ?—Yes, where the disease has become decidedly fixed the expectoration is similar to the expectoration of tubercular consumption, muco purulent, purulent, and sometimes approaching to the expectoration of coal miners' consumption, inclining to a dark blue, nearly black sometimes.

15,731. Have you ever observed that to continue after a man has left off working at the mines ?—Yes,

15,732. For a long time ?—Yes, they often die with it ; those who spit up this dark coloured expectoration very often die with it. Some young men I have observed with this black spit that have got completely rid of it, and they are now working in the mines again. In the case of some young men who have gone in too soon to work——

15,733. (*Mr. Austin Bruce.*) To what do you attribute the dark colour of the expectoration ?—I should say it was produced in this manner : from the carbon that they breathe from the candle smoke, and the powder smoke, and the strata in which they work.

15,734. I understand you to say that even after they had ceased to work in the mines the expectoration would continue, and the colour would still be dark ?—Yes.

15,735. In that case it could not be caused by the substances which they inhale ?—Not then, but in past life.

15,736. Do you think that their lungs would be so loaded that the expectoration would be of the same dark colour afterwards ?—Yes, I have seen calcareous expectoration for a long while after.

15,737. For how long have you observed that ?—I have seen it for a very long time when they have been lying on their death bed ; many times I have seen it in the expectoration ; but referring to a case that I have in my memory just now, the man did not cease to work for a long time, or rather, he did no long live after he did cease to work.

15,738. In your opinion does this disease affect, to any considerable extent, the length of the miner's life ?—Yes, I should say that it does, decidedly.

15,739. Have you formed any opinion as to the extent to which life is affected by it ?—I can tell you

what I think is about the average duration of miners' lives in my district. I should say that it was about 45 or 46.

15,740. What do you think would be the average duration of the lives of agricultural labourers?—Very near 60, I should say, but I am not prepared to say positively.

15,741. You have stated that, in your opinion, this disease is caused partly by the powder reek that they inhale, and partly by the dust which follows the explosions, and partly also by gases which they inhale?—Yes.

15,742. What are the gases that are thrown out in the lead mines?—I cannot tell, but there is carbonic acid gas very often. I have heard of men being pulled out of the levels almost dead, labouring under the apparent influence of the poison of carbonic acid gas.

15,743. Have you ever known an explosion to take place in the mines?—Yes; in the course of the last 25 years, I have known of carburetted hydrogen being set fire to, but not causing any serious mischief, and there was one young man about 12 or 14 or 15 years ago who exploded in the same kind of rocks some carburetted hydrogen which burned his whiskers and his hair; it singed him a great deal.

15,744. Have you known frequent cases of men who have suffered from inhaling carbonic acid gas?—Not so much lately, the mines are better ventilated.

15,745. Is that, in your opinion, in consequence of a larger supply of fresh air being introduced into the mines?—Yes.

15,746. I suppose that a large supply of fresh air, while it would carry away the powder smoke, would rather increase the danger from the dust?—The miners generally, after they blast a hole, sit down and rest a bit out of the influence of the explosion until it all settles; but there is not a current or draft throughout the mines to cause the dust to fly about, not to raise it.

15,747. Have you ever known any cases of cholera?—No.

15,748. Have you ever practised in any other mining district than this?—Never.

15,749. With the exception of the asthmatical tendency, are the miners as a class in all other respects free from disease?—The other diseases to which they are liable from their mining are pulmonary diseases, affecting the substance of the lungs or their investing membrane, the pleura.

15,750. And rheumatism?—Not so much.

15,751. Do you think that the men suffer from being long in the works, and then being exposed to a different temperature when they go home?—I think that that may induce some slight coughs or catarrhs.

15,752. You do not distinctly trace rheumatism to that cause?—No; there is some rheumatism, but very little, comparatively speaking.

15,753. (*Mr. Holland.*) You have stated that the miners are very liable to pulmonary disease?—Yes.

15,754. Are the women very liable to it?—Not so much.

15,755. Any more so than other women?—No.

15,756. Are the inhabitants of the district generally not peculiarly subject to pulmonary disease?—No.

15,757. Not more so than among persons having nothing to do with mines?—No.

15,758. You have also stated that you thought the Alston Moor miners looked worse than the Allendale miners?—Yes.

15,759. Do you mean generally?—Yes, I do; I speak of what I have seen of the Alston and Nenthead miners, judging from their common appearance.

15,760. Do the Alston Moor miners come here to work frequently?—Yes.

15,761. You have stated that, in your opinion, cases of asthma might be cured if treated early; did you mean that the miners might be cured if they left their employment earlier?—Yes.

15,762. And they would not be cured by any remedial means if their employment continued?—No.

15,763. As long as the cause continued the effect would continue?—Of course.

15,764. You said also that the disease might go on for years, not only slight cough, but difficulty of breathing, and attract very little notice?—Yes.

15,765. Is it quite distinct at that time from common phthisis?—Yes.

15,766. And it is only confounded with phthisis when it is very far advanced?—Yes.

15,767. Do not the miners leave their work when they become so affected?—Not always; very seldom indeed.

15,768. They may leave for other reasons?—Yes.

15,769. For whatever reason they may leave their work, they are generally affected by the disease if they are above the age of 40?—Yes; they are slightly affected then.

15,770. If you were told that a lead miner on the average lived six or eight years less than other men, should you think that remarkable?—I should expect that they would live less than some other trades, but I should hardly think it would be so much as that.

15,771. Have you no means of ascertaining how much less?—Not now.

15,772. Does a miner at the age of 40 look as old as an agricultural labourer at 50?—He looks older.

15,773. At 50 does he look older than an agricultural labourer at 60?—Yes; decidedly older than the average run of agricultural labourers.

15,774. If that be true you will not be surprised to be told that they die upon the average eight years younger?—There is a difference there, I think.

15,775. To what do you attribute the difference in their appearance besides their ill health?—I attribute it to the progress of the disease that is going on within them.

15,776. Do you attribute the chief part of the older look in the miners to internal disease?—Not more to the progress of disease than to their exclusion from open air and sunlight.

15,777. You would not expect them to die so much earlier as their looks would indicate?—No.

15,778. Still you are satisfied that a miner would die earlier?—Yes; but they are very much improved of late years.

15,779. You cannot say how much earlier you think a miner would die?—Four or five years on the average.

15,780. (*Mr. Austin Bruce.*) Are the miners a tolerably sober set of men?—Very much so for the most part.

15,781. (*Mr. Holland.*) Do they lodge pretty well? The greater part of the miners have good houses, others are not so well lodged.

15,782. Is there not some overcrowding amongst them?—Yes.

15,783. Does that affect a large proportion of them, or only a small proportion?—A small proportion.

15,784. That cannot then have a very strong effect upon the health of the class generally?—No.

15,785. Do they live pretty well?—Yes.

15,786. Do they suffer at all from dyspepsia?—Yes, they do.

15,787. Do they suffer much from it?—A good deal.

15,788. To what do you attribute that?—I think it is owing to their working in the mines.

15,789. Do you mean working in air that is not quite fresh?—Yes; it takes away their appetite considerably.

15,790. Is not that a proof that the air is not sufficient for their health?—The air is not sufficient for their health.

15,791. Speaking of the air alone, and quite independently of the dust?—Yes, that is, the gases; it is not sufficient for their health, but they have been very much improved in the last 10 or 15 years.

ALLENDALE TOWN.

Mr. W. Montgomery.

8 Oct. 1862.

15,792. Has their health, with reference to the prevalence of dyspepsia, become much improved in the last 10 or 15 years ?—Yes, decidedly. I calculate that a miner 15 years ago at the age of 30 was only equal to a miner at the present time of the age of 40.

15,793. In appearance and in health ?—Yes.

15,794. Is the chance of his life at 40 equal to what it used to be at 30 ?—Yes.

15,795. Has this improvement taken place lately, or has it been going on gradually ?—It has been going on gradually.

15,796. To what do you attribute that ?—I attribute it to the better state of ventilation in the mines, and to their stopping shorter hours in the mines. They used to work for 12 and 14 hours at a time, and now they work for only eight hours.

15,797. Is the quantity of dust that they breathe diminished ?—Their number of hours formerly were 48, now they work 40 hours per week they must be exposed to the influence of the dust ; 8 hours, therefore, the quantity of dust that they breathe is diminished.

15,798. Is their health with reference to lung disease as much improved as it is from being less liable to dyspepsia ?—Yes, there are very few cases now; almost all the miners go down with this miners' asthma, which terminates in a complaint resembling tubercular phthisis ; but the occurrence of pneumonia, pleurisy, and pleuropneumonia is now almost nil to what it was 15 or 16 years ago.

15,799. Do you mean that acute diseases of the lungs are less frequent than they were 15 or 16 years ago ?—Yes.

15,800. Do the cases which require bleeding occur much less frequently than they did 15 or 16 years ago ?—Yes.

15,801. But it is very rare to bleed a man now, is it not ?—Yes, very rare indeed, not once in a year.

15,802. Are you sure that that is attributable to a change in the disease, or to a change in medical opinions, or to which most ?—It is a change in the disease I should say partly, and it may be an improvement in the treatment otherwise.

15,803. (*Mr. Austin Bruce.*) Do the men drink any beer with their daily food ?—No, very few of them.

15,804. What beer is drank by them I suppose is drank at the end of the week ?—Yes.

15,805. Do none of the working people drink beer with their meals ?—Very few, they are almost all in teetotal societies in my district.

The witness withdrew.

Mr. WILLIAM CURRY examined.

Mr. W. Curry.

15,806. (*Chairman.*) I believe you have charge of the East Allendale mines ?—Yes.

15,807. How long have you been so employed ?—I have been in that position for 27 years.

15,808. What is the number of men employed in the East Allendale mines at present working underground ?—There are 301 men so employed.

15,809. How do the men enter the mines ?—Part of them go in by an incline, and the other part down the shafts. They are drawn up in cages.

15,810. How are they enabled to ascend and descend the shafts ?—By machinery, the principal part of them.

15,811. How do they go down ?—The shafts are partitioned, and they go down in tubs or cages.

15,812. Is it the patent safety cage that is used ?—It is not.

15,813. Do you ever have any accidents in these mines ?—Not with the exception of one or two, when coming up the shaft. At the top the framing is closer than below, and by carelessness had their heels outside the cage and were bruised.

15,814. Is the machinery worked by hydraulic power ?—Yes.

15,815. What is the lowest level to which the men descend ?—The deepest shaft that we have is 93 fathoms ; but when I say that a level goes into the side of a hill, and the depth taken from it. There may be, perhaps, 50 fathoms above that to the surface.

15,816. Have any accidents occurred from blasting ?—We have had accidents occasionally, but very seldom.

15,817. Do the men use the patent fuze ?—Never, except in wet places in sinking.

15,818. Is there any reason why it should not be generally used ?—No ; I do not see any particular reason why it should not be generally used beyond the extra cost incurred.

15,819. Do the men prefer the other mode ?—Yes, they do.

15,820. Do they use copper or iron prickers ?—Some are copper, and some are iron ; the principal part are iron. In the hard mines, where they are more subject to explosion, they are copper, and in the softer mines they are iron.

15,821. Do you mean by softer that they are not liable to explosion from the pricker coming in contact with the rock ?—I mean they are not so liable as the others.

15,822. In the case of the accidents that have happened, have you been able to trace the cause of them ?—In some of them we have ; nearly all, in fact. I have known an accident occur where a hole has been charged, a squib has been put in, and has burned down half way, and then exploded, just when the men were going back to take it out ; in other cases, from cracks in the rock, where the gunpowder has got in, and in beating to fill the hole up, it has exploded in those cracks.

15,823. I suppose the tamping rod has come in contact with the rock, a spark has been struck, and the powder exploded in the crack ?—Yes.

15,824. If the tamping rod had been made of a material that would not have struck fire against the rock, the accident would not have happened ?—No ; it would not have happened.

15,825. Is the mine at all wet ?—It is dry, comparatively speaking ; very dry.

15,826. Do you think that the men suffer at all from the dust ?—I think they do occasionally in some places.

15,827. Are they supplied with water when they are boring, or how do they get it ?—It is very little used.

15,828. Do they bore dry ?—Yes, they do generally; in some few cases they do not, but by far the greatest bulk of it is bored dry.

15,829. Does not water facilitate the boring ?—In tough stone I consider that it does, but not much in a very hard one.

15,830. What is the stone in which the mineral is found ; what kind of rock is it ?—We have stratified rock in our mines composed of shales, hazels, and lime, all of which produce less or more ore in places, but the great or mountain limestone is the principal bearing sill.

15,831. Is the gunpowder smoke long in clearing away in any of the ends in which the miners are working ?—No, it is not, with the exception of one single place in the whole of the mines.

15,832. Where is that ?—That place is in the southern part of Victoria vein.

15,833. What are you doing there ; is it a rise that you are putting in ?—No, they are merely working the drifts; there is a regular communication through, but the draft is not strong enough to take away the smoke quickly.

15,834. Have you employed any artificial means ?—Yes, all the artificial means that we could use, such as placing trapdoors, and confining the current to one course; in other cases we have succeeded, in this

case it is not so good; but there are only four men working in that place.

15,835. Do you use a fire blast down below?—None below, but there is one at the surface.

15,836. Have you any shaft by which to draw out the foul air?—Yes, there is one below the furnace I spoke of for that purpose.

15,837. Where is that?—That is a little south of Allenheads, and communicates with the principal workings in Henry's vein, by the Plantation cross cut, which is 600 fathoms in length.

15,838. Have you no means on the mine for drawing out the air by exhaustion?—We have one on the Blackett level works.

15,839. Does that answer?—I can scarcely give a decided answer upon that.

15,840. Has it been long used?—It has been in practice here for about 16 months.

15,841. What do you think is the best mode of ventilating a place where the air is bad?—In sucking the air out there is this advantage, that it keeps the level all clear alike from one end to the other, I consider when the pure air is blown in to a fore end the men have better air to work in; but the great danger then is of the foul air accumulating behind, and clogging up, so that they could not get out; I have known instances of that kind where the men have had to come through some portion of the drift where they could not carry a lighted candle; and drawing the air out avoids that.

15,842. Have you known it to happen that after the men have been working and have been supplied with pure air they had to pass through bad air where the candle would not burn?—Yes, I have seen that.

15,843. I suppose that there is nothing of that sort now that one could see?—No. I do not know that it has occurred more than twice or thrice, and always in the same place, the plantation cross cut.

15,844. That, I believe, is where you have now a furnace?—Yes.

15,845. Has the furnace remedied that state of things?—Yes; it has effected a decided improvement.

15,846. Do you at all know what quantity of coals are consumed in that furnace?—I cannot answer that question off hand.

15,847. (*Mr. Davey.*) Can you assign any reason why the air should be stopped all at once after blowing fresh air in so as to prevent the men from going back again?—I cannot, except from the quantity forced in not being in proportion to the requirements of the men, and at the same time to force the smoke out of a drift 600 fathoms in length, as in this case.

15,848. Was there sufficient air for the men to work in at the end?—They could work, but not comfortably; there was certainly not sufficient.

15,849. Had there been sufficient air forced in would not that have been enough to extract all the impure air?—Yes, certainly.

15,850. Are there any cracks in the limestone?—Yes.

15,851. Do you think that there is any escape of carbonic acid gas from those cracks?—Yes; large quantities at times.

15,852. So much so as to extinguish a candle?—Yes.

15,853. Have you ever known an instance in which the men have been affected by it?—No; I am not aware of that, I have tried it repeatedly with a candle.

15,854. That would of course affect the whole of a working?—Yes; in that part of the district, so far as those men were concerned; not the whole district, but in that partnership.

15,855. (*Mr. Kendall.*) Were you a working miner yourself originally?—I was.

15,856. How early did you begin to work as a miner?—I cannot answer that question exactly.

15,857. About what age were you when you began?—I think about 11 or 12, perhaps 12.

15,858. Did you work on the surface or underground?—I worked underground.

15,859. In this neghbourhood?—Yes; in Mr. Beamont's mines.

15,860. What was your occupation at the age of 12?—To blow an air machine.

15,861. How long were you occupied in that employment?—I think for not more than 12 months.

15,862. What did you do afterwards, did you still work underground?—Yes; I was a hireling after that with some men at bargain work.

15,863. What was the nature of your work?—Drilling holes; I was a regular miner so far as I was capable, and after this I was employed in bargain work.

15,864. And you worked your way up to become an agent?—Yes.

15,865. How long did you work as a miner before you became an agent?—About 10 years.

15,866. How long have you been an agent?—27 years, come the 24th of next December.

15,867. While you were working underground were you ever in the doctor's hands?—I think I was.

15,868. Do you recollect what it was for?—It was some liver complaint I think.

15,869. Since you have been a miner, and since you have been an agent, has there been any great improvement in the ventilation of the mines?—Yes; a decided improvement.

15,870. Has the health of the men become very much improved since that?—I think the health of the men has improved.

15,871. Are the working hours now as many as they were when you first commenced?—Yes.

15,872. Eight-hour cores?—Yes; but they are more punctually worked now than they were formerly.

15,873. You are of opinion that the ventilation has been very much improved, and that the men work more comfortably; but that the hours of working are the same now as they were before?—Yes.

15,874. What should you imagine, in consequence of the improved ventilation and other improvements which have been made, is the increased value of the labour performed in the eight hours; or, in other words, can a man do as much work under the improved system in six hours as he could in the olden time in eight hours?—He ought to do it in some of the fore-ends, if he was willing.

15,875. He has the ability to do it, if he likes, with the same wear and tear of constitution?—Not, generally speaking; only where the places were so very bad for air.

15,876. What do you think that a man, with the same wear and tear of constitution, can do now during eight hours, compared with 25 years ago; do you think he can do 20 per cent. more work, or one-fifth more?—He could not do that, generally speaking.

15,877. Do you think he could do 10 per cent. more?—That is a subject I have never fairly thought about; but I think 10 per cent. could be accomplished if confined to the fore ends, for these are places where the greatest improvement in the ventilation has been made, but not throughout the whole mine.

15,878. Where there is good air, have you any doubt that a very large per-centage more of work can be done?—Yes; I have known places where, previous to communications being made, the men were allowed to go in and work as long as they could and come out when they liked; sometimes they worked three hours, four hours, or six hours; but the air varies in the same place; it will vary considerably on different days and in different weeks.

15,879. It would vary with the state of the atmosphere?—Yes.

15,880. At present there are no cases of that kind, I suppose; the ventilation is generally good?—Yes; it is generally good.

15,881. Either by the use of a fire machine or a pumping machine, your ventilation is good?—Yes: I consider it very good.

ALLENDALE TOWN.

Mr. W. Curry.

8 Oct. 1862.

15,882. Have you heard any complaints made within the last six months, or 12 months, of bad air? —None.

15,883. (*Mr. Austin Bruce.*) You have stated that you began to work as a miner at the age of 11 or 12? —Yes.

15,884. Are there any who begin to work as early as that now?—Not underground.

15,885. At what age do they begin to work now? —Thirteen; none below that.

15,886. Are there many who begin to work as young as 13?—We have not one employed in the mine, nor have had for years, at 13.

15,887. How many of your 300 workmen should you say were under 16?—Three; there is one in a bargain, a regular miner, and two employed as labourers under 16.

15,888. Then they rarely begin to work under the age of 16?—Not in the mines.

15,889. Are the labourers who work underground less subject to asthma than the miners?—Decidedly so, if they were confined to the same work always, but it very often happens when they are partly done with mining that they are put to easier work, such as wooding or underground labouring. I have here a paper showing the number of workmen employed at Allenheads, Swinhope, and Blackett level:—

The following Paper was handed in:—

Workmen employed at Allenheads, Swinhope, and Blackett Level, October 1862.

How employed.	Under 16.	Under 21.	21 to 30.	30 to 40.	40 to 50.	50 to 60.	60 to 70.	Total Pickmen.	Total Underground.
Pickmen - -	1	21	101	59	52	7	2	243	
Labourers underground	2	11	8	7	9	13	8	58	301
Master washers	–	–	–	–	–	–	–	17	
Boys - - -	–	–	–	–	–	–	–	75	92

Total in mines and washing floors - - - 393

Pickmen on Bingtale (or tributers) - - - 145
Ditto Fathomtale - - - - - - - 98
Underground labourers - - - - - - - 58

301

Surface shafts, exclusive of Blackett level - - - - 22
Underground do. do. do. - - - - - - 6

28

Length of horse levels open at Allenheads - - 9 miles.
Length of horse levels open at Swinhope - - 1⅝ miles.

10⅝ miles.

Length of waggon levels by men at Swinhope - ¾ miles.
Length of waggon levels by men at Allenheads 1¾ miles.

2½ miles.

15,890. Did you ever suffer yourself from breathing bad air underground?—Yes, I have.

15,891. Was that long ago?—Yes.

15,892. Have you ever known any of your miners suffer from breathing carbonic acid gas in the present mines?—I think not.

15,893. Are your men easily managed? — Very much so.

15,894. Are they sober?—Very steady indeed.

15,895. (*Mr. Holland.*) Do the men begin work here at an older age than they used to do?—They are older before they get work; there are none admitted to the washing floors before they are 10, and none into the mines before they are 13 years of age. One cause why there are so few under the age of 16 arises from insufficient employment to give them, or else more would have been employed.

15,896. How are those employed between the ages of 13 and 16?—In various ways; they are, generally speaking, employed on the washing floors. If we had more in the mines from the age of 13 to 16 the probability is they would have been blowing air machines, assisting woodmen, or if strong and healthy those near 16 years old in bargains.

15,897. Was it the practice formerly, or 20 years ago, to permit them to enter the mines earlier?—Yes.

15,898. Has there been an improvement in the health of the miners in consequence of their not going to work underground until older?—I cannot answer that question satisfactorily, but I think their health is improved.

15,899. You stated that you thought it was an advantage to draw the air out of a mine rather than to drive it in, as then the men escaped the return air? —Yes.

15,900. How does that happen unless you have a separate channel from each set of men outwards?—From the fact of there being only one drift, generally speaking, between the machine and the fore-end where the men are at work, and the air sucked out being confined in metal pipes or boxes along the said drift back to the machine, thereby forming a separate or artificial channel. In cases where other men are employed between the fore end and the machine, branch pipes are taken from the principal ones to each fore head, but these are very rare instances. These remarks are confined to fore ends only. But taking the whole mine this could not be accomplished.

15,901. The men going to and from their work would be exposed, you think, to breathing the return air if the air was driven in?—Yes.

15,902. And that is avoided by drawing the air out rather than driving air in?—Yes, in the ends where the most air is, but not generally throughout the mine.

15,903. How are the nine miles of horse levels open at Allenheads kept ventilated?—They are the best ventilated of any; they run into each other, and are in connexion with the surface shafts all along from which the whole mine is principally ventilated.

The witness withdrew.

Mr. THOMAS JOHN BEWICK examined.

Mr. T. J. Bewick.

15,904. (*Chairman.*) You are engineer of Mr. Beaumont's works?—Yes.

15,905. Have you different modes of ventilation in use in those mines?—Yes.

15,906. Will you be good enough to describe to the Commissioners the different means that you resort to?—They are both by exhaustion and propulsion by means of water-wheels or other motive power, driving fans and similar machinery; we have also recently introduced furnace ventilation. The plan adopted on the Blackett level here is so far entirely by exhaustion by Byrom's patent another fan, one of which is at work within three-quarters of a mile of this place, and also by a machine somewhat similar to Struve's system, this method is in operation close to this place. At Allenheads and other mines for propelling the air into the workings, we have the ordinary blowing fan, and a sort of bellows which is worked in a box with valves and likewise a piston working horizontally in a cylinder or box with valves. Under certain favourable circumstances we also occasionally ventilate by the water blast.

15,907. (*Mr. Austin Bruce.*) Is the air, in these cases, forced generally through the workings, or only into certain special close ends where the ventilation is imperfect?—Only into the special fore ends where there is no natural ventilation.

15,908. In the case of Struve's exhausting machine, is that applied only to special places?—Only in special airless fore-heads.

15,909. And how is it with regard to the furnace? —That applies to a district; it affects the general

ventilation of one large mine. Our machine ventilation is merely for special places. I may say that generally it only applies to close fore ends where there is no through communication. The furnaces that we have erected are for ventilating a series of levels and workings which extend over a considerable area, they are for exhausting at one point, and of course the fresh air enters the mine at the various inlets by its own gravity, and replaces the impure air that is exhausted by the furnace.

15,910. What quantity of coal does a furnace consume ?—About three tons a week.

15,911. What coal do you use ?—County of Durham coal, from the neighbourhood of Bishop Auckland.

15,912. What is the cost of that coal here per ton ?—At Allenheads it costs 14*s.* 3*d.* per ton, a thet Weardale furnace the cost is 17*s.* per ton ; the price of the coal at the pit is only about 5*s.* 6*d.* or 6*s.* per ton, but the carriage adds greatly to the cost.

15,913. What sort of furnace is it ?—The furnace is placed at or near the top of the shaft, which is closed, a communication is made in any convenient place down the shaft, and a covered air tight passage made from it to the furnace, which is simply a series of bars on which the fuel is placed, and at the other end of the bars is a chimney a few feet high ; at Allenheads it is 40 feet ; it was first tried 10 or 12 feet in height, and answered very well ; any moderate height is sufficient ; at the side of the furnace there is a door above the bars for feeding, and another below the bars to take out the ashes.

15,914. Have you calculated what addition was made by the furnace to the amount of air passing through the mine ?—No, but I may say that in one particular part of the mine prior to the furnace at Allenheads being lighted in July of last year the men in dull damp weather were frequently prevented from working by a want of ventilation, and since that they have not lost any work, and speak very favourably of the effects of the furnace.

15,915. The men, I suppose, would not leave work until the condition of the mine were such as to be injurious to their health ?—They would not.

15,916. How far off is the furnace ?—Upwards of a mile from a part of the working, and the levels are at different elevations and in various directions.

15,917. Before you had the furnace in operation a mile distant from them, there were places in which the men could not at times work ?—The places where the ventilation was so deficient prior to the erection of the furnace are three-quarters of a mile distant, but even at a mile the ventilation is improved.

15,918. Now the men are never hindered from working, and you attribute this entirely to the furnace ?—Yes, the improved ventilation is no doubt entirely due to the furnace.

15,919. Do you employ no other means besides this furnace for the ventilation ?—Except in airless foreheads no other artificial ventilation whatever,

16,920. It is all effected by this furnace ?—Yes. Two months after the furnace was first lighted we put it out, just to try whether or not it was beneficial in what we considered was favourable weather, that is to say, the temperature was low, and the wind was from the north ; the miners left their work as usual at 2 o'clock in the afternoon, the furnace was extinguished at five o'clock in the evening, and next morning at six o'clock when the men returned there were very few of them who could get to their place of work.

15,921. Is the shaft at which the furnace is, an upcast shaft for all the mines ?—Not exclusively so ; there are other upcast shafts ; since the furnace was erected it is exclusively an upcast, but it is not the only one at Allenheads.

15,922. Did you not state, that within the period during which this furnace has been in operation no mechanical means were ever used for driving air into the close ends ?—We almost invariably apply either manual or other power for the purpose of propelling air into the close ends, whether there is a furnace or not.

15,923. (*Mr. Davey.*) Which method do you most approve of, that of exhausting the air, or forcing it in ?—Exhausting it.

15,924. (*Mr. Holland.*) The exhaustive power is in proportion the height of a column 40 feet high ?—Yes, and the effect of the fire in the furnace.

15,925. The chimney is 40 feet high above the fire ?—Yes, we have one in Weardale only seven or eight feet high.

15,926. Is it not a weak draft ?—No, it creates a good brisk draft.

ALLENDALE TOWN.
Mr. T. J. Bewick.
8 Oct. 1862.

The witness withdrew.

Adjourned to To-morrow at Allenheads.

ALLENHEADS.

Tuesday, 9th October 1862.

PRESENT :

NICHOLAS KENDALL, Esq., M.P.
JOHN ST. AUBYN, Esq., M.P.
H. AUSTIN BRUCE, Esq., M.P.
RICHARD DAVEY, Esq., M.P.
P. H. HOLLAND, Esq.

RICHARD DAVEY, Esq., M.P., in the Chair.

[The Commissioners inspected the Allenheads mines, after which they inspected and entered the Burtree Pasture mine, in the Weardale District, and at the latter mine they took the following evidence.]

Mr. JOSEPH COWPER CAIN examined.

15,927. (*Chairman.*) What is the name of the mine which you superintend ?—I do not superintend any particular mine ; I go through the whole of Mr. Beaumont's mines.

15,928. You are the general overlooker ?—I am called surveyor.

15,929. How many men do they employ in this mine ?—365 men and 100 boys ; that is the total.

15,930. What proportion of those would be pick men ?—362 men and boys are employed underground.

15,931. I need not ask you the manner in which you let the work or the wages, because we have had that before from the other mines in which Mr. Beaumont takes an interest ; it is the same, I presume ?—It is the same.

15,932. What is the longest level which you have ?—Burtree Pasture is the longest ; it is two miles within 11 fathoms.

15,933. The work is brought out by horses ?—Yes.

15,934. What is the depth under that level which you have been working. If I understand you rightly the present end is about 105 fathoms from the surface ?—Yes.

ALLENHEADS.
Mr. J. C. Cain.
9 Oct. 1862.

ALLENHEADS.
Mr. J. C. Cain.
9 Oct. 1862.

15,935. Have you made a shaft under it?—Yes, of 131 fathoms.

15,936. How many levels have you under the one which we have gone into?—Five below the horse level.

15,937. How are those ventilated?—By the air going in at the two level mouths. The shaft above the engine shaft supplies the water to the engines, the water-wheels, and it is divided and goes along those different levels, and then out of the shaft at Middlehope Head, at the top of which the furnace is lighted.

15,938. Have you any of those lower levels which are deficient of air?—No; there are none more deficient than the one which you have been into to-day, at the end.

15,939. Do you use artificial means to carry the air into those levels?—We use none, excepting what is blown from the last rise or sinking to the ends, and that is done by hand by boys.

15,940. By hand-blast?—Yes.

15,941. You have recently erected a furnace for better ventilation?—Yes.

15,942. What has been the result of that?—It has only been lighted four or five days, and so far the result is very beneficial, apparently; but it has not been lighted a sufficient length of time yet to enable us to judge of the change which may take place.

15,943. But are there times when you cannot enter the horse level for want of air?—Yes; several times lately, we could not do so for want of air.

15,944. Consequently the men could not follow their daily work?—They could not.

15,945. From what you have seen of other mines do you think there is every chance that this furnace will remedy the defect?—I have every confidence that it will answer there and ventilate the mine effectually.

15,946. Have you seen it at work in other mines?—Yes; at Allenheads mines for upwards of a year.

15,947. And that has been very satisfactory?—Very satisfactory indeed.

15,948. Do your men suffer much from working in these close ends?—Not a great deal; not so much as might be calculated upon.

15,949. Have you many at this moment who are off their work from illness?—Very few; there are not more than two or three altogether out of the whole number.

15,950. Is that caused by what you term the miners' disease, or from any other cause?—I think other complaints; it is not caused by the miners' complaint; I do not think that we have a single one at present who has the miners' complaint. We may have old men who are really not fit to go in any more; but then old age and the length of time that they have worked are the causes of that.

15,951. What is the age of the oldest man that you have working?—73.

15,952. Have you any working above 50?—A great number; we have 85 above 40. In the Weardale district there are 102 shafts, from 3 to 105 fathoms in depth. The total length of levels is 20,609 fathoms, being $23\frac{1}{2}$ miles; the price is from 2*l.* 10*s.* to 20*l.* per fathom; $14{,}813\frac{3}{4}$ bings of lead ore is the average produce for 5 years ending the 30th June 1861. There is a total of 1,133 men and boys, of whom 877 men and boys are underground; of the latter number there are 49 under 16, 106 under 21, 281 under 30, 182 under 40, and 259 above 40. Of the 877 there are 469 on bingtale, and 408 on dead-work, labourers, rail-layers, trappers, &c.

15,953. There is a large proportion of your men above 40?—Yes.

15,954. Have you any continuous ladders going from the horse level?—They are continuous, but there is a little distance sometimes between the different stages for the different levels; but they may be considered continuous.

15,955. What is the length of a ladder?—Generally 12 feet.

15,956. Have you a stage at the bottom of each ladder?—Yes.

15,957. What is the inclination of the ladder for climbing?—I could not state it in figures, but it generally goes half-way through the shaft across the way gate.

15,958. How wide is the shaft?—Perhaps 5 or 6 feet.

15,959. Then it would be about $2\frac{1}{2}$ feet in 12 feet?—Yes.

15,960. Do the men complain at all of climbing the ladders?—Not at all. I have not heard of any complaints.

15,961. Do they suffer much from climbing?—I do not know that they suffer a great deal; they must suffer from it of course.

15,962. You have no means of putting a man engine, or a skip, or anything of that kind below, to let the men down?—We have not adopted anything here. At Slittshaft, a mine further down the district, we are preparing means. There has not been anything employed here yet; but at the fore end, where they are about to put in the engine, it will be adopted with the skips or cages.

15,963. In fact you have no means of doing it at present, because you have no top to your shaft?—Not at present, but that will be put in operation within 12 months in the fore end.

15,964. In the limestone do you find that you get air cracks?—There are a variety of cracks, and no doubt air cracks, because the air is sometimes felt; small quantities come out of those cracks, and it has some little effect upon the light.

15,965. Did you ever find it have any effect upon the men?—No, I never did; and I cannot say that I ever saw it have much effect upon the light here. I have seen it in other mines have a great effect; but I think that this mine is very free from the carbonaceous gas.

15,966. You have never seen anything so bad that a miner has been obliged to be pulled out?—Never; we have not had any instance of that sort, indeed it is very free from it. One has known instances of men having been pulled out, and having been killed from it; that is to say, in other districts, not in Weardale. In Alston Moor there were two or three cases.

15,967. Your men work eight hours' shift?—Yes.

15,968. They have, of course, a great deal of spare time?—They have.

15,969. Have they any recreation?—Yes; they generally try to find something to engage their attention at times when they are not working.

15,970. Will you state what the recreations are?—Farming is one of the principal what they consider recreations. They work about little farms and gardens; some indulge a little in cricketing.

15,971. Is there a cricket club?—Yes; agriculture and gardening are the chief recreations.

15,972. Are there agricultural societies?—We have one here in Weardale.

15,973. Which is supported by the miners?—Yes.

15,974. Have you also a horticultural society?—Yes.

15,975. Which is also supported by the miners?—Yes.

15,976. (*Mr. St. Aubyn.*) Is that subscribed to by the working miners?—Yes; they pay their shilling or their 2*s.* 6*d.*

15,977. (*Chairman.*) You think that the recreation which they have above the surface considerably improves their health?—I think that it has a very beneficial effect upon their health; it improves their health generally.

15,978. (*Mr. St. Aubyn.*) The end in which the Commissioners were to-day is 40 fathoms from a rise?—It is.

15,979. How far do you expect to drive before you get fresh communication?—Perhaps another 10 or 15 fathoms; much depends upon circumstances.

15,980. That would be from 50 to 55 fathoms?—Yes.

15,981. You have it in contemplation to put in a trap door in the horse level where we were to-day?—We have it in contemplation to put in several, but particularly one in that part of the mine which you visited, which I think will have a very beneficial effect.

15,982. Is it usual to drive so far as 50 fathoms from a rise without additional air communication?—Yes, it is usual; but when the ground is productive it is put up at 20 fathoms, but that is done for the convenience of working more than for ventilation; 50 fathoms is not a great distance for ventilation.

15,983. Was the state of the air in the end where the Commissioners were to-day a fair specimen?—I think it is a better specimen than we have had for the last three months, but I think that to-day the end is very near what might be called an average specimen.

15,984. Do your men complain at all of the bad air in those ends?—Only when they cannot work; they complain that they cannot get in to work.

15,985. In your opinion do they continue working for the sake of their bargains after the air has become too bad for them?—I should think that lately they have done so in this particular mine.

15,986. Do you exercise any control over them in that respect?—We have not done so.. We generally leave it to their own discretion; we do not force them to stop longer than they really should when the air is really bad; we do not exercise any influence over them when they find that the air is not fit to work in; we leave it entirely to their own discretion.

15,987. Are the miners generally under your superintendence subject to accidents?—No, not at all; or at least very seldom. If it is the case it is chiefly from their own carelessness.

15,988. You have scarcely any accidents from falling away from the footways?—No, it is of very rare occurrence.

15,989. Nor from the falling away of ground?—That is equally rare.

15,990. Nor from blasting?—We sometimes have an accident from blasting, but it is very rare. I believe that there have been only two since I came to the district, which is 4½ years, and there are a great number of men.

15,991. In those two instances was the cause to be ascribed to the men's carelessness?—I think not, I think it was purely accidental, simply from the fact that the holes which they were boring were in broken ground, lime-stone, with a little iron in it; the powder got lodged and did not get to the bottom of the hole, and the powder got fired in tamping.

15,992. You do not use the safety fuse?—Very little indeed, chiefly from the fact that it creates such a disagreeable smell, and more smoke than an ordinary squib.

15,993. I understand that in this district the men object to the safety fuse on account of the smell which it creates?—Yes, it would be necessary to enforce it if it were used, on that account. In addition, there is an extra quantity of smoke.

15,994. In case men are temporarily or permamanently disabled from causes connected with their work, how are they provided for?—In this district they have two clubs, but they are not at all connected with the works.

15,995. They are open to agriculturists as well as to miners?—Yes, to every class. One is the Odd Fellows and the other has been of long standing.

15,996. Is any contribution made by the proprietors of the mines in this district towards a sick fund for the men?—No.

15,997. Nor towards an accident fund?—No.

15,998. All the assistance which the men derive in case of accident arises from their club funds?—And from the parish.

15,999. How is that there is no club in connexion with the mines?—I believe the principal reason is that the rules were not exactly what Mr. Beaumont considered a sufficient guarantee, or at least what he would like; that if he supported a club at all he would wish to have the rules to his liking.

16,000. Then there was a proposition to establish a club?—There was at one time and those clubs were got up without paying attention to any proposition which was made from Mr. Beaumont or Mr. Sopwith.

16,001. From whom did the proposition to establish these clubs come?—I am not in possession of sufficient information to give all the particulars, but I should think that it would come from Mr. Sopwith. They had an old club, and Mr. Sopwith proposed to make it similar to the Allenheads Benefit Society, provided they would have it under certain rules and regulations.

16,002. And that was declined by the men?—Yes.

16,003. In fact the proprietor and the men did not agree about the rules?—I fancy that that was the case.

16,004. We saw to-day at Allenheads Mine the men ascending and descending by means of a cage with a wire rope, where there was a top to the shaft, do you intend to carry that out in this mine also?—The same system is proposed to be adopted and is being carried out at some of the shafts here which is already in existence at Allenheads.

16,005. Namely cages and wire ropes?—Yes, the same sort of machinery.

16,006. Is it in contemplation to erect that generally in the mines in this district?—I cannot say that; there is one shaft which has been fitted up very similar to Allenheads, upon the principle that is adopted at Allenheads, with hydraulic engines and lowering and raising the men by skips or cages.

16,007. Have you any reason for adopting the cage in one shaft and not in another?—There is no particular reason excepting that that improvement has not taken place in the whole district which is carried out in Allenheads, which it is very likely intended by degrees to carry out.

16,008. In your opinion, then, the cage and the wire rope is an undoubted improvement upon the footways?—Yes, I think that it is an improvement to the pathway

16,009. (*Chairman.*) I suppose one reason is that you have not a shaft here which will suit that?—It is not sufficiently large, and it is not adapted to the purpose, but we are fitting one up in this mine exactly similar to what is carried out at Allenheads, that is near the fore end.

16,010. (*Mr. St. Aubyn.*) Where the shafts suit it is the intention to fit up cages?—I cannot say what the intention is, but from what has really been done it appears to me that that is very likely the intention.

16,011. And in your opinion where it can be done it is preferable to the footways?—Decidedly.

16,012. (*Chairman.*) I think you have had said that you are the general surveyor?—Yes, of what are called the W. B. mines. I go through the whole of those mines.

16,013. What is the condition of Greenlaws mine so far as regards ventilation?—It is considered to be in a good state of ventilation.

16,014. You think better than this?—I think so; there is not the same extent of workings opened out.

16,015. Have they a horse level there?—Yes.

16,016. Have they any sinking below that?—No, the workings are all above the horse level.

16,017. Have they any cross drifts in search of veins or deposits?—There are several cross drifts.

16,018. And those are well ventilated?—Yes, all of them are very well ventilated, at least upon the whole you may consider it to be in a good state of ventilation. There may be little ends here and there which are a little smoky now and then, but not the usual course; it is only the powder smoke which stays a little before they get a hole through to the other places to cause a ventilation.

16,019. Then you do not use a blast there?—Not where it is not very bad, but where it is very bad we put in the blast at once.

16,020. At what angle would you hold your candle

ALLENHEADS.

Mr. J. C. Cain.

9 Oct. 1862.

when you consider the air very bad?—The best position of the candle for working in bad air is to put it rather more than horizontal, but I consider that whenever there is the slightest inclination of the candle the air is not good.

16,021. Do you not think that it would be very prejudicial for the men to work in air where you are obliged to put the candle in that position?—I should think that it would be very injurious.

16,022. And it would cost you a very trifling expense, I presume to put a blast in those ends?—We generally adopted the blast when it is necessary to put the candle in that position or nearly in that position.

16,023. But not before?—Even before that perhaps; much depends upon the state of the smoke and the air as regards putting the blast in; the smoke is the worst thing to deal with in those cases in the ends.

The witness withdrew.

Mr. JOHN WALTON examined.

Mr. J. Walton.

16,024. (*Chairman.*) What position do you hold in this mine?—Mine inspector under Mr. Cain.

16,025. Have you been here long?—Nineteen years.

16,026. I have asked Mr. Cain the principal part of the questions which we think it desirable to put, which you have heard. What is the condition of the men now compared with what it was 19 years ago?—I think the condition of the men is better now than it was 19 years ago.

16,027. You have lately put up a blast furnace for the purpose of ventilation, have you had it long enough to give any idea what the effects of it are?—There is no doubt that there is an improvement since it was put up.

16,028. There has been already an improvement?—Yes.

16,029. Before that furnace was erected it was frequently the case that men were obliged to retire from the work?—Yes, often during the July, August, and September months.

16,030. In going through this level since the furnace has been erected, do you not find it much cooler?—Yes, it is much cooler.

16,031. You went in with us?—Yes.

16,032. Did you hear the expression from a miner who was waiting there that he was nearly frozen from waiting so long?—Yes; I heard him make use of that observation.

16,033. Did you ever hear that observation before?—No.

16,034. From the horse level you go down 131 fathoms?—Yes.

16,035. Did you ever hear any complaint from the men of climbing that ladder?—No, I never heard them complain of the climbing.

16,036. They do not climb continuously?—No, they have stages of so many fathoms, and then they take a rest.

16,037. I do not mean continuously in the shaft, but do they go to a rise and then to a level and then rise again?—Yes.

16,038. Therefore it is not continuous from the shaft?—It is not.

16,039. What is the general condition of the men now in this mine, in your opinion?—All of them seem to be very healthy. I do not suppose that we have had one off work from sickness for a considerable length of time in this mine.

16,040. Not arising from working in the mine?—No.

16,041. But from other causes?—From other causes.

16,042. How do the miners live, have you ever seen anything of the mode of their living in their cottages?—Yes; they live well.

16,043. Just as well as an agriculturalist would live?—Better.

16,044. In what respect do they live better?—I think they use more animal food than is used by agricultural labourers.

16,045. Probably they have better wages?—They have better wages.

16,046. What kind of food do they eat?—Beef and mutton principally.

16,047. What is the price of the beef and mutton?—7½*d.* and 8*d.* a lb. at the present time.

16,048. Most of the miners have some little land of their own?—Yes; small farms, either as owner or tenant.

16,049. What extent of cattle do some of them keep?—Two or three cows, some of them have as many as four cows.

16,050. And they take great delight in their farms?—Yes, they do.

16,051. And they support the agricultural meetings?—Yes.

16,052. And they show their cattle?—Yes.

16,053. They have also horticultural meetings?—Yes.

16,054. And they exhibit the produce of their gardens?—Yes.

16,055. And in fact the society is supported almost entirely by the miners themselves?—Yes; in a great measure.

16,056. Do they get any support from the neighbouring gentry or proprietors?—Yes.

16,057. What are their amusements in the 16 hours they are off work?—The young men chiefly play at cricket, wrestle. During hunting season they sometimes go off with the hounds.

16,058. They run after the hounds?—Yes.

16,059. For hares, I suppose?—Yes, harriers.

16,060. Have they any reading room here?—Yes; a reading room at Newhaven, and several good libraries.

16,061. I suppose that almost all of them can read?—Yes, most of them.

16,062. Are the schools here the same as at Mr. Beaumont's other mines?—Yes.

16,063. Who pays for them?—Mr. Beaumont, in a great measure.

16,064. Do the children pay anything themselves?—Yes.

16,065. What?—6*d.* a month for tuition, and pay for books and other school material.

16,066. But the men do not subscribe?—They do not subscribe.

16,067. Can you state about what proportion the children pay and what proportion Mr. Beaumont pays for the schools?—Mr. Beaumont pays 100*l.* a year and the scholars pay something like 70*l.* towards one school in the district.

16,068. Who built the school?—The school building was erected by subscription. Mr. Beaumont paid the largest proportion of it, and other individuals and the miners also contributed; nearly the whole of them subscribed about 10*s.* each.

16,069. Is Mr. Beaumont the proprietor of the surface about here?—No.

16,070. Then the other owners of the land subscribed for the schools here for the benefit of the miners?—Yes, they subscribed a small portion. Mr. Beaumont was considerably the largest subscriber, and he gave the land too.

16,071. (*Mr. St. Aubyn.*) So far as your judgment goes, is anything omitted which ought to be done towards insuring the safety of the miner under ground?—No.

16072. Or towards making him comfortable above ground?—No.

16,073. (*Mr. Kendall.*) Did you ever know a suggestion for the miners' benefit which was not attended to?—No.

16,074. (*Chairman.*) You have heard the evidence which was given by Mr. Cain, and you have given your own; is there anything which strikes you which you would like to mention to the Commissioners?—No.

16,075. (*Mr. Austin Bruce.*) I suppose that the men here suffer from a difficulty of breathing much in the same degree as they do at the other mines?—Yes, they do.

16,076. Do you think that there are many men who have worked up to the age of 40 under ground who are free from more or less difficulty of breathing?—Great numbers of them in this district are quite free from it.

16,077. What proportion of them should you think are quite free?—I should think more than half of them.

16,078. (*Mr. Holland.*) You mean half of those above 40?—Yes.

16,079. (*Mr. Austin Bruce.*) What number of men are working under ground in this mine?—Three hundred and sixty-two men and boys.

16,080. Have you taken the numbers above 50?—No.

16,081. Can you form any estimate of those above 50?—No.

16,082. In the mine of which you have charge, are there many men working above 50?—Yes; there are a good many

16,083. Are there any working above 60?—Odd ones.

16,084. How many, should you think?—There is 25 above 60, and one 73.

16,085. Is he still a hale man?—Yes.

16,086. Does this man work in the deep levels or in the shallow levels?—He is working at Greenlaw's mine.

16,087. At what depth below the surface?—Where he is at the present time would be, perhaps, 25 fathoms below the surface.

16,088. Do the elder men ever ask to be placed to work in the shallower levels?—Yes.

16,089. So as to be relieved from the fatigue of climbing?—Yes.

16,090. Do you always attend to that request when it is made to you?—Always.

16,091. How are the men in this district with respect to sobriety?—They are very steady men.

16,092. There are not many public-houses here, are there?—There are considerably more public-houses in this district than there are in Allendale.

16,093. Do you believe that in consequence of the great number of public-houses the men are less sober than they are at Allenheads?—No; I do not think but what they are as steady here as they are at Allenheads.

16,094. Who support the public-houses in this neighbourhood?—The market is held at St. John's Chapel, it being the centre of the district, once a month, and tradesmen from a distance meet their customers at the public-houses for payments and orders.

16,095. Have you any drunken workmen?—A few.

16,096. Are there any portions of this mine where the air is decidedly less good than in the others?—The only place where it is worse than in the other mines is where we have been to day; but it is improved by this furnace, and is much better.

16,097. In those places are the men able to work for the whole of their ordinary time?—In nearly the whole of the mines they are, with the exception of this place.

16,098. I ask whether, in those places where the air is less good than it is usually, the men are able to work their usual day's work of eight hours?—No; they are not able.

16,099. How long do they work there?—They are not restricted; they use their own discretion in a great measure where it is bad for air we do not force them to stay.

16,100. They work a shorter or a longer time, according as they feel that they are able to bear it?—Just so.

16,101. Have you ever known men the worse in health from continuing to work in that bad air longer than they ought to have done?—No.

16,102. Is there any escape of gas into the levels from the rock?—Very little; I have scarcely ever seen that.

16,103. (*Mr. Kendall.*) The miners pay, I understand, 6*d.* a month for their children?—Yes; for those who attend school; they also pay for their books, &c., required.

16,104. Whatever age the children are?—Yes.

16,105. Until how old do they generally stay at the school?—11 or 12.

16,106. How early do you employ them here?—Above 11 years of age.

16,107. Not under?—Not under 11.

16,108. Do you find that the miners are anxious for their children to go to the school, or not?—Most of them are anxious, up to that time.

16,109. The moment they can earn anything, then they become anxious to employ them?—If they have large families they like to have them employed.

16,110. To help towards their maintenance?—Yes.

16,111. The children are examined, and you have prizes, and so on, I suppose?—Yes.

16,112. Do the miners or their families attend the examinations?—Not many of them.

16,113. Are they invited to do so?—They are invited.

16,114. Is it open to them to attend if they like?—Yes.

16,115. Some of them do attend the examination? Not often.

16,116. Who attend, generally, when the prizes are distributed?—Mr. Sopwith attends.

16,117. Who conducts the examination?—The schools are examined by the Government inspector annually and by Mr. Sopwith, and a committee appointed for that purpose.

16,118. The prizes are awarded more by ticket than by examination?—By both.

16,119. Do the miners enforce their children going to school pretty regularly?—Yes; they go very regularly.

16,120. (*Mr. Austin Bruce.*) Are there Sunday schools here?—There are several Sunday schools, but not in connexion with Beaumont's schools.

16,121. They are maintained by the different denominations?—Yes; Wesleyans and Primitive Methodists.

16,122. Do all the children go there?—A very great number of them.

16,123. (*Mr. Holland.*) You have said that the men here are generally healthy?—Yes.

16,124. I see by this table which you have given that 436 are under 30, and 441 above 30 years of age, how do you account for the small proportion of men above 30, namely, only half; do they leave the work?—Not many have left the work, excepting those who have emigrated to Australia.

16,125. Have a very large number left?—Not latterly.

16,126. Do they leave work, generally, from any other cause than from falling out of health and emigration; do they often go to other employments?—A few who have left have gone to the iron-stone workings.

16,127. Do a very large proportion who are above 30 go to other employments?—Not a great number.

16,128. Those who cease to be miners generally do so, I suppose, because they are out of health?—Several have left and begun in business.

16,129. What sort of ill-health is it which makes them give over mining; is it being touched in the wind?—I do not know.

16,130. (*Mr. Kendall.*) If fresh men come to offer to work do you give the preference to young men over old men; to men under 30 rather than men above 30?—Preference is given to the young men, certainly.

ALLENHEADS.
Mr. J. Walton.
9 Oct. 1862.

16,131. Of those whom you take in during any month in the year, are there more under 30 than there are under 40; out of the last quantity of fresh men whom you have taken in, are there more under 30 than there are under 40?—More under 30.

16,132. (*Mr. Holland.*) Is not that the case in all employments?—Yes.

16,133. (*Mr. Austin Bruce.*) Are the men much given to change their work; do they come and go here?—No; they are principally inhabitants of the district.

16,134. Do you take in many strangers in the course of the year?—No; we principally employ just those who belong to the district.

16,135. The workmen employed in the mine are a very fair sample of the workmen in the district with respect to ages?—Yes.

16,136. (*Mr. Holland.*) I understand that most of your miners begin as boys and work up?—Yes.

16,137. But those who come in as men are young men?—Yes; but there are very few of those.

16,138. Do young men who begin mining at 20 and upwards preserve their health better than those who begin very young?—Those who begin to go underground above 20 preserve their health better.

16,139. (*Mr. St. Aubyn.*) Do you agree in the opinion expressed by Mr. Cain that it is very desirable to establish the use of cages and wire ropes where it is practicable, instead of the footways?—Yes.

16,140. And it is being done as fast as is convenient, is it not?—Yes, it is.

16,141. (*Mr. Kendall.*) Have you ever known of any accident in cages?—No.

16,142. (*Mr A. Bruce.*) What number of men have you at this moment working in places where the ventilation is in your opinion imperfect?—Not more than 20 in this particular mine.

16,143. (*Mr. Holland.*) Are your mines free from dust?—Most of the places are free from dust.

16,144. Are the men annoyed at all by breathing dust?—Not a great deal.

16,145. Are the men much subject to rheumatism in this neighbourhood?—No.

16,146. In speaking of your men as being healthy, you mean that they are healthy for miners?—They are very healthy men.

16,147. Do you mean as healthy as those who work upon the surface, or that they are very healthy for miners?—They are very healthy as miners.

16,148. But not so healthy as agricultural labourers?—Scarcely that, I think.

The witness withdrew.

Adjourned to To-morrow at Middleton.

MIDDLETON.

Friday, 10th October 1862.

PRESENT:

The Right Hon. Lord KINNAIRD, K.T.	H. AUSTIN BRUCE, Esq., M.P.
NICHOLAS KENDALL, Esq., M.P.	RICHARD DAVEY, Esq., M.P.
JOHN ST. AUBYN, Esq., M.P.	P. H. HOLLAND, Esq.

The Right Hon. Lord KINNAIRD, K.T., in the Chair.

ROBERT WALTON BAINBRIDGE, Esq., examined.

MIDDLETON.
R. W. Bainbridge, Esq.
10 Oct. 1862.

16,149. (*Chairman.*) I believe you have the charge of the London Lead Company's mines in this district?—Yes, and in the North generally.

16,150. Will you be good enough to name the different districts?—Teesdale, Alston Moor, Westmoreland, and Weardale.

16,151. What are the names of the mines here?—The Teesdale district, I think I would call it.

16,152. Are they lead mines?—They are; and the major part in the hands of the Lead Company; but there are other small companies in the district.

16,153. Can you tell us what number of men are working underground is this district?—In Teesdale we have 470 pickmen working underground.

16,154. Do the royalties belong to one Lord?—The chief of them belong to the Duke of Cleveland, another part belongs to Mr. Hutchinson, and a very large district, although we are not working it extensively, to Mr. Bowes, the late member for South Durham.

16,155. Do you confine your workings to the Duke of Cleveland's?—No; we work in all of them.

16,156. Are the mines entered by a shaft, or by a horse level?—By horse levels generally; indeed, I think I may say almost exclusively.

16,157. What is the longest horse level in which you are working?—Some 400 or 500 fathoms; longer when you take the line of the level in the course of the vein. In driving the adit from the valley, we reach a number of objects on the road; and in each of those objects we drive a branch level when reached.

16,158. Are there many adits driven for the purpose of ventilation alone?—Yes; in order to effect an opening to a pre-existing level or shaft, I may say, generally, that when we set on a level it is seldom for the purpose of covering only one object; we, generally speaking, know of the existence of a number of veins before us, and on our reaching the first vein, if it be of sufficient magnitude and of a fair mineral character, then we rise to the surface, not only for ventilation, but for proving the character of the vein in all the strata between the level and the surface; we follow up the vein according to the course of the lode.

16,159. Do you then work it as a rise, or do you put in another level?—We rise, in the first instance, to the surface for ventilation, and after we have done that, then we drive in the course of the vein at the same random as the original level, and into that level we put a horse and waggons always. Suppose we find, in the course of our rise, in the different strata through which we have passed, ore yielding indications, then we put on, from the rise, drifts in the course of the vein; and between such drift and the horse level, and also the surface, frequent communications are made for ventilation and other purposes. As each vein is reached a like procedure takes place. Generally speaking in mining we find some of the strata ore-yielding and some not; as a general rule, it may be said that the plate beds are not ore-yielding; there are exceptions.

16,160. Is it limestone generally?—We have alternating beds, both of limestone and sandstone.

16,161. Which contains the most?—We have more ore out of the sandstones in Teesdale, and in Alston Moor, more out of the limestones; that is a general fact; we find both productive, but we have raised and are now raising, a much larger proportion of ore out of the sandstones than out of the limestones.

16,162. Are you obliged to use much timber?—Yes; we use a large quantity of timber.

16,163. Is it the limestone or the sandstone that requires most support?—The sandstone in general.

16,164. Do you make arches?—We always arch our levels with stone arches, as a matter of course, that is our horse levels. I may say that universally we arch our horse levels, and we arch such opening drifts above as we conceive are likely to be of permanent use.

16,165. How do the miners enter the mines, and how do they come out?—By the horse level, although that depends upon the convenience of their own residences. Some of the men may have, from their own residences, to come out over the summit of the hill, and in that case they go down the shafts.

16,166. When they go down the shafts, do they go by ladders?—Yes; not by buckets.

16,167. Do you mean by stempling?—Not by any machine, we have ladders; it is not by stempling.

16,168. What is the greatest depth that the men may have to go down in any shaft?—You may take 20 fathoms as the utmost extent, it is very often much less.

16,169. You would not think it desirable to have stempling?—No, I should think not; those stemplings are very apt to rot at the ends that go into the rock, and they might break almost without the knowledge of the parties that they were so near the point of breaking.

16,170. (*Mr. Holland.*) They are dangerous and also uncertain?—Yes, after a certain length of time; they are safe in the first instance.

16,171. (*Chairman.*) You would consider it a dangerous mode to adopt?—Yes, I consider it an objectionable mode of ascending and descending a mine, and such as we do not at all adopt in our present mines.

16,172. Have you got iron steps to the ladders?—No; flat wooden staves.

16,173. Are they tenoned into the uprights?—Yes, into the sides.

16,174. When you use ladders, what divisions are there, or sollers?—We have divisions where one side of a shaft has to be used for the men ascending and descending, and the other side has to be used for the purpose of putting down the work.

16,175. They are divided, are they?—Yes, they are; but in general we endeavour to get what we call our hoppers; between the place where the men are working and the horse level, we have these at every 10 fathoms, and these are not used for the men to ascend or desend by; but exclusively for putting down the work.

16,176. (*Mr. Austin Bruce.*) If a man were to fall in your 20-fathom shaft, how many fathoms might he possibly fall without being stopped?—To the end of the ladder; I believe the length is about ten feet.

16,177. At the end of each ladder is there a stage to prevent a man falling?—Yes.

16,178. What is that called?—We call it the landing.

16,179. (*Chairman.*) Is your mine a wet mine in any part of it?—Some of them are wet and some dry; they vary very much in that respect.

16,180. In a wet mine what means do you resort to to get rid of the water?—It descends into the horse level; we have pumping occasionally; in our Little Eggleshope or California mine we have pumping.

16,181. How is the pumping carried on?—By hydraulic pressure; we have no steam power, but an upright column of water.

16,182. That works the pumps?—Yes.

16,183. Is that sufficient?—Quite sufficient to relieve the mine of the water.

16,184. Are the bargains of the mine let quarterly?—Yes.

16,185. Do the men receive any monthly allowance?—Yes; merely subsistence, and the balance is paid at the end of the year.

16,186. What is the monthly allowance made to the miners?—44*s.* per month, or 11*s.* per week.

16,187. If a man gets into arrear, is that carried on into the next year?—Yes, we carry the balance on against him to the next year.

16,188. (*Mr. Austin Bruce.*) The whole of it?—Yes, we always carry the whole of the balance on against him.

16,189. (*Chairman.*) Does it often happen that there is a balance against a man?—No, by no means; decidedly the minor portion of our men have no balance; by far the larger proportion have a balance to receive at the end of the year.

16,190. (*Mr. Austin Bruce.*) On what theory of wages are the bargains made; what is it expected that a man may fairly earn?—Our basis is 15*s.* a week clear, for five eight-hour shifts; but the basis fluctuates according to the state of the times, and according in the price of provisions.

16,191. (*Mr. Kendall.*) If there is a balance against a man, is that carried on into the next year?—Yes, invariably.

16,192. (*Chairman.*) Will you describe to the Commissioners the way in which the ground is valued when you make the bargains?—As between the masters and the men our system is this:—we send not fewer than five agents to each working, throughout the whole of the mines; and, generally speaking, I have two sets of five agents going on with their view at the same time, and that is done with the object of saving the time of the men. Formerly one set of agents used to view all the mines, and it took them a fortnight to complete their work in this district; but for some years past, instead of having one set of agents going, I have had two sets to view, and we are able to accomplish all our bargain arrangements within a week. As a general rule, the men do not work at the time that the view is going on, so that we have a loss of time, a loss of time to the masters, and a loss of time to the men also; and, with the view of occasioning to both the Lead Company and the workmen the least possible loss of time, I now accomplish all the views and the bargain-letting within a week in each of the districts. I have two sets of men who travel, and to each of these sets I give its own peculiar department; that is to say, I would send five to one mine on one day, and five to another mine on the same day; and these agents are not exclusively the local agents, but they are drawn from the different districts. I should have all our Teesdale agents travelling, and I should have agents from Alston Moor, from Westmoreland, and from Weardale; mingling the home agents and the stranger agents together; and in that way all possibility of partiality, and all possibility of any improper dealing between the local men and the miners, is prevented. To each of these parties I give the basis of the wages, upon which they are to give their opinion, so as to bring out the net earning of 15*s.* a week to each man, for five eight-hour shifts, of free and skilful exertion. Then, having that basis, each of those parties goes to a mine and views the place, and considers what the rate ought to be for the bargain, and he enters that in his own book or sheet, which he delivers to me independently of his fellows.

16,193. Do they not consult together?—I presume they may in some cases of difficulty, or where it is desirable that they should be possessed of local information, they may in some cases talk with each other; but, as a general rule, they do not. Supposing that the local agent may be presumed to have better knowledge than any stranger, I conceive it to be his duty to bring under the notice of all his fellows everything that he conceives they would not be acquainted with without his communication to them.

16,194. The object, I presume, is to obtain independent opinions; and, upon the whole, you think you obtain them?—Yes; as a general rule I believe they do not consult. I do not conceive that it is improper that they should consult on some particular occasions.

16,195. Has this system been in operation for some time?—Yes, before I came into the concern. I

MIDDLETON.

R. W. Bainbridge, Esq.

10 Oct. 1862.

apprehend that it has been in operation for the last half century.

16,196. Supposing there should happen to be a great difference of opinion, what is done then?—Then I have to arrange it myself. After I have obtained all their opinions, I then form my own figures founded upon their opinions; and my own practice generally is this: I take the figures and add them together, and divide by five; or I take the highest and the lowest, and take the mean between the two; then I look to the parties in whom I have the greatest confidence, to see how their figures bear upon that, and I fix my own accordingly. I exercise my own judgment, guided by the judgment of those different parties. I am not bound by those figures, but I use their judgment in forming my own.

16,197. Has this system worked beneficially with reference to the owners of the mine?—I conceive that it has.

16,198. Has it given satisfaction also to the men?—Yes, it has; no system could possibly be devised that would keep the agents more independent of the men, or the men more independent of the agents; supposing that a local agent had a pique against a partnership, his pique would be corrected by the opinions of the others; or supposing that he had any favouritism towards them, then his favouritism would be corrected by the independent opinions of the others.

16,199. And upon the whole it has given satisfaction?—Yes, decidedly so; I believe that both the masters and the men are thoroughly satisfied, and that the judgment thus formed is sound; I may state that the results generally come out very closely approximating to the basis that I have given.

16,200. (*Mr. Kendall.*) Have you made an average of the wages in the last year?—Yes.

16,201. What was the average?—It was 2*d.* below the basis, it was 14*s.* 10*d.*; occasionally it will come out some 2*d.* or 3*d.* or 6*d.* above the basis.

16,202. (*Chairman.*) Is that for working by the fathom?—By both weight and fathom; we have two systems, one is to pay them by the amount of ground cut, and the other to pay them by the amount of ore raised.

16,203. What proportion should you say that the men in this district are paid by the amount of ore raised, and what proportion by the fathom?—I should say that three-fourths of the miners are paid by the amount of ground cut in this district; we are guided in that respect very much by the state of the vein, whether it is a wide or a narrow vein, or otherwise.

16,204. When the payment is made by weight, is the value of the ore taken into consideration?—No, not the market value of the ore, the simple weight.

16,205. Do the men work double or single handed in your mines?—Two of them work together, one will hold the jumper and the other will strike; we have always two men working together, very few of the men work single-handed.

16,206. What is the youngest age at which you allow a boy to go to work underground?—Eighteen is the youngest age.

16,207. May not a father take his son down into the mine with him before that?—No, we do not allow that; and at present in Teesdale here particularly, many of the boys are kept out until they are 20 or 21, but that is contrary to our wish; we should conceive it desirable that a boy should go underground at 18 in order to obtain skill when his mind and body are in a proper state for learning.

16,208. Are the men who work underground sooner or more affected by the work than those who work at the surface?—I conceive, as a general rule, that they are, because it is more unhealthy.

16,209. Are you of opinion that going into the mines young is likely to increase the evil?—Yes, decidedly.

16,210. Will you be kind enough to state what education is provided for the children of the miners?—Our rule is that every child belonging to our workmen shall go to school between six and 12 years of age.

16,211. Do all the men contribute to the maintenance of the school by weekly or monthly payments, or those only whose children attend the school?—Each parent pays for his own children and for no others. The rule is that the girls shall go to school until they are 14, provided they remain under the parental roof; if the parent sends his child out to service, we do not stand in the way of that. At 12 years of age the boys are eligible to come to our ore-dressing floors; but in order to do that they must have a good school character. Then, from the age of 12 to 18, as a rule, they must attend the ore-dressing floors, and at 18 years of age they are allowed to be placed underground. At 14 years of age we allow them to go underground during the three winter months when the ore dressing is not in operation. Owing to the severity of our climate here, we cannot dress the ore throughout the whole of the winter, and we must take it that on the average, for two or three months in the winter, each boy, after becoming 14 years of age, is underground; he is placed with one of the mining partnerships as a labourer, and in that way he is serving a sort of apprenticeship, or obtaining knowledge that is likely to be useful to him in after-life. At 18 years of age we consider these young men eligible to be placed as partners in the mines, and to become members of a partnership. We do not allow them full wages, but we put them in at so much in the shilling, varying from 9*d.* to 11*d.*, and in that way the experienced men, with whom they are working, are getting some compensation for their tuition; but in practice I may say that the bulk of our boys have been kept out until they become 20. In recent years, owing to the fact that we have had a greater amount of ore to dress than we had boys under 18 to dress it, they were kept out longer, so that the bulk of our boys now may be said to be kept out of permanent underground working until they are 20 years of age, and even beyond that.

16,212. How are the schools supported?—They are supported exclusively by the Company, that is, their own two schools; but every workman pays 1*s.* a quarter for each of his children that he may have taught there—4*s.* a year.

16,213. But, as I understand you, single men and those who have no children do not pay anything?—No, except they have brothers and sisters, and there is not a father.

16,214. You say that the children are compelled to attend school; what kind of pressure is brought to bear upon a parent?—I should remonstrate with a parent against the impropriety of not sending his children to school, and giving them education; and if I found any children absent, and he did not pay attention to my remonstrance, I should inflict a pecuniary fine upon him. If he still remained obstinate I should not hesitate to dismiss him from the service as an unworthy operative.

16,215. Have you ever had occasion to take such a step as that?—No, I have had occasion to fine occasionally, but not to any large amount; say 2*s.* 6*d.*

16,216. Was any objection made to the infliction of that fine?—No; I may add also, that the boys are not placed underground unless they have a good school character.

16,217. On what is that good school character based?—Every boy must pass a scriptural examination, and, upon his passing a satisfactory Bible examination, he is presented with a Bible by the Company, and he is then considered eligible for the works.

16,218. On what principles is the school conducted, in conformity with those of the Church of England, or of dissenters?—On neither, it is conducted on a general and liberal principle. Our rule is this, we have the Bible, and we have such catechisms in the school as contain all the fundamental doctrines of Christianity, without any denominational or sectarian bias; we use the catechism of Gall, of Edinburgh, and Lloyd's Bible catechism, and Watts' catechism,

and the yearly issue of Bible lessons by the Sunday School Union's ; those are the chief.

16,219. Has there never been any objection made by the miners to send their children to school on account of religious bias ?—None whatever.

16,220. Do you find that the men working in the mines are to a certain degree well educated ?—Yes, I consider that they are.

16,221. Do you conceive that that has had a good effect upon the general conduct of the men ?—I am of opinion that it has decidedly had that effect.

16,222. Have there been any strikes among them ?—No, we know nothing of that ; there has not been one since I have been in the concern, and I have been here above 20 years ; there were none in the time of my predecessor, except during the two or three first years of his superintendence.

16,223. Do you think that the men, on account of the education they have received when young, take care not to injure their health by overwork, or working in bad places ?—Yes, I conceive that they are generally intelligent on the subject, and that they are alive to the maintenance of their health.

16,224. In the course of the workings I presume you come upon places where the air is not good, and where the candle will not burn properly ?—We may have come upon such a place ; but we hold it to be our duty to ventilate such a place.

16,225. Do the men ever complain of it, or is it brought under your notice by the men or by the agents?—It would be brought under my notice by the agents. My general instruction to the agents is this, to have all the mines thoroughly well ventilated, and in right working condition. I give them authority to take all the measures they consider necessary or desirable for effecting that object, so that the overman has in his own power at once the remedy for any evil that may arise.

16,226. What are the remedies to which they generally resort to supply, for example, any deficiency of fresh air ?—They force in fresh air, pure atmospheric air, into the fore ends, where the men are working.

16,227. What means are adopted for forcing in the air ?—I mean forcing in the air where we are driving a level, by a water blast or a fan blast.

16,228. Is the fan blast worked by water or by hand ?—Sometimes it is worked by men, and sometimes by water power. If we are driving a long level, our object is to get a water blast down a shaft, or from the inclination of the hill, which we are generally able to do from the springs, bringing them down in close pipes, and so get 15 or 20 fathoms of pressure, as we find it convenient, and then the escape of that water through an opening in the bottom, into a pipe at the end, forces the air forward a great distance.

16,229. Are the pipes by which the air is carried on, made of wood or of iron ?—They are made of iron generally, that is, cast iron ; we may use wooden pipes for a small local purpose, or a temporary one.

16,230. Do you ever use zinc pipes ?—No, we have not ; the pipe is five inches internally.

16,231. Is that the general size of the pipes ?—Yes, the universal size.

16,232. When you are putting in a rise, are the pipes then carried up ?—Yes, they are carried up the rise.

16,233. What means are taken to prevent it from filling up, when the pipe is taken up a rise ?—They will so place it as that the stuff will not come into it, or a perforated hose is used.

16,234. That is always carefully looked to by the agents, is it ?—Yes, otherwise it would neutralize all our other efforts.

16,235. To your knowledge are there any men working in your mines who have suffered, or are suffering in their breathing ?—Yes.

16,236. At how young an age should you say that that first shows itself ?—It will depend partly on the constitution of the individual and partly upon the particular places in which he may have been working for some time.

16,237. By places in which he may have working, do you mean that he may have been working in a place before a communication has been effected ?—Yes, or where there has been a large amount of dust.

16,238. Do you think that the dust is injurious to the miners ?—My own impression is that it is the dust and the gunpowder smoke, and the absence of day light, that affect the miner's health.

16,239. More than any want of air ?—Yes.

16,240. Do you adopt any means when a mine is very dry and dusty to get rid of the dust ?—No, I do not know that we can, it arises you see from a moving operation that we really cannot control.

16,241. You mean, I presume, from boring ?—Yes.

16,242. Is there a doctor attached to the mines ?—Yes, the Company find a doctor in each of the districts.

16,243. How is he paid ?—He is paid by the Company exclusively, without any charge being made upon the men.

16,244. Do the men belong to any sick club ?—We have a sick club connected with the concern.

16,245. What do the miners contribute to it ?—Every man pays 30*s.* a year.

16 246. Is a separate account kept of that fund ?—Yes.

16,247. Are the contributions made by the miners sufficient to meet the demands upon the fund ?—They have not been so in times past, but they are at present.

16,248. Is relief afforded only in case of visible accidents, and not for sickness ?—Yes ; in both cases.

16,249. What is the amount of the allowance made to each man ?—7*s.* a week for sickness, and now 6*s.* a week pension after attaining 65 years of age.

16,250. Does that come out of the same fund ?—Yes.

16,251. Is that pension often claimed ?—Yes, we have several parties on the list.

16,252. Have you any notion how many of such pensioners there are now ?—Yes, the paper which I hold in my hand will show you, from the year 1851 to 1861, the number of members, the number of pensioners, and the deaths, in those respective years.

The following paper was handed in :

Governor and Company's Workmen's Fund.

In the year.	No. of Members.	No of Pensioners.	Deaths of Members.
1851	943	16	21
1852	934	15	11
1853	871	13	16
1854	940	14	19
1855	921	16	12
1856	946	16	9
1857	943	16	9
1858	965	16	14
1859	979	17	14
1860	1,020	18	17
1861	1,038	16	21

16,253. (*Mr. Kendall.*) The moment a miner becomes 65 years of age has he a right to claim a pension ?—Yes, whether he be in health or in sickness.

16,254. (*Mr. Austin Bruce.*) And whether he continues to work or not ?—Yes, it is totally irrespective of all considerations.

16,255. (*Chairman.*) Is there any consideration as to the number of years he has already worked in the mines ?—None whatever. On attaining the age of 65 his personal contribution to the fund ceases, and he is entitled to that pension without any further contribution.

16,256. You say that at present the receipts from the miners are sufficient to meet all demands upon the fund ?—When it was first established it was established on a too liberal basis ; that is to say, the payments out were too large for the fund. In the course of a few years it became insolvent, and it was then submitted to an actuary, who reported the fund to

MIDDLETON.

R. W. Bainbridge, Esq.

10 Oct. 1862.

be insolvent, and at that time the Lead Company agreed to contribute 200*l.* a year. I think that the men were called upon each to pay an additional 6*s.* per year towards the redemption of the fund, and the Company agreed to pay an amount equivalent to the whole amount of the men's contribution of 6*s.* also, over and above the 200*l.*, and that went on until the fund got into a state when it was reported to be solvent. Upon its becoming solvent, then the men's additional contribution of 6*s.* per year ceased, and the Company's contribution equivalent to that 6*s.* a year also ceased; their payment of 200*l.* a year was reduced to 100*l.* a year, and that 100*l.* a year was given because the actuary, to whom the fund was then submitted, stated that the then proposed increase of the pension from 4*s.* to 5*s.* a week, and the proposed increased allowance from 6*s.* to 7*s.* per week when the men were sick, would not be met by the fund—that there would be a deficiency of 100*l.* a year. The Company at once said, in order to enable these increased allowances to be made to the members, "We will give 100*l.* a year for the next seven years, "until the fund is again reported upon." The fund has since that time undergone another septennial revision down to October 1860, and it was then submitted to Mr. Ansell, the eminent actuary of London, and he reported that the fund was not only solvent, but that there was a surplus of above 3,000*l.*, which was available either for a diminution of the contributions to the fund or for increased benefits. It was then a question whether the contributions to the fund were to be diminished, or whether an increased allowance was to be given to the sick members and pensioners, and it was decided that it was not desirable to diminish the amount of the yearly contributions into the fund, but it was more desirable to increase the benefits to the members.

16,257. By whom was that question decided?—It was decided by a general committee, in whose management it is, two-thirds of whom are selected by the men themselves, the other third is represented by the Company's several district agents in their official capacity. Then it was agreed that the sick allowance should stand as it was, 7*s.* a week, but that the pensions at the age of 65 should be increased from 5*s.* to 6*s.*, and the actuary conceived that the fund would just about meet that for the next seven years. It was also thought desirable by the committee that a payment of 2*l.* should be made towards the funeral expenses of a wife of a member. The actuary did not conceive that the state of the fund would admit of that, and the Company said, "We will continue our contri- "bution of 100*l.* a year, expressly with the view of "meeting that charge." So that now the Company are still continuing their contribution of 100*l.* a year to the fund for the current seven years, with the view of covering that payment of the funeral expenses of a wife.

16,258. Supposing the husband dies, what is done in that case?—In that case 2*l.* are allowed for his funeral expenses, and 3*l.* are paid to the widow.

16,259. Are the contributions which you have just mentioned confined to the men who work underground?—No; they apply to all the workmen in the Company's service.

16,260. Do all of them pay alike?—Yes.

16,261. They pay alike, whatever the amount of their wages may be?—Yes, and receive alike. I may mention that the number of members belonging to the Company's workmen's fund in 1850 was 921, while in 1861 it was 1,038. The number of pensioners in the year ending 1st November 1850, was 22, while in 1861 it was only 16.

16,262. Are the pensioners confined to men of 65 years of age and upwards?—Yes; there are none under 65. It has been agitated amongst us whether the age should be reduced; but the actuary stated that he did not conceive the state of the fund would allow of it.

16,263. (*Mr. Austin Bruce.*) If a man becomes disabled before he attains the age of 65 by any accident, he is relieved, I suppose, as a sick man, and not as a pensioner?—Yes.

16,264. (*Chairman.*) If he is permanently injured, would he become a pensioner?—No; the Company are the treasurers of the fund.

16,265. (*Mr. Austin Bruce.*) Do the men contribute to any other club besides that which is connected with the works?—Yes, they do; they are at liberty to do so. We object to their becoming members of the Odd Fellows, or of those clubs that travel all over the kingdom.

16,266. Why so?—We do not like it, our men, generally speaking, are local men, and we do not like them to be connected with those clubs that extend all over the kingdom; they generally contribute to clubs in their own neighbourhood.

16,267. Are the poor rates light in this district?—They are comparatively light; there is no doubt that this sick fund is a most material relief to the poor rates.

16,268. (*Chairman.*) What deductions are made from the miners?—For candles, gunpowder, and tools.

16,269. Are the tools weighed?—Yes, they are weighed to the men; we charge them so much per pound for the tools, and we charge them for the drawing of the work out of the levels, that is paid by the men as part of the bargain, and deducted out of their earnings.

16,270. Then the responsibility of removing all the material rests with the Company?—Yes.

16,271. And not with the men?—No, it rests with the local inspectors, in whose charge the drawing may be said to be.

16,272. What do the miners pay per pound for candles?—That varies according to the price; we charged them last year about 7½*d.*

16,273. Are they charged anything beyond the contract price?—Yes, something to cover the agent's trouble, and everything of that kind.

16,274. Is it the same with regard to the gunpowder?—Yes, and I may say that they pay that with this view: the men, if they had these things too cheap, would be wasteful, and it is not desirable that we should be below the country price.

16,275. They do not pay anything beyond the country price?—No, I do not conceive that they do in general; I believe that we are below the retail price of the country.

16,276. Are the miners limited to a certain quantity?—No; I hold it to be the duty of the overlooker to see that there is no waste; and I always cause to be hung up in the office a list of the quantity of powder and candles that each partnership has been supplied with during the preceding quarter. That is ostensibly in order that the men may have information of how our accounts stand; but really as well that the men may be mutual checks upon each other, as to the use and the waste of candles, and it does operate in that way.

16,277. As they pay for them, it is for their own advantage that they should not consume more than is necessary?—Of course; we intend that our men should earn a net sum after the deductions for these things are made, and if they are wasteful, then the charge comes upon the Company as it were.

16,278. (*Mr. Austin Bruce.*) Will you be good enough to state how many men were in your employment in 1851, and what the number of men receiving pensions was, and the same with respect to 1861?—There were 16 men receiving pensions in 1851 out of 943 workmen, and in 1861 there were 16 men receiving pensions out of 1,038.

16,279. In you opinion, does the difference of proportion arise from any but accidental causes?—I cannot give you any reason.

16,280. Have you ever taken the pains of comparing the length of life of your workmen with that of those who are not engaged in mining operations?—No, I cannot say that we have.

16,281. At what age do they usually begin to show

that they are affected by their lives as miners?—Perhaps about 40.

16,282. Is their health then usually so affected in your opinion, as to diminish the produce of their labour?—No, I do not think that it is. By that time, generally speaking, the younger members of the same family connexion will work with the older, and there is the skill of the one and the physical energy of the other, the one compensates for the other, and there is a good deal of that among the miners. Supposing the members of the family of an old man see that he is rather failing, they will work along with him and take the laborious part of the work off him.

16,283. Have you spent all your life in these districts?—I am a native of Alston Moor.

16,284. How early did you become connected with these districts, by occupation?—At about two or three and twenty years of age.

16,285. Since that time have you observed any change in the physical condition of the workmen?—My impression is, that upon the whole, it has been improving; mainly from this fact, that during the preceding 20 years, the mines underwent a general improved ventilation, then by the time that I came here, those who had suffered previously to the previous 20 years from a comparative defect of ventilation were dying out.

16,286. In the last 20 years have there been also improvements introduced in ventilation?—No; I really cannot say so. My impression is that my predecessor paid equal attention to that as I have done myself.

16,287. Have there been any improved modes of introducing fresh air or extracting the foul air within your recollection?—No; we still have recourse to the water blast and the fan blast, which were in operation above 20 years ago.

16,288. Do you ever use the furnace as a means of improving the ventilation?—Never.

16,289. You conceive that it is not necessary?—It is not necessary in our case.

16,290. Have you many shafts over your workings in Teesdale?—Yes, a great many.

16,291. Does the upcast air generally ascend through them, or pass out at the levels, or both?—It depends upon the state of the atmosphere; sometimes the current will be one way and sometimes the other.

16,292. Have you any fixed upcast and downcast shafts?—No.

16,293. You do not attempt to conduct the air in regular courses?—No; we have not the need of that. The only thing in that respect is this: supposing that we have a level going, and that we have an opening drift above, then the air will pass along the level up the furthest working and back with the drift; that may be said to be comparatively the same as in the coal fields.

16,294. It is conducted in that case?—Yes; and any intermediate opening would in that case be closed.

16,295. You would have doors put up?—Yes.

16,296. Do you observe any difference between the relative health of the miners in the different districts under your charge?—I should say, that upon the whole Westmoreland is our healthiest district.

16,297. Where in Westmoreland are your mines?—At Dufton and Hilton and Merton.

16,298. Do you attribute the slightly superior health of the workmen there to any particular cause?—One cause may be this: the men are living in a farming country, and can get an abundant supply of milk and oatmeal, and everything of that kind. Another cause may be this: that when they are not working underground they may be able to obtain agricultural employment, which is beneficial to them.

16,299. Do they do so occasionally?—Yes, most of our miners, when they have completed the 40 hours which we require of them, will obtain any above-ground employment that they have the opportunity of getting.

16,300. You stated that in your opinion dust was the chief cause of the miners' disease?—And the gunpowder smoke. I should say also, that if there was bad ventilation there would be a great injury, but then we endeavour that there shall be no bad ventilation.

16,301. The ventilation in all your mines, I presume, is pretty good?—I consider it good as a whole.

16,302. And equally good?—When there is a larger number of men in a given locality, of course the air will not be so good as with a smaller number.

16,303. But as between the different districts, is there any difference?—Westmoreland may be said to be the best ventilated, naturally, owing to the rocks there being of a more broken character, and the fissures themselves yielding air independent of artificial ventilation.

16,304. (*Chairman.*) What is the rock?—There is a great deal of limestone there.

16,305. (*Mr. Austin Bruce.*) Does one sort of rock throw off more dust than another?—There would be more dust in the sandstone and shale than in the limestone.

16,306. Do the men therefore suffer appreciably from working in one sort of rock?—I cannot say that I can speak to the fact of any difference, I do not go so closely underground myself as to enable me to speak particularly upon the point; you will get that better from the more practical agents; I may refer you to them in that respect.

16,307. Have you a night school for boys between 12 and 18?—No; several of them do attend a night school, but that we do not recognize, excepting that whenever they do attend a night school we are ready to pay. With regard to education, I may state this: the Company have a school of their own at Middleton, applicable to the Teesdale district, and a school at Nenthead, also applicable to that locality, but the men are scattered, many of them are at too great a distance to be able to send their children to those schools, and in those cases we contribute 3*s.* per quarter for each child at any school to which the parent may choose to send his child; and in some instances contribute also a yearly sum in aid of the stipend.

16,308. Any school not connected with you?—Not directly connected with us; in that case we still charge the man 1*s.* per quarter, so that the Company virtually contribute 2*s.* and the man 1*s.* I had better give you our school regulations (*delivering in the same*).

16,309. (*Mr. Davey.*) Have you any accommodation at the surface for the men to change?—Yes.

16,310. Have you lodging houses also?—Yes.

16,311. How many do you get in those houses generally?—That depends upon the number of men employed at the mine, and how many of these men are able to go to and from their work to their own homes.

16,312. What accommodation have you for the men who come there, have they separate beds?—There are beds which will contain two men each, two men are allowed to sleep together.

16,313. In shifting the pairs do they come into the same bed afterwards, or are there two in each bed for the whole of the time?—In general I apprehend that two men appropriate a bed and stick to that bed, they do not like sleeping indiscriminately in each others beds.

16,314. Does it happen that two men are in the bed at the same time?—Yes.

16,315. How many beds have you in one room?—That varies very materially; the beds are six feet four inches in length, and four feet four inches in breadth, if I mistake not; we generally fill a room with beds, and we have two tiers in general, but I may say that practically the upper tier is seldom used; the lower beds are generally those which are used, the upper tier is only put into requisition when there is a greater number of men than are sufficient to occupy the lower.

16,316. What is the ventilation of the room?—We have an opening under the eaves for the admission of fresh air; we also have an opening at the ridge.

MIDDLETON.

R. W. Bainbridge, Esq.

10 Oct. 1862.

This is a specimen of our ventilating apparatus (*producing the same*).

16,317. (*Mr. Holland.*) Is that the size of it?—No.

16,318. (*Mr. Davey.*) Who settles the ventilation, is it done by the men themselves?—The agents do that.

16,319. (*Mr. Holland.*) What size do you use for your ventilating apparatus?—Those that we use ourselves are perhaps a foot in diameter, one tube within another, so that there is an inlet and an outlet draft, that is the principle of it.

16,320. (*Mr. Davey.*) What distance have the men generally to come to these lodging houses?—Many of them have to travel six or eight miles to the mine where they are at work; the lodging houses are always at the level mouth. With regard to the ventilation, I may state further that we carry up a tube parallel with the chimney flue. The object of that is to carry off the impure and heated air. When the fire is on, the heat in the chimney flue extends to this tube and rarefies the air in it, so that it will either carry the vitiated air off or bring fresh air in, and whichever it does it is beneficial; that is one means of ventilation which we have; we make use of that also in our cottages here; the Company have built a number of cottages for the use of the miners upon the spot, and we make an opening under the ceiling, and carry up a tube, say of three or four inches in diameter, parallel with the chimney but quite distinct from the chimney, still the air in that parallel tube is affected by the heat in the chimney, and it will create either an internal or an external draft; it will either admit pure atmospheric air down the tube, or it will carry off the vitiated air of the room into the open air at the ridge.

16,321. (*Mr. Holland.*) What gives the motion down the tube?—The natural pressure of the atmosphere; the air in a room is rarefied, and is of less weight than the cold atmosphere.

16,322. (*Mr. Davey.*) Have your men who live in the lodging houses any holdings of fields?—Yes, a great many of them have little farms.

16,323. Do you find any difference in the men who hold these small farms and those who live in the Company's houses?—Not in point of general health; because the fact is this, those men who live in our houses are found by us with gardens.

16,324. Does it improve their condition as miners?—I conceive that it does. The holding of a small farm will improve the family condition of a miner; it is calculated to improve both his health and his circumstances. But in order to compensate such of our men as have not farms we endeavour to provide them with gardens.

16,325. What proportion of your men live in lodging houses?—In Teesdale, I should say fully two-thirds, or more than that; we have a much larger proportion in Teesdale than in any of the other districts, owing to the fact that the mines are, generally speaking, at a distance from the town.

16,326. (*Mr. St. Aubyn.*) You have said that during the three months of hard weather in winter the boys of 14 work underground?—Yes.

16,327. Do all the boys who are employed by you go underground, or do a part of them go underground and the remainder remain above?—At 14 years of age we place the whole of them, of good character, underground, till we have occasion for their services at the ore dressing in the early spring.

16,328. Does it ever happen that part of those boys remain working underground at the expiration of the hard weather?—No.

16,329. They all come to the surface?—They all come to the surface again. Here is a list of the rules in the library, to which all our men have free access without any payment whatever (*producing the same*).

16,330. (*Mr. Kendall.*) Have you periodicals?—The Company built a reading room in the town here, for which they charge no rent, and the Company find fuel and light and cleaning, leaving the men themselves to provide the periodicals and works; and such of the men as are members (it is optional with them) pay 6*d.* on entry, and 3*d.* per month contribution. With regard to the mine shops, these are the printed rules, which we hang up in each mine shop for the regulation of the mine shop (*producing the same*).

16,331. You have a system as to your children and as to your miners; we have heard nothing at all as to the inspectors. Have you a system as regards inspectors of mines?—Yes.

16,332. What is the rule as regards inspectors; are the agents taken from the miners?—Yes; in the first place being raised to the rank of an overseer or inspector.

16,333. What is the test for an inspector?—Generally speaking I apply to all the local agents to give me a list from time to time (say once in three or four years) of all the young men in the concern whom they conceive likely to make good inspectors. When I have obtained that list from them I keep my eye upon each of these parties individually, and form my own opinion of their character; and our test, of course, is intelligence, integrity, and independence of character. I should say that those are the three grounds upon which we make our selection.

16,334. When your pensioners arrive at 65 they are entitled to 6*s.* a week; may they quit the district then?—Yes, and do what they like; they are thoroughly their own masters in every respect.

16,335. Then they may go elsewhere and work and do what they like?—Yes.

16,336. And still draw from you their pension?—Yes.

16,337. (*Mr. Austin Bruce.*) Many of your men live in houses belonging to the Company?—Yes.

16,338. Have you any objection to state what is the rent which they pay for those houses?—£3 10*s.* and 4*l.* a year.

16,339. How many rooms are there in the houses?—Four rooms; we charge 4*l.* 10*s.* a year for four rooms and a garden.

16,340. Of those rooms how many are sleeping rooms?—Two of them; and then they generally make use of the kitchen also as a sleeping room.

16,341. So as to make a division of the sexes of the children?—Yes; the father and mother generally sleep in the lower room, and the girls upstairs in one room, and the boys in another.

16,342. Do many of the cottages belong to the workmen themselves?—Yes, many of them.

16,343. Is that a common way of investing their savings?—Yes.

16,344. (*Mr. Holland.*) Do they take lodgers?—Our rule with regard to the Company's houses is, that they shall not take lodgers; but I suppose that we find it needful to be blind occasionally.

16,345. Then that rule is relaxed?—Yes.

16,346. What relaxation do you allow?—I cannot say that we have any general rule. Supposing that there was a surplus of population over the house accommodation, then instead of going to the party and saying, "You ought not to have lodgers," I should think it advisable to look over it.

16,347. Is there often a surplus of population over the house accommodation?—Occasionally there is, but only occasionally.

16,348. Then the overcrowding as regards lodgers is an exception, is it?—It is an exception to the general rule.

16,349. (*Mr. Kendall.*) The balance beyond the 11*s.* a week is paid up at the end of every year?—Yes.

16,350. Do you think that the sums of money which the men receive then lead them to invest in small farms, and buying stock for farms?—Yes.

16,351. Then you think that their receiving a balance at the end of the year is more beneficial than their receiving so much more money a week?—Yes, I do. It comes to meet those annually accruing charges which they cannot escape, and our retaining

the money in our own hands I believe is better than if they had it in their pockets, in many cases.

16,352. You find that very frequently those balances are invested in cows and so on?—Yes, and in the building of cottages. I think you ought to know that at our mine shops we always provide a cool pantry for the keeping of the men's provisions, and we always provide a flow of water where they can insert their cans or bottles of milk so as to keep them fresh for several days, and in each of those mine shops there is a flow of water so that they can wash themselves.

16,353. How long has the Lead Company been working?—Nearly 200 years.

16,354. (*Mr. Holland.*) Are the cottages let at a fair paying rent, or is an advantage given to the miners?—I consider that the miners have an advantage in the cottages; that they do not pay the Lead Company pecuniarily, but the cottages are provided for the accommodation of their best class of workmen.

16,355. The difference between the real rent and the rent paid is in fact an addition to the men's wages?—It is an indirect addition, there is no doubt.

The witness withdrew.

Mr. WILLIAM EWART examined.

16,356. (*Chairman.*) Are you the surgeon employed by the Lead Company?—I am.

16,357. Have you any other general practice, or are you almost solely employed by the Company?—I am almost solely employed by the Company; there is a little practice besides, but so trifling that I am almost solely employed by the Company.

16,358. How long have you been surgeon of this district?—15 years.

16,359. Have you had the superintendence of the mines in this district for 15 years?—I have.

16,360. Do you observe as regards the health of the miners that there is any peculiar disease to which they are subject?—Decidedly; there is one variety of disease; that is, disease of the lungs, commonly called bronchitis; the disease called bronchitis is not peculiar to miners, but there is a variety of bronchitis, both acute and chronic, peculiarly belonging to lead miners.

16,361. (*Mr. Holland.*) You mean to say that miners are liable to a peculiar form of bronchitis?—Precisely so. I am not acquainted with other mines. This disease is not produced by the lead.

16,362. (*Chairman.*) By what is it produced, in your opinion?—In my opinion this bronchitis is caused by a variety of influences; these, as far as I am able to judge, are, the air being rendered impure by physical particles from the stratifications, these being limestone, sandstone, and so on, the irritating gases produced by the explosion of the gunpowder, which is so extensively used in blasting these stratifications, by the men's own respiration polluting the air with carbonic acid, and by the combustion of candles.

16,363. And by the dust?—Yes, the dust being of a mechanically irritating character. I think so on this account, immense quantities of this matter is spat by these miners at all times while they are working; not only so, but there is evidently a deposit of powder in the air passages and cells of the lungs remaining for years after the men have ceased to work in the mines. I have cases every now and then occurring of men who have left the mines I should say nine years, who have not been working in mines but working in the open air; they have kept in tolerable health; they may perhaps have had a slight attack of acute bronchitis now and then; by the appropriate remedies we subdue that, and they get into working order again, they are perhaps not in very good health, however; they are perhaps at last seized with a very severe attack of acute bronchitis; they then begin to spit enormous quantities of blue and dark matter, and they perhaps continue to spit this for months before they are cut off, that evidently having been in the lung for years. Of course I have not had this matter analysed, but to the eye it is plainly like powder floating in thick mucus and pus, what surgeons call muco-purulent matter.

16,364. But you have never looked at it with a microscope?—I have not. I sent some to London some two years ago, and I never heard the result. I submitted some as far as I recollect to Dr. Greenhow and I never heard what was made of it.

16,365. Have you in that case ever seen a person recover when he has got rid of that matter?—Very seldom. I always consider that when they begin to spit this blue matter in any quantity, particularly when that is combined with general irritation of the system, it is the beginning of the end.

16,366. At what age have you ever observed that miners are attacked with the first symptons of this disease?—They are attacked at all ages. The first thing generally by which a miner is attacked is acute bronchitis, which is simply inflammation of the lining membrane of the air passages, more or less.

16,367. At what age have you observed it?—From the age of his entering into the mine at 20 or 21, during the whole time, they are almost all liable to these attacks; almost the whole of them have an attack either slight or severe, I should say, before 35. I give a good margin there. I had a case the other day of a man about 25 or 26. These attacks are generally easily subdued, they are acute, and the men go to work again. They commence under the same circumstances.

16,368. (*Mr. Holland.*) Do you mean that the attacks are acute and short?—It is according to the severity; they are sometimes not long, perhaps I may say, that generally the men have come under treatment for a fortnight or three weeks.

16,369. (*Chairman.*) When that happens to men so young, they can go back to work?—Yes, they get quite well again.

16,370. They are not affected at all in their breathing?—They are generally slightly asthmatic. I use the word asthma simply as having the meaning of shortness of breathing. Almost all our miners, be they young or be they old, from the first attack of bronchitis, from their having wrought in the mines a year or two, are slightly broken-winded,—slightly affected in their breathing. A man supposing himself to be thoroughly healthy, when I am walking with him beginning to ascend a bank, begins to show difficulty of breathing, he breathes fast and quick.

16,371. When they have come under your care, have you ever thought it right to recommend that they should not go below again?—Yes, I sometimes do that, but it is a difficult thing to enable them to remain outside; there is no work for such a number of men; but in some cases I decidedly recommend that they should not go underground again if possible.

16,372. Do you think that the effect of their going underground is likely to confirm the disease?—Assuredly, where the disease is in a chronic condition. What I mean by "chronic," is certain effects which we suppose to be perhaps a little thickening of the lining of the air tubes, partially closing the passage; there is a little of that left, which produces the asthmatic breathing. A man continues to work in that condition for years perhaps, but then again he is seized with an acute attack, which injures his health, and renders this chronic condition of disease still more decided, and still more extensive, and still more severe.

16,373. Could you name men who are affected in their breathing, and are still working in the mines?—Decidedly so; I could find out several; I have no doubt of it.

16,374. Did you ever have a post mortem examina-

MIDDLETON.
Mr. W. Ewart.
10 Oct. 1862.

tion ?—Never. Post mortem examinations in these countries are difficult to be had.

16,375. Do you ever go down into the mine yourself ?—No. I have been in a mine ; I have gone into a mine just to see the mine.

16,376. Have the men ever stated to you that they have been affected by working in any particular level ?—I am sure that they have ; I am sure that men have stated to me that they have been injured by working in such a fore-head, but I cannot call to mind the particular place.

16,377. What is the man's opinion of the cause of his disease generally ?—I should think that generally speaking the men's opinion is very much what I have stated, that it is owing to impure air, not, perhaps, that they are capable of stating the scientific causes of that impurity ; but, as far as I know, I believe that their opinion is generally that their complaints are caused by impurity of air.

16,378. (*Mr. Kendall.*) Having given a great deal of attention to this matter, has it ever struck you that there is any mode of working which might remedy the defect there ?—As far as I have been able to judge, the modes of prevention resolve themselves into the proper ventilation of the mines, and of course into a proper attention on the part of the miner to his general health ; and there is one thing that the miners do which I have sometimes thought they ought not to do, they work in flannel shirts, which have sleeves, and of course one half of the miners are always employed in striking a borer; these sleeves are continually full of dust, and they must breathe an air much fuller of dust than if they were robed without this flannel shirt altogether. Then another thing is this : the atmosphere of a mine is generally much warmer than the external air, they perspire, this flannel shirt gets saturated with moisture, they come into the cold air and frequently there is a chill, at all events a chill is likely to be produced in that way. Now I would suggest that the miner should, if possible, work bare to the waist, and that he should have his flannel shirt kept thoroughly dry and comfortable, which he could put on when he came towards the external air.

16,379. You have no reason to suppose that there is any lack of ventilation ?—No ; as far as I know, I believe that every attention is paid to the ventilation of the mines.

16,380. (*Mr. Holland.*) Did you not just now recommend improved ventilation ?—Yes, improved in this way, if possible : supposing that a level is being driven into a hill where there is no shaft, and no possibility of a current of air passing into the level and out at another outlet. I dare say it must be, to engineers, very difficult indeed to produce a proper change of air at what is called the fore-head ; I suppose that they have various contrivances to carry up pure air by means of machinery. My department being so thoroughly outside, I am not called to go down the mines.

16,381. You spoke of miners being very liable to acute bronchitis at all ages ; is that in young miners produced by catching cold or by dust ?—I look upon the dust in the young miner as the predisposing cause, and generally speaking the exciting cause of the attack is exposure to cold.

16,382. By catching cold ?—Yes.

16,383. They generally recover from those early attacks of acute bronchitis pretty well ?—Yes, time after time, generally speaking.

16,384. After a time the attack becomes less acute? —Yes, it seems that there is a progress.

16,385. Is there thickening of the mucous membrane ?—Yes ; that is an inference, because without a post mortem examination I would not speak positively; but from the expectoration and from the physical signs, from the sounds listened to by the stethoscope there is a pretty fair and sure inference that there is a thickening of the lining membrane of the air tubes.

16,386. What sounds do you hear by the stethoscope ?—Sibilant,—mucous, sonorous, and hissing.

16,387. A whistling sound ?—Yes.

16,388. Is that whistling sound frequent ?—Not very frequent ; the most common sound that I have listened to is a sound something like a snoring sound.

16,389. I think you have said that almost all miners are slightly broken-winded after their first attack of acute bronchitis ? — Yes, more or less, but it is sometimes so very slight as scarcely to be noticed.

16,390. But still it is noticed ?—Yes, they all confess that they are affected more or less with shortness of breathing.

16,391. You have stated that they spit up discoloured sputa a long time after leaving the mine ? —Yes.

16,392. Do you believe that that discoloured sputum has been in their lungs all that time ?—I can account for it in no other way but by believing that it has been, because it is of the same colour, and the same sort of matter as they spit generally on leaving a mine. A miner almost always on coming out of a mine, from a little irritation of the throat, heaves up a few mouthfuls of this coloured expectoration.

16,393. What colour is it generally ?—A sort of greyish blue.

16,394. Where do you suppose that that matter has been lodging all that time ?—I think that it must have been lodging in the lining of the air passages, and probably in the air cells.

16,395. What quantity would there be to last for 20 years ?—I cannot say.

16,396. A pound or two ?—No, I should think not so much as that, it is exceedingly light.

16,397. I understood you to say that they continued to spit this discoloured matter ?—While working in the mine they are always spitting a little of this discoloured matter ; but I am speaking of a man who has not been in a mine for ten years, he is then seized with an acute attack of bronchitis, which gradually verges into a chronic condition, and he goes on spitting this coloured matter until death.

16,398. With pus ?—Yes; it is sometimes decidedly purulent, of the nature of pus and coloured again, and he continues to spit this coloured stuff during this last attack until death.

16,399. Does he go on spitting it day by day for years ?—He may do so for several years, more or less. I have had a case of this sort ; a man, judging from my recollection, perhaps about 50 years of age, who had not worked in a mine for eight or ten years, he is seized with acute bronchitis, he begins to spit and he spits a considerable quantity of this bluish matter. By treatment, he is relieved of this attack, and he again ceases to spit this for a time, longer or shorter, according to circumstances ; he is seized again, perhaps, a year after this. These attacks very often come on in spring. In the commencement of the winter, he is again seized with an acute attack, and he spits the same matter for a short time again ; he is relieved again, but he is not a healthy man ; he is laid off again, he goes wandering about, and perhaps doing a little light work about a little farm which he may have, and at last he is seized again with acute bronchitis, and this proves intractable and severe, and it just gradually verges into a chronic state with irritative constitutional fever.

16,400. (*Mr. Austin Bruce.*) In the case which you have mentioned, where you have supposed that a man has left work for eight or nine years when the attack has come on, what has he been doing during those eight or nine years ; has he been, in your view of the case, expectorating all the time ?—Yes, more or less.

16,401. And expectorating matter discoloured by the substances which he has inhaled during the time that he has been working ?—Yes, more or less.

16,402. Do you think that he could during that time have laid in a stock of discoloured matter sufficient to supply the expectorations of many years ?—When I speak of his expectorating during the intervals of these acute attacks, I mean to say, that perhaps a single sputum in the day may be slightly coloured ; he does not spit that coloured stuff when

he is walking about in the intervals between the acute attacks, so that my belief is decidedly that this blue expectoration is the result of the inhalations in the mines.

16,403. (*Mr. Holland.*) But I understood you to say that that supposed mechanical irritant was only after long intervals, and for a few days at a time, in any quantity ?—Yes.

16,404. And that at other times it was exceedingly small ?—Yes, during the intervals of the acute attacks.

16,405. (*Mr. Austin Bruce.*) At what age do men usually discontinue working from inability to bear the fatigue of work ?—It is not in my power to state an average, but some are obliged to give up work before 40 ; some work till 45, and some till 50.

16,406. Do many attain the age at which they become entitled to pensions, namely 65 ?—I am afraid not, but I cannot speak with certainty ; it must be a small proportion, I should say.

16,407. What is the general moral character of the lead miners ?—I should say pretty good; for instance, with regard to intemperance, in intoxicating drinks, they are pretty free from that, as far as I am able to judge.

16,408. What are the prevailing vices ?—The prevailing vice of this country, I am sorry to say, is want of chastity.

16,409. With respect to honesty, how are they ?—Generally speaking, they are strictly honest.

16,410. Have you had sufficient experience of the working population in any other parts of the country to enable you to compare the general conduct of the lead miners with that of other workmen ?—I practised in an agricultural district for five years before coming to Middleton, namely, in Wigton in Cumberland, amongst an almost purely agricultural population (certainly there was a sprinkling of coal mines) ; and as far as I am able to judge, and as far as I recollect, perhaps not devoting strict attention to the affair (I should not like to speak dogmatically on the subject), the moral character of the miners will stand very favourably compared with the agricultural population of Cumberland.

16,411. (*Mr. Holland.*) In the respect which you have just stated ?—Yes ; I believe that it is about equal.

16,412. (*Mr. Austin Bruce.*) Does the miners' disease in any way affect the constitutions of their children ?—Not that I am aware of.

16,413. Are the children generally healthy and robust ?—Yes, until they begin mining operations.

16,414. (*Mr. Holland.*) Is there any excess of scrofulous disease among them ?—There is a good deal of scrofula.

16,415. Is there any excess ?—No. We must take into account our climate, and we must take into account our locality.

16,416. But compare it with a similar climate ?—Compared with a similar climate there is no excess of scrofula here, but we have a great deal of consumption of the lungs in those who are not working in mines.

16,417. Do you attend the women as well as the miners ?—Yes.

16,418. Do they suffer from phthisis ?—Yes, a good deal.

16,419. Have you noticed true phthisis most amongst the men or the women of the miners ?—It is quite as common amongst the women as amongst the men.

16,420. Is it not more common ?—It is, perhaps, a little more common. I have not noticed it particularly, but from general recollection I can call to mind case upon case which I have had, and I can state that it is my opinion that phthisis prevails (I mean real phthisis from tubercles) more amongst the women than amongst the men.

16,421. Do you consider that the miners are healthily lodged in their dwellings ?—Yes, generally speaking.

16,422. As well as agricultural labourers ?—Better.

16,423. And better fed, or the same, or how is it ?—With regard to the food it very much depends upon themselves.

16,424. What is the fact ?—I should say that they are fed quite equally ; what I was alluding to was a circumstance more applicable to the woman of the house than to the man; they are too much inclined to live upon unleavened bread ; that is to say, cakes made on what they call the girdle, — heavy indigestible bread.

16,425. Is that the practice of the miners or the practice of the country ?—It is the practice of the country, but very much the practice of the miners.

16,426. Is it more particularly the practice of the miners than of the agricultural labourers ?—No. We have very few agricultural labourers here. The country is almost entirely mining ; but I should say that it is the general practice of the country to use that bread.

16,427. Is dyspepsia prevalent among the miners ?—Yes.

16,428. Unusually so ?—No, not unusually. This chronic bronchitis, of which I am speaking, will unhinge the system.

16,429. Does dyspepsia precede bronchitis or bronchitis precede dyspepsia ?—The bronchitis precedes the dyspepsia, beginning when a man is young; and he very often has dyspepsia when his health has been a little shattered by repeated attacks.

16,430. Do you attribute that dyspepsia to the shattered state of the men's health from bronchitis, or to some other cause ?—I do not mean to say that dyspepsia is a common accompaniment, but I meet with it now and then as an accompaniment of this chronic irritating disease of the lungs.

16,431. As an accompaniment, or as a consequence ?—I would not say a consequence ; I am scarcely in a position to say that.

16,432. Have you ever heard them complain of loss of appetite, or bad appetite, from mine air ?—No.

16,433. Do you think that they eat with as good an appetite as other workmen, or are their appetites delicate and capricious ?—I should think that the appetite is rather delicate.

16,434. Are they fond of rich and stimulating and more tasty food than other workmen ?—No, they generally live on very simple food.

16,435. Insipid food ?—Yes.

16,436. They have not any craving for tasty, high-seasoned food ?—No, decidedly not.

16,437. Do they ever complain of great heat in the mines, or closeness of the air. Do they attribute any of their disease to closeness or heat of air in the mines ?—I have not heard any one attribute disease to that.

16,438. Or do they complain of discomfort in the mines ?—No, certainly not.

16,439. You would be sure to hear of that if it were the case ?—Yes, decidedly so. I have now and then heard a man say that in his life he has worked in a bad place, in a close fore-head. That may be one case out of 400 men.

16,440. That is a very rare thing ?—Yes, I feel certain of that. I can speak with confidence on the point, that I do not hear it made a subject of complaint.

16,441. Do they complain of the candle smoke as a source of annoyance ?—No, I have not heard the smoke of candles complained of.

16,442. Have you never heard them attribute any of their disease to that ?—No, decidedly not.

16,443. Do they complain much of the powder smoke, the reek ?—They do not complain of it much ; they do not complain of it to me, at all events.

16,444. You think that it is mostly the dust of the rock ?—Yes, decidedly.

16,445. Would that give a clay-coloured yellow spit ?—No, it depends upon the stratification ; because the blasting of the rock with the lead ore is of a bluish colour ; but my impression is that the dark colour is produced by the smoke of the exploded powder.

MIDDLETON.
Mr. W. Ewart.
10 Oct. 1862.

16,446. It is black ?—Yes, blackish ; carbonaceous, as if it contained a little carbon.

16,447. Is it a rare thing for men to get above 40 without being touched in their lungs permanently ?—Very rare indeed ; I cannot call to mind having met with a miner who is not more or less affected with shortness of breathing before he is 40 years of age.

16,448. Permanent shortness of breathing ?—Yes.

16,449. At what age do you consider a miner an old man ?—I should consider a miner really an old man at between 55 and 60.

16,450. A decidedly older man than an ordinary workman ?—Yes, than an agricultural labourer, for instance, decidedly.

16,451. Or a joiner ?—Or a joiner, or a mechanic of any sort.

16,452. Very distinctly so ?—Distinctly so.

16,453. (*Mr. St. Aubyn.*) Is the Commission distinctly to understand that you have known several cases of men who have lived eight years after leaving their work, and who at intervals during that time have been subject to a discoloured expectoration ?—Clearly so. I understand the question thoroughly, and I answer distinctly.

16,454. (*Mr. Holland.*) Do you not think that it is probable that this discoloured sputum may be a secretion of the lungs, and not an excretion of that which has been received into the lungs ?—I should say that it is possible, simply stating an opinion of my own. I say that it is decidedly possible that this dark matter, whatever it may be, may be secreted by the lungs.

16,455. Do not you think that it is probable that the slight discolouration which you speak of as continuous is a secretion, whereas the large quantities which come very occasionally may be an accumulation in the air cell or otherwise ?—I will state the hypothesis which I have. I reason in this way : a miner, during his work in the mines, is continually breathing an air loaded with matter of this colour ; daily as he goes from the mines he spits up a little of this coloured mucus, and after leaving the mines he has an acute attack ; this acute attack spreads more or less over the lining membrane of the air tubes, and perhaps sometimes even extends into the cells ; that after a short duration brings on an excited action and an increased secretion ; and my hypothesis is, that during that state of activity of secretion it loosens, as it were, and carries off this accumulated impalpable powder. We never find the whole lung affected with this acute attack of bronchitis, it is only portions of it, portions of the tube and portions of the air cell ; but subsequent attacks affect other portions of the lung and bring away other portions of this coloured matter, and attack after attack, as far as I am able to judge, affects a large portion of the lung, ultimately, perhaps, affecting nearly the whole substance and producing increased secretion from a large extent of mucous membrane ; it dislodges a quantity of this coloured stuff, and at last is so severe as to kill the man, and though I have had no post mortem examination, still my impression is that if there was a post mortem examination there would still be a portion of this coloured matter found in the cells or small tubes of the lung ; that is the hypothesis which I hold.

16,456. (*Mr. Austin Bruce.*) My difficulty in following your statement is this: I can understand that a man who had been for many years inhaling this dust might be giving out a certain portion of it for the rest of his life, but I cannot understand how the portion which he gives out from time to time should be sufficiently large to discolour the copious expectoration which you have described ?—When we say "copious," it depends upon the quantity ; and there is another consideration, this colouring matter is not deep, the spittings are generally simply streaked; there is with them a thin streak of blue through the middle of the sputum, and the colour shades off. There is evidently in this expectoration not a great quantity of colouring matter in weight.

16,457. (*Mr. Holland.*) Are the men apt to breathe any smoke elsewhere ?—No.

16,458. Are you aware that the inhabitants of smoky towns constantly spit up black sputum when quite well ; mucus tinged with soot ?—Yes, I believe so, and I know that the colliers are accustomed to spit up immense quantities of black expectoration.

16,459. The black matter of the sputum is very small in quantity ?—The colouring matter is evidently small in quantity. A very small quantity of this colouring matter will tinge the expectoration. In these men of asthmatic breathing, in the progress of its passage from the lung it is positively churned and mixed up with the bubbling of the air.

The witness withdrew.

Adjourned to To-morrow, at Redcar.

REDCAR.

Saturday, 11th October 1862.

PRESENT :

The Right Hon. Lord KINNAIRD, K.T	H. AUSTIN BRUCE, Esq., M.P.
NICHOLAS KENDALL, Esq., M.P.	RICHARD DAVEY, Esq., M.P.
JOHN ST. AUBYN, Esq., M.P.	P. H. HOLLAND, Esq.

The Right Hon. Lord KINNAIRD, K.T., in the Chair.

Mr. JOSEPH WHITWELL PEASE, examined.

REDCAR.
Mr. J. W. Pease.
11 Oct. 1862.

16,460. (*Chairman.*) Will you be good enough to mention the name of the mine in which you have the chief interest ?—We have two ; Upleatham, which we hold under Lord Zetland, and the Hutton mines, which we hold under the Crown, and one or two smaller freeholders.

16,461. What other mines are there in this district ?—There are the Eston mines, worked by Messrs. Bolkow and Vaughan, and there are the Normanby mines and the Skelton mines, which are worked by Messrs. Bell, Brothers, of Newcastle.

16,462. Are there any other mines of importance ?—There are also the Swainby mines, which are worked, I believe, by Messrs. Holdsworth and Benington, not far from Stokesley, but they are worked to a comparatively limited extent under a lease from Lord Ailesbury ; they are, I suppose, 22 miles from here (Redcar).

16,463. Are there any other mines ?—Yes ; there are Captain Challoner's mines, which are worked by Mr. Attwood, near Guisborough ; they are worked to a considerable extent.

16,464. Are these mines all worked on the same principle as yours ?—Yes, as far as I know ; I have not been in all of them.

16,465. Is the description of the ironstone the same ?—Yes, precisely, for all practical purposes of your inquiry.

16,466. How many men have you working underground in your mines?—At the Hutton mines we have had on the average 121 men per day, extending over a period of six years; we have fewer in the mines at the present moment.

16,467. Have all these men been working fairly underground?—Yes; I have not included the outside men.

16,468. Will you have the goodness to state to the Commissioners the way in which the men enter the mines?—They enter the mines entirely by what we technically term "from the day," by levels; they do not go either up or down shafts.

16,469. Can you state shortly the manner of working with reference to the lie of the ironstone?—Owing to the railways being nearer to the outcrop of the stone, almost all the Cleveland mines have been worked "to the dip," and at the Hutton mines most of our workings have been rather to the dip; but they have been, since we got further into the hill, turned away on the principle of a water level, just making so much fall to the outcrop as brings the water away.

16,470. What is the greatest length of any level?—The greatest length of any level that we have is 1,820 or 1,830 yards.

16,471. Is that in a straight line from the day?—Almost straight; there is a slight curve in it.

16,472. Do you work by cross-cuts from that?—Yes.

16,473. Do you find any difficulty in ventilating the mines to the extreme ends?—We have had none at all; we have adopted the ordinary mode of ventilation that is generally used in coal mines by a furnace, and in these mines we have five ventilating shafts. The furnaces are now working in four of them, each of these shafts is six feet in diameter, the depth varying from 10 to 30 yards; there are only two furnaces to the dip; they each produce about 27,000 cubic feet of air per minute per furnace.

16,474. Does the air enter by the level?—Yes; and after passing through the workings of the mine returns to the furnace, which is not very far from the entrance of the level in the back course; every level is driven double.

16,475. Have you two upcasts in the whole?—Yes; at the present moment every level is driven double, and cross cuts for ventilation as far as it will go in.

16,476. What is the size generally of the levels that are driven?—They are five yards wide; and the height of the stratification varies from six to seven feet.

16,477. Do you find that the furnace not only ventilates but also has the effect of drawing the smoke away?—It draws the "powder reek," as it is called, away, and also the foul air that is generated by the horses and men; but we have never tried, and I believe there has not been tried, any other mode of ventilation in the Cleveland mines, coals being cheap and the furnace always being considered the most effectual method.

16,478. Is the ore all moved by blasting?—Yes, in the first instance.

16,479. Are you obliged in order to make this furnace work to have any trap-doors or any similar contrivances?—Yes; the whole of the return air is regulated by trap-doors, with boys to attend to them, to see that they are shut.

16,480. And occasionally is it carried across the levels?—Yes; it is carried across.

16,481. In brick tunnels?—Yes, or else in closely-planked wooden ones; but we prefer the brick ones.

16,482. Do you know the quantity of coals that one of these furnaces consumes?—About a ton and a half a day, I think, is the average quantity in each of them.

16,483. What is the price of coals at the present moment?—About 5*s*. a ton.

16,484. Is the furnace any larger than is absolutely necessary for the ventilation?—No, I think not; but the air in all our mines is exceedingly good.

16,485. You think it requires as large a furnace as you have described?—Yes; the difference between the quantity of coals is so small, and the better the air the better your mine is liked by the men.

16,486. If the miners are driving any foul ends have you any means of supplying them with air?—None, but having the air very regular in the rear of the men; if we only drive one end we have no return course, except the cross-cut immediately behind them.

16,487. Do you find that in driving a headway there is ever any deficiency of air?—No; as soon as it gets close or uncomfortable for the men we cross-cut immediately, closing the cross-cut behind.

16,488. What distance would you leave?—Our cross-cuts are only about 10 yards apart; the men are close to the air the whole time. If we did drive a headway further we should divide it by a timber or cloth brattice; you can carry that close up, and to so great an excess will you have good air that you will make the men so cold as to make them uncomfortable.

16,489. Have you ever used a cloth brattice in the iron mines?—No.

16,490. You use powder, I presume?—Yes.

16,491. A cloth brattice is used in coal mines?—Yes.

16,492. Does it answer perfectly well for the purpose?—I think that they generally prefer timber as being more durable.

16,493. But supposing it was only required for a short time, should you use it?—Yes; we saw regularly for the collieries brattice deals, very thin; they are easily nailed up and taken down again.

16,494. Would not the cloth answer?—Yes, very effectually; we have employed it in sinking shafts.

16,495. You have divided them with cloth brattices?—Yes, and they have answered perfectly well.

16,496. For creating a circulation, or for making a return current?—Yes.

16,497. Have any accidents occurred in your mine from blasting?—Not directly; I think not one. Most of our accidents have been indirectly from blasting, either by the men going in too soon, or else from the roof falling after they have been in. In these mines we have only had, in the course of six years, ending 31st December 1861, (and I have not gone further back) four fatal accidents. One man was killed in 1856 by the fall of stone from the roof; one boy was killed in 1857 from a horse running away; one man was killed in 1858 from the stone falling upon him that he was working under, and one man was killed in 1859 from the roof falling. Since that we have had no fatal accident.

16,498. I suppose that the greatest risk to which the men are liable is the falling of the stone from the face?—Yes; and in my opinion it is generally from their own carelessness and anxiety to get quantity.

16,499. Do you use timber in the mines?—Yes.

16,500. Is that timber supplied to the men, and do they put it up?—No; we have men whom we term deputies, whose care it is to see that the men are properly supplied with timber, and that the mines are properly protected with it.

16,501. That is their special business is it?—Yes, that and the laying down the ways to the men who are working.

16,502. Is it their business to see where the timber is required?—Yes, and if any man calls their attention to his place it is their duty at once to go to it. At the time of the last accident from the roof falling the deputy had just put up a prop behind a man, and the roof fell within, I believe, two feet of the end of his place of working.

16,503. How are the bargains made with the men, by the ton?—Yes, and we pay them for the actual work that they get out. We weigh every tub that comes out, and pay the men a price per ton according to the weight of the tub that he sends out.

16,504. How often are these bargains made?—All our men are under fortnightly hiring, and these are the conditions of the hiring (*handing in the same*).

REDCAR.

Mr. J. W. Pease.

11 Oct. 1862.

16,505. How often are the men paid ?—They are paid fortnightly up to the end of the previous week.

16,506. Then there will be one week in arrear ?—Yes ; we pay on Friday up to the previous Saturday.

16,507. Do you find that that mode of paying on Fridays is attended with advantage ?—At the Hutton mines we adopted the practice of paying on Friday in order to give the men an opportunity of attending Guisborough market on the Saturday.

16,508. With how many men is a bargain made ?—It is made with every man individually, but they generally work in pairs.

16,509. How many men are there in a pair ?—Two men ; these accidents have been in the proportion of one to 179,301 tons.

16,510. Amongst how many men ?—On the average 121 men.

16,511. You bring out nothing but iron ore, I suppose ?—Yes, we bring out a small quantity of iron pyrites, which goes down to the sulphuric acid works.

15,512. Is it enough to affect your estimate ?—No, the whole of the stone that we work out goes into the market ; we have no division in the strata.

16,513. In case of accidents have you made some provision for the men ?—Not on these mines ; we are here within a short distance comparatively of the houses occupied by the men ; we have no hospital on these mines, nor do we make any further provision than this ; we pay a doctor 25*l.* a year, and the married men pay 6*d.* a week, the single men 3*d.* a fortnight, which includes medical attendance on their families. To that subscription we add 25*l.* a year, and we also pay 5*s.* a week smart money, as it is called, for men who are out of work from small accidents or from ill health.

16,514. What deductions are made from the earnings of the men for candles ?—The miners pay for their candles and for their powder ; we supply a few of the candles, but not many ; they buy them principally at the shops, but we supply the whole of the powder, and the net earnings of the men, after these deductions had been made, averaged in the half-year ending 30th June 1861, 4*s.* 4*d.* a man per day ; in the half-year ending December 1861, 4*s.* 2*d.* per man per day ; and in the half-year ending 30th June 1862, 4*s.* 3½*d.* per man per day.

16,515. How many hours a week do the men work ?—I should think that the average time will be about 11 days a fortnight.

16,516. About how many hours a day ?—They go in about seven o'clock, and come out at three o'clock or four, according as they finish their work ; about 11 days a fortnight.

16,517. Should you say that these miners are a healthy class of men ?—I cannot answer the question from not having given particular observation to that, but I hear no complaints from the doctor. My own view, in looking at the men, would be, that they were healthy, but there has been no time to test the longevity of the miners working in the mines I have referred to ; they were opened out in 1853, and it is therefore only nine years since they have been in operation.

16,518. Do you have many men on the sick list at any one time ?—Not that I am aware of.

16,519. Do the men ever complain of shortness of breath ?—I have never heard any complaints of that kind.

16,520. Are the men subject to any special complaint connected with their working in the mines ?—I never heard of any. Most of our men are in clubs, the Foresters or Odd Fellows or Free Gardeners.

16,521. Do the men reside near the mines, or at what distance from them do they live generally ?—I should think about one-half of the men reside within half a mile of the mines, and the other half reside about a mile and a half from the mines in the town of Guisborough.

16,522. Should you say that there is a want of accommodation for the men in the way of dwellings ?—At present in Guisborough there is a surplus of houses ; the place is rather over-built.

16,523. What annual rent do the miners pay for their cottages ?—From about 2*s.* a week to 2*s.* 6*d.* There is kept on the mines a log-book in which is entered all the accidents and anything that occurs during the day, the pressure on the boilers, the horses employed, and men, and any general observations that the different foremen think ought to be recorded during the day.

16,524. Is that book often submitted to the inspection of the manager ?—Yes, it is his book, in fact ; and when he comes on to the mines, if he has not been there the whole of the previous day, he knows everything of importance that has occurred. I was going to say that there is on these mines a school, which has cost about 1,200*l.* The Committee of the Privy Council on Education granted about one-half of that money, the Commissioners of Woods and Forests providing a site at a very low rate.

16,525. Do the men generally contribute to that school, or only those who send their children to it ?—Only those who send their children ; they contribute 2*d.* a week per scholar, and the rest of the expenses are borne by the owners of the mines. There is also a reading room which is called the Mutual Improvement Institution, which is well frequented in Guisborough ; and there is on the mines another to which we have largely contributed ; the reading room is generally well filled.

16,526. Is there any compulsion used with regard to the men ?—No ; the school is on the British and Foreign principle ; there is one in Guisborough, a National school ; some go to one and some to the other. We give a subscription to the National school ; for although it has an endowment, it is not entirely independent.

16,527. Referring now to the Upleatham mine, will you have the goodness to state whether that mine is entered in the same way ?—The entrance is in the same way.

16,528. What is the length of the longest level ?—About 800 yards.

16,529. Do you adopt there the same plan of ventilation ?—Yes, the same plan of ventilation is carried out ; but the stratification varies from 10 to 11 feet in height ; as compared with the other, it is rather higher.

16,530. Have you one furnace at work there or two ?—There are four shafts, producing a current of air equal to about 50,000 cubic feet of air per minute to each furnace, all of them having furnaces in them.

16,531. Is the mode of working the mine different from the other ?—There is no difference in the mode of working, but the height of the stone has made it rather more dangerous on account of the men having a greater temptation to work under the stone, and to bring large quantities over.

16,532. Do you leave a certain proportion of the stone to serve as a roof ?—Yes, a small portion of the stone is left as a roof.

16,533. Is that taken out afterwards or left ?—It is generally left in.

16,534. The support is given by leaving a part of the stratification as a pillar ?—The roof is at present supported by the stratification being left as pillars ; there is of course in the main ways a great quantity of timber used, and we have worked very few of the pillars out, and shall not work them out until we abandon that part of the mine which is at present standing in pillars.

16,535. Do you ever use stones for arching your principal levels ?—We have used bricks where there has been any fear of the roof not standing permanently in the main drifts under the bed of ore, so as to keep the roof perfectly good over the main ways and horse ways. This mine is entirely worked to the dip, and the ore is raised to the surface by means of standing engines.

16,536. Is it drawn up by wire ropes ?—Yes, by steel wire ropes.

16,537. Do they run upon pulleys?—They run upon rollers or sheaves.

16,538. Have you had any experience as to the wear and tear of the iron rope?—The wear and tear in these mines has been exceedingly favourable. I think that one iron rope on the outside incline drew upwards of 1,500,000 tons before it was removed; it is a round rope 3 inches in circumference, and the load is 27 tons; it draws 27 tons on a self-acting incline at a gradient of 1 in 11.

16,539. What kind of rope is that which draws the waggons out?—A steel wire rope. We never had more than one yet, and that has lasted 14 months.

16,540. How does the wear and tear of the wire rope show itself?—By the single wires breaking; they are inspected every day. If the wires are found to be breaking they are removed; but all the wire-rope makers will furnish a spare rope, free of cost, in order to get a fresh order, so that we have always a spare rope on the place.

16,541. Do you repair the wire ropes on the spot?—Yes, with a "long thimble," as it is called; we repair it by laying in a splice of about 15 yards, so that you can work the two ends into the new piece that is placed in the middle. There are six wires or six turns in the rope, six strands, and six wires in each strand.

16,542. Suppose you saw one of those wires or one of the strands giving way, would that be sufficient notice to you to repair it?—No, only to fasten the strand into it.

16,543. When do you consider a rope to be dangerous?—When we see four or five of the wires in a strand broken, then it is at the point of danger. With regard to the wire ropes, I may mention that we are drawing up something like 24,000 tons of coals a week, and we have not a place but that has one of the wire ropes, both underground and above.

16,544. That is in the coal mines?—Yes.

16,545. Where they are drawn perpendicularly?—Yes, or along inclines underground.

16,546. Have any accidents occurred from the breaking of the ropes?—We have had an accident from the tubs running away on one of the inclines below, but not more than one or two fatal accidents; not from the breaking of the rope; it was from the tubs, as the balance weight not being properly fastened on; they were not on at all.

16,547. Have any accidents arisen during the conveyance of the men down these pits by the breaking of the rope?—I am not aware of any. I do not recollect any.

16,548. Over how long a period does your recollection extend?—We have worked with wire ropes more or less for the last 14 or 15 years.

16,549. Do you ever use any hempen ropes?—Yes, constantly.

16,550. Can you speak as to the comparative safety and the comparative expense?—Yes; I can say that wire ropes are much more economical and quite as safe. I do not hesitate to say that.

16,551. Are they not safer?—I should say so; but, without looking at the statistics, I should not like to give a decided answer to that.

16,552. (*Mr. Holland.*) Can you say that the wire rope is quite as safe as the other?—I have no hesitation in saying so; I go down with them constantly.

16,553. (*Chairman.*) With regard to accidents happening in the mine, is any provision made for the immediate care of the men?—Yes; we have furnished a small hospital in the village of Marske, to which Lord Zetland subscribes very handsomely, and that is attended by a nurse, whom we got from the infirmary at Newcastle, and she has the common hospital stores by her.

16,554. Have you any means of conveying the men to the hospital in case of accident?—We have procured two of the Government ambulances to be at the mines in readiness.

16,555. Is there any case in the hospital now?—There has not been one for four or five months, I believe.

16,556. (*Mr. Austin Bruce.*) Do you take any but cases of broken bones to the hospital?—Yes; cases of broken limbs, or a crushed foot or hand, or anything of that kind, they are taken at once to the hospital. We found that in the cottages the nursing was of so inferior a description that we thought many of the men who were lost, were lost from want of proper nursing, soon after the accident.

16,557. You do not send cases of sickness to the hospital?—No. From 2nd July 1858 to 26th September 1862 we have lost eight men; three from the roof falling, and five from their pulling stones over upon themselves; these were all fatal accidents. The number of the men employed in those mines is at present 320, and the vend is going at the rate of about 428,000 tons a year.

16,558. Have you any prejudices to overcome in inducing the men to go to the hospital?—None at all; they went, after the first man or two had been in, and found the nurse so efficient that they liked her better than the doctor, and they come to her to get their fingers dressed, or anything of that kind.

16,559. (*Mr. Kendall.*) How many men have you ever known to be in the hospital at the same time?—Two; one with a broken leg, and the other with a crushed foot.

16,560. What amount of accommodation is provided there?—There are five beds. The smart money that we have paid in these mines from 30th June 1858 up to 26th September 1862 has been 24*l.* 15*s.* 8*d.*; and the same rule as to the doctor applies there as it does in the other mines.

16,561. (*Mr. Austin Bruce.*) Was the establishment built as a hospital, or did you simply convert cottages into a hospital?—We built it for a hospital in connexion with some cottages that we were then building.

16,562. (*Chairman.*) How are the men provided with dwellings in the neighbourhood of that mine?—Some of them hire, and others live in our own houses. I think that all the men have gardens of about 22 yards square; the men who are living in our houses have their houses and coals for 4*s.* a week; the coals, we consider, cost from 1*s.* 3*d.* to 1*s.* 6*d.* a week.

16,563. (*Mr. Kendall.*) How many rooms do the houses consist of?—Two rooms upstairs and two rooms downstairs; and connected with the house there is a pantry and small offices, besides a coalhouse.

16,564. Do you know what the height of the bedrooms is?—Eight feet to the eaves, and about a foot or a foot and a half more out of the roof.

16,565. What is the size of the rooms?—The size is 14 by 16, and 14 by 10.

16,566. Would it be desirable do you think to have a third bedroom; there being two rooms downstairs they sleep in one of the downstairs rooms, which is equivalent to a third room.

16,567. Have any accidents occurred in the mines from blasting?—No fatal accidents from blasting.

16,568. The stone does not give out fire?—No, not even in drilling. The net wages at these mines were 3*s.* 9*d.* for the half year ending 30th June 1861; 4*s.* 1½*d.* for the half year ending 31st December 1861; and 3*s.* 11*d.* for the half year ending 30th June 1862 they run very much the same.

16,569. Have you any boys working underground?—Yes, driving the horses and trapping, that is to say, shutting the ventilating doors; we have no limit as to age, but we have none employed in the mines under 10.

16,570. What is the youngest age of those who perform the labour of a man?—At a guess I should say not younger than 19.

16,571. Do the miners work single or double handed?—There are two men in a place, double handed.

16,572. Are you troubled in the mines with water at all?—No, the mines are perfectly dry; we had a little water some time ago, but we put in a bore hole at

REDCAR.
Mr. J. W. Pease.
11 Oct. 1862.

the top of our workings several hundred yards beyond the point that we attained, and the water sprung through the bore hole and flowed out from the surface of the hole, the section of the hill under which we work being a cone.

16,573. (*Mr. Austin Bruce.*) Where does your population come from?—I believe principally from the surplus of the navvies after the railways in the neighbourhood had been finished; very few of them were originally miners, some few of them came from the mines in the west of the county of Durham, and a few from the collieries; I think that the principal part of them have been educated in this district.

16,574. They have come from all parts?—Yes, from all parts; Staffordshire and Wales have sent a few.

16,575. Do you observe much difference between them and the more stationary population of the district?—Our men have now been gradually weeded out of the rougher hands; those we have sent away, and we have now, I think, a very orderly set of men; or else you never do in a newly settled district get the cream from the other districts.

16,576. Upon the whole you consider them a steady and orderly set of men?—On the Upleatham mines inside and out there will be about 500 men, and there is one policeman in the village of Marske who is paid by Lord Zetland and ourselves, and I believe he is deficient of employment. There is also in Marske a new reading room to which Lord Zetland has contributed very handsomely; the rest has been done by private subscription; and there is a British school to which most of the children go.

16,577. In the favourable circumstances under which your workmen are employed underground, do you consider that their health is at all worse than that of the men who are employed on the surface?—I am not able to answer the question from any data, my own judgment would be that they must necessarily suffer from working in less pure air. I cannot say that I have any reason for saying so, beyond the general impression that I think we should all entertain that that must be the case.

16,578. Do you observe any difference in the appearance of the men?—No; I think on a Sunday, when they are washed, they look as well as the outside men.

16,579. Do they not look more pale?—I should say that they were looking more pale when they come out of the mines in the afternoon, but that is after doing their day's work. I very seldom see them when they are going in.

16,580. What is about the age of the older workmen who are engaged underground?—There are old men at the furnaces; men who are working at 15*s.* or 16*s.* a week, who are I should think from 60 to 70 years of age.

16,581. They are doing the light work?—Yes; there are miners from 55 down to the age I have named, 19.

16,582. If they do not continue to be miners above 55, is that because the work is too hard, or because their health and strength have failed them?—From the district being newly settled it hardly affords me sufficient statistical information to enable me to answer the question, it would be merely opinion or a guess.

16,583. I think you have stated that there are no cases of men suffering from asthmatic complaints?—I never heard of any; I never, in going through the mines, met with a man who complained of asthma.

16,584. (*Mr. Kendall.*) What do you call an outside man?—A man who works on the mines on the surface; there are two or three locomotives, for instance.

16,585. Are the wages earned by the men outside equal to those earned by the miners below?—Almost all our men are paid a tonnage price, it depends upon their position and skill. I think that generally speaking the wages run rather higher in this district than in others.

16,586. Were you obliged to weed the men much in order to get rid of the rougher hands?—We did it gradually; where we saw that a man was unsteady, and only working for three days a week we got rid of him.

16,587. Do they change about or not?—Very little.

16,588. Are they becoming denizens here?—Yes; where a man has got a house furnished he has got it furnished to his own taste, and he has his garden, and he keeps a pig, and the men settle very much down.

16,589. Do they live well?—I think they live very well.

16,590. Do they live upon any peculiar kind of food?—No. I think they are all fond of meat; the best meat. I do not think they have the Cornish taste here for paste.

16,591.—Do they save money?—We have a penny savings bank, and a number of men subscribe to building societies; but, as a class, I should not say that they are very saving.

16,592. Do any of them keep a cow?—I do not think any of them do; we allow no man in any authority to keep a shop.

16,593. You have nothing like the truck system here?—No; the only trade there is in it is in the provision of powder and candles, out of which we obtain no profit.

16,594. What quantity of powder do you use?—At Upleatham we use about a ton and a half a week.

16,595. And notwithstanding that that immense quantity of powder is used, your ventilation is excellent throughout the mines?—We consider it exceedingly good.

16,596. Have the men to wait at all until the smoke clears away?—I was in yesterday with a large party, Lord Zetland, Mr. Gladstone, and others, and we heard a blast when we were about 10 yards off, and we were in in three minutes.

16,597. What is the average charge of powder and the depth of the hole?—It varies from half a pound to $3\frac{1}{2}$ lbs.

16,598. Suppose you used 3 lbs. of powder, how long would the smoke be in clearing away?—That would take generally less time than a smaller charge, for it would be deeper down, and it is more effective then—it is better consumed.

16,599. Your mode of giving support is by letting some of the stone remain—by forming arches. I suppose the arches must depend entirely upon the nature of the stone?—The arch, I think, has only been adopted in case of the working going through the adjacent strata.

16,600. Are there not many arches?—No.

16,601. (*Mr. Holland.*) Do your miners look as healthy as the colliers do?—I think more so.

16,602. Have you ever heard them complain of their appetites being injured by their work?—Never.

16,603. Which of the two earns the most, the colliers or the miners?—I think there is very little difference; I have known the colliers to earn as much as our highest men. The working prices that I have given have been averaged over all the earnings; I have known men earn in these mines 6*s.* 6*d.* a day, and I have known colliers do the same.

16,604. That is rather high in both cases, is it not?—Yes, that is decidedly above the average. There was one man, and I was present when he came out of the pit, who made this remark, "That is 12 days for "this fortnight, and 6 times 12 are 72."

16,605. Are the miners provided with dwellings at as cheap a rate as the colliers are?—In the collieries the men are almost always found with houses, in South Durham.

16,606. Are they charged less than their value?—No, they are charged no price at all; a man is found with his house and coals.

16,607. Is that the case with the miners?—No; with regard to these mines they all pay rent.

16,608. Then in effect the colliers are better paid,

as they save their rent?—Yes, if they work the same number of days.

16,609. You have said that four accidents occurred from the stone falling and the roof falling; do you think that is about a fair average?—In the Hutton mines there has been no fatal accident since 1859.

16,610. Are a large proportion of the accidents caused by the stone falling?—Yes, from the men's carelessness generally; the higher the seam, I think, the greater the danger.

16,611. Are the accidents in a large proportion from the stones falling down?—Yes.

16,612. Are the miners provided with long tools by which they could avoid the falling stone if they were careful?—Yes, they are.

16,613. Is any punishment inflicted by the owners of the mine if the miners, contrary to orders, expose themselves to danger?—We have discharged two or three men who we thought were constantly and unnecessarily exposing themselves, but we have no other punishment.

16,614. Is that done always, or only very rarely?—We thought that they were cases in which we ought to make an example.

16,615. In ordinary cases would no punishment follow, provided a man escaped from injury?—No.

16,616. Would it be just or politic do you think to make reckless exposure an offence?—I do not think it would; it is always said that self-preservation is the first law of nature, and you can hardly do much more than to impress upon the miners the necessity of caring for their own lives, and to follow it much further, I think, would almost bring the mines into disrepute amongst the men.

16,617. Are the men more deterred by the rather remote chance of severe injury to themselves than by the certainty of a small punishment?—I think so.

16,618. Does your experience confirm that?—I cannot say that we have tried it, and therefore we have treated only one side of the question.

16,619. You are not aware that experience has confirmed the reverse?—No, I am not aware of that.

16,620. Has any inconvenience arisen from changing the pay day from Saturday to Friday?—I am not aware of any.

16,621. Has great convenience to the men accompanied that change?—Yes, and we thought to the masters too, in this instance, that where the men were paid on a Friday, and spent their money on the Saturday morning, there was less temptation to drink on the Saturday night and on the Sunday.

16,622. Has experience confirmed that, that there is less temptation to drunkenness, because they are paid on a Friday night instead of Saturday?—Yes, I think so; but we have also employed on these mines a visiting missionary, and I think that his influence over the men has been decidedly good; our men are much more temperate than they were.

16,623. Do you attribute part of that effect to a change in the day pay?—Yes.

16,624. There has been no inconvenience to counterbalance that convenience?—No, they come to work on the Saturday morning as they did before.

The witness withdrew.

After examining other witnesses the Commission visited the Upleatham mines.

Mr. JOHN MARLEY examined.

16,625. (*Chairman.*) Will you be good enough to state the mines of which you have charge?—The Eston mines are the only mines in Cleveland of which I am the consulting mining engineer and manager for the lessees, Mr. Wm. Spencer, who is present, being the resident manager.

16,626. What is the name of the company?—Messrs. Bolckow and Vaughan are the proprietors.

16,627. Will you just state what the ore is that is raised in these mines?—Iron ore.

16,628. Will you be good enough to state to the Commissioners the number of men who are employed altogether, and next, the number of men who are working underground?—The number of men and boys employed at present in connexion with the ironstone mines is about 810, 618 of whom are employed underground.

16,629. What is the quantity of stone that is raised?—About 600,000 tons per annum, the maximum having been 638,620.

16,630. Do the men enter from the day level or horse level?—They enter entirely by adits or levels.

16,631. What is the length of the longest level?—The longest level is in connexion with the new mine we are opening, where there is a shaft, and it is very nearly a mile—1,672 yards—from the entrance of the adit to the shaft.

16,632. How many shafts are there in connexion with it?—There is only one shaft at present in connexion with the centre of the mine; but near to the adits there are other three or four shafts, of which we have taken advantage to get furnace power for ventilation.

16,633. The mine is ventilated, then, by means of a furnace?—Yes.

16,634. How many furnaces have you?—We have three furnaces, one of which is a double furnace. No. 1 furnace is 18 feet long by 9 feet broad, and is fired from the side. The double furnace is equal to a furnace of 18 feet broad by 9 feet long. The third furnace is only a small one, and is not at work at present, and of that I have not the dimensions.

16,635. Is the double furnace so constructed that it communicates, as it were, from back to back?—No, they are two separate furnaces in connexion with one shaft.

16,636. For what extent of level should you say that one of these furnaces is sufficient to drive away, not only the foul air, but the powder reek?—It would be almost impossible to give you an answer to that question, unless you defined the rise and the dip of that level. In fact, there is no rule that will apply to it. The way in which we ascertain whether we have sufficient ventilation or otherwise is to test the air per cubic foot per minute that we have per man, and seeing what that is, we then judge as to whether that is sufficient to take away both the powder smoke, and to move any gas or anything that might be impure. The average ventilation in our mines for the last three months has been 77,555 cubic feet, the minimum being 70,920, and the maximum 96,895, one furnace not being at work. Taking the number of men and boys underground at 618, and putting 80 horses down, making an aggregate of 780, we have 111 cubic feet per minute per man, boy, and horse, driven through the various furnaces and circulating through the mine. Then, inasmuch as a man requires only about a fifth part of a cubic foot per minute for actual inhalation, to enable him to live, if you have 111 cubic feet that gives a very large margin beyond. But inasmuch as these are never all in the mine at the same time, the margin is greater still.

16,637. In driving a fore end, do you think that that ventilation is sufficient?—Yes, quite sufficient.

16,638. How long would the powder smoke hang in one of those ends after the blasting had taken place?—It would vary somewhat in the different parts of the mine. In our mines perhaps a little longer, on account of the great height of the mine, that varying from 12 to 15 feet. But although we obtain a large number of cubic feet per minute, yet, on account of the large area, we do not attain the great velocity that there would be in a thinner mine. Hence the powder smoke is a little longer in getting away, although it is diluted to below the injurious point much more than even in a thinner

REDCAR.

Mr. J. Marley.

11 Oct. 1862.

mine, still it is a little longer in getting away; I should think about 10 minutes.

16,639. Owing to the larger space in which it is, of course you cannot exhaust, as it were, the air so rapidly?—Suppose a given quantity of powder smoke to be given out at a shot, I should say that in a seam of three feet thick, and having the same quantity of air, it would move much quicker than in a seam 12 feet thick, although you may get it diluted to a greater degree you do not get it away quite so quickly.

16,640. (*Mr. Holland.*) It is a larger but a thinner cloud?—Yes; that is it.

16,641. (*Chairman.*) How are the bargains made with the men?—Bargains are not required to be made at all often with the men; for instance, the same ton prices have been going on for four or five years, and unless there is some very extraordinary demand for men, or some very great depression of trade, those prices continue; they are all by the ton, except in Fore Winning, where the places are narrow and require to be driven of a less size than usual, in which, as well as the ton price, they have a price per yard. All those prices are fixed prices, so that a man knows what the price is, and every man is paid his own price.

16,642. (*Mr. Austin Bruce.*) When was your last reduction in wages?—In 1857.

16,643. And the price has been the same ever since?—There have been slight variations in prices since 1857, but no general alteration; what there has been has been a tendency upwards.

16,644. (*Chairman.*) How often are the men paid?—Once a fortnight.

16,645. On what day in the week are they paid?—On the Saturday, and they are paid up to the Saturday previous; their balance is struck and everything is included up to the Saturday night; the bills are made out, and it takes between the two times for the passing of the accounts, checking them, and so on. Each individual man is paid his own money; if they are working in pairs, there must be an authority or an understanding who is to draw the money.

16,646. What are the wages?—From December 1861 to June 1862 the gross earnings upon the average of every man were 5*s.* 2*d.* per day, less powder and candles, reducing it to 4*s.* 4¾*d.*, they paying for the houses and fuel themselves.

16,647. What is the case with regard to the supply of candles?—A man gets them where he likes; of course we know that he must pay for them, and we put down the sum of 2*d.* per day as an approximate cost.

16,648. He does not necessarily get them from you?—We do not supply them at all.

16,649. Do you supply powder?—When the Eston works commenced, consuming about a ton of powder a week, we found it impossible for the small shopkeepers to comply with the Act of Parliament, so that we have a powder magazine, not directly in connexion with the mines, a powder magazine where the men can get supplied; but they can get the powder where they like.

16,650. With regard to their tools, are they supplied or do they supply themselves?—The tools are entirely found by the owners.

16,651. And do men not pay anything for wear and tear?—No; if they lose them or damage them through carelessness they pay, but they pay nothing for the use of them if they have used them properly.

16,652. Do you use much timber?—In what we term the pillar or broken working a good deal of timber is required; in the whole mine very little.

16,653. That is to say, when you are taking out the pillars a good deal of timber is required?—Yes, from the height of the seam, but in the rest of the mine very little indeed is required; they leave a portion of stone to form a natural roof where possible; the cost for timber in the whole mine is trifling; the cost for timber in the pillars is large.

16,654. Are the men liable to accident from the falling of the roof or falling of the stone after blasting? Principally from stone falling after blasting; few from the roof falling.

16,655. Where the men are working?—Yes; it cannot be called the roof exactly, but at the face where the roof is in course of formation.

16,656. What would you call it?—The technical term would be the jud; it is in point of fact the bulk of stone which is partly prepared for coming down, and after the shot is fired a portion perhaps has not come down, and it comes down unawares afterwards; that comes down from the face of the work.

16,657. In the last year how many accidents have you had?—During this year, *i.e.*, 1862, we have only had two fatal accidents; we have been freer this year than we hitherto have been.

16,658. (*Mr. Austin Bruce.*) That is one death for every 300,000 tons of stone raised?—The stone which has been raised during that time is 456,000 tons, and is equal to 228,000 tons.

16,659. (*Chairman.*) It is two deaths out of 618 men underground?—Yes.

16,660. Is there any particular precaution which you adopt?—We have adopted all the precautions I think that we know how to adopt; we have established rules similar to the coal mine inspection rules; we are carrying out all the rules of the coal mine inspection, although we are not under inspection. We can show you the rules which we have established. We have what we term our safety rules and commercial rules; the former are divided into general and special rules. In some half dozen collieries which are under my charge for Messrs. Bolckow and Vaughan, we have adopted all the requirements which the Government inspection of the coal mines requires, and we also have adapted them to our ironstone mines. The only rule to which I think it necessary to call particular attention is as to miners, shifters, and putters. Rule 6 was a rule which we had found to answer very well in our coal mines, and it is to this effect: "That should the "working place of any man or boy become unsafe "from any cause he is to discontinue working in it, "and immediately to send for the deputy; but if "unsafe from want of timber being set, then in the "absence of the deputy, there being sufficient timber "in the place, the miner is to set it, in order to prevent "any accident, and report the same to the overman or "inspector." I have had occasion to vary that rule in one colliery, for which I was consulting engineer, in the same way as we have varied it here. This is the addition to rule 6: "After the word 'inspector,' read "and in all cases, *whether considered dangerous or* "*not*, the miner, when taking out a leg or using the "hack" (that is one of his tools) "underneath stone, "to set a punch-prop or sprag-prop so as to prevent "any accident; such props of suitable lengths will be "provided in each working place ready to be set." My reason for calling attention to that change of rule is this: In the first instance you will see that a man was to do this in case it became unsafe; of course the man was to judge whether it was safe or not, and in many instances, owing to its being more economical for his own pocket or from error of judgment thinking it safe, he did not set those props; and we have had, we may say, the bulk of our accidents originally arising from this cause, namely, that in carrying forward the heading or excavation after the shot had been fired, and a certain part had not come down, instead of setting the sprag-prop, the result was that they did not set these props when left to their own discretion to say whether it was dangerous or not. It was impossible, of course, for an officer to stand over every man, and notwithstanding verbal and positive orders to the contrary, we had three fatal accidents within a fortnight, I believe from that very cause, it being proved to the coroner's satisfaction that orders had been given, and hence you have the change of rule. We had deputations and a threatened strike in consequence of this change of rule, but one of the owners, and myself and the other agents, met the deputations, and we showed

to them that we must carry out the matter in that way whether the place was considered dangerous or not. We now enforce that rule.

16,661. These props are not at the men's expense ?—No.

16,662. (*Mr. Holland.*) How is the rule enforced ?—A breach of that rule would be followed either by dismissal or by a fine, or by being taken before the magistrates.

16,663. Do you find that virtually the rule is obeyed?—I believe that now the rule is virtually obeyed, although two or three men have been fined lately for a breach of that rule. I will now put in the commercial rules, in which all the fines for everything are set forth.

16,664. What are the deputy's duties ?—By way of properly illustrating more particularly what they are, I will begin with the getter of the stone, who is called the miner. The deputies are the persons who have to superintend the putting in of the timber and to see that every place is safe. Above those are the back overmen, then the overmen, and then the underviewer ; so that the deputies have to set the timber and to see that everything (under the other officers) is safe.

16,665. What proportion do the deputies bear to the number of men employed ?—About 1 to 12 ; it will vary a good deal according to the quantity of pillar working, whether it is a whole mine or a broken mine.

16,666. In the case of pillar working you have more deputies in proportion to the men ?—Yes ; but that answer embraces both pillar working and whole mine working. It perhaps should be explained that on account of the height of the seam and the extra difficulties, it takes three deputies to work at our mines what one deputy would work at other places.

16,667. Is the stone drawn from the mine and put into the waggons by the use of a steam engine ?—By stationary hauling engines, and by self-acting inclined planes down to the putting it into waggons, and by horses to the various stations.

16,668. For this purpose do you use a wire rope ?—Yes, entirely.

16,669. Is the wire rope used along any incline going into the mine or drawing up, that is to say, any ascending or descending incline ?—Yes ; about two inches to the yard ascending, and up to six inches descending.

16,670. How long have you used a wire rope in these mines ?—From the very commencement ; the wire ropes were first used in 1851 ; 11 years.

16,671. Have you found them fully efficient ?—The most satisfactory of any kind.

16,672. Should you consider the wire rope in regard to safety as safe as the broad hempen rope and the chain ?—In connexion with the inclines much more so. There is only one vertical lift at Eston at which we use wire ropes, all the rest being nearly horizontal, the greatest dip being two inches to the yard, and we prefer wire ropes.

16,673. (*Mr. St. Aubyn.*) What is the depth ?—It is in course of sinking ; it will be 90 fathoms ; it is now 52.

16,674. What is the size of the rope ?—Three and a half inches in circumference.

16,675. What is the weight of the material raised ?—Not more than 6 or 7 cwt.

16,676. Including the cage ?—Yes ; it is sinking where there are men below the rope. If you ask me as to the experience of raising weights with wire ropes elsewhere, I can give that independently. It is a much thicker rope than at present needed, but that is the rope which we should use for raising much heavier weights if we required it.

16,677. (*Chairman.*) How do you judge when the wire rope becomes worn so much as to be unsafe ? — The mechanical engineer on the works, whose duties are to examine the ropes every day, will soon see if any single wire is broken ; and if so, it is time to examine the rope carefully. Of course there is the usual length of duration, and there are the number of tons which those ropes have raised, and a conclusion can be formed as to whether the rope has been worn sufficiently long to be within the margin of safety. There are exceptions not only with wire ropes but with hempen ropes ; where a rope will show no change and will break. I have heard of a new 9-inch hempen crab rope which had not been on above six days breaking.

16,678. Would the wire rope be liable to clink ?—Not more than other ropes. Under the head of "Enginewright," a rule is "Once a day to examine "with the banksmen the shaft and ropes, shackles, "bolts, and engines, main and cage chain, and to see "that the rapper and wires are in good repair."

16,679. Do the men who are sinking that shaft go down ?—Yes ; they have to go down occasionally in connexion with the shaft from the surface, but they have access to the shaft by a drift about 50 fathoms from the surface.

16,680. From your own experience can you state anything to the Commission with regard to the use of the wire rope in vertical shafts ?—My experience upon that subject is that wire ropes are safer than hempen ropes ; but with this difference, that when we have got to a depth of from 100 to 150, or say 130 fathoms, we have departed from the round wire rope and have adopted the flat wire rope instead of it.

16,681. (*Mr. St. Aubyn.*) For the whole depth ?—Yes ; we never have a flat rope in connexion with a round one.

16,682. (*Chairman.*) Then for a greater depth than say 130 fathoms you would recommend the flat wire rope in preference to the round wire rope and to the flat hempen rope ?—I would.

16,683. Would you recommend that not only as regards the safety but also as to the more economical working ?—As to both.

16,684. And with that description of rope you would consider the ascending and descending quite safe ?—Perfectly so.

16,685. Can the wear of a wire rope be as well seen as in a hempen rope ?—Quite as well, in my opinion.

16,686. (*Mr. Kendall.*) Is a flaw in the wire more easily detected on a flat rope or a round rope ?—I should think that there would not be much difference, because a flat rope is composed of a series of round rope to a certain extent ; they are made of different strands.

16,687. (*Chairman.*) Will you state to the Commission your reason for recommending a flat rope for the greater depth ?—As you increase in depth you require the engine end of your rope to be thicker and stronger, having a greater length of rope to support. The manufacturers can increase that strength, and taper the rope much better in a flat rope. It is entirely a mechanical difference, and there is the winding on the engine-drum as well.

16,688. A flat rope would not occupy so much space on the drum ?—No, but that is not exactly the reason. You can coil any number of turns with a flat rope, but with a round rope it has to coil backwards and forwards, so that in going over the pulley it is many inches out of the direct line ; whereas at a great depth you are always in the direct line with a flat rope.

16,689. Should you consider that a wire rope was likely to suffer injury from any description of copper water or other mineral waters which it might have to encounter in its passage up and down the mine ?—I should think not. I believe that we have a case in the county of Durham where there has been the most deleterious water hitherto met with in connexion with metal pumps and tubbing and everything of that kind, and in that same place they were able to work wire ropes with safety. That is at a coal mine in the county of Durham, where they had very deleterious water indeed. They were obliged to use working barrels of different alloys of metals. In the volume of the "North of England Institute of Mining Engineers" for the year 1858 you will

REDCAR.
Mr. J. Marley.
11 Oct. 1862.

find a paper on that subject by Mr. William Armstrong, a mining engineer. In answer to that question, taken alone, I do not apprehend any difficulty at all; and I think that that is a good case in point where the water was such that in connexion with the pumping they were obliged to use means to counteract it. But in connexion with flat wire ropes, at that particular place there was no such instance.

16,690. Supposing that there was anything deleterious in the water, could it not be obviated by passing the wire rope through a mixture of grease or other preparation?—Yes, to a certain extent, by keeping a mixture of oil and grease combined very little water would adhere to the rope; but still, of course, if it came in contact to such an extent, there are waters which would be deleterious. I would, however, remark that there is no reason why it should be brought in contact with those waters, that is to say vertically; and even in an underlie, although there is more difficulty to keep clear, I do not think that any practical detriment would take place. There might be drops of water upon the rope, but I do not think that it would come upon it to such an extent as to cause any detriment.

16,691. Will you state your reason for that opinion?—Partly from the grease and oil upon the rope, and also from the constant moving of the rope over the sheaves, its influence would be very different to what it would be supposing it were lying steeped in water of that kind. I do not think that it would be kept upon it, or that there would be anything of that kind for a sufficient length of time to cause any practical detriment. I think that if there was water to such an extent as to cause detriment of that kind it would have a much greater effect upon a hempen rope. If you had water to such an extent coming upon it, it would have to be always what we may call poured down, and even under those circumstances I should prefer wire to hemp as a matter of economy.

16,692. (*Mr. St. Aubyn.*) Do you use wire rope in drawing the waggons along the levels?—Yes, and we have it at work in very wet places. That answer is in connexion with my practice as a mining engineer generally, and not with the Eston mines only.

16,693. Will you state the amount of difference which you have observed in the wear and tear of ropes used in those places, and of those used in perpendicular shafts where the water does not fall on them?—I am afraid that any answer which I should give would be mere guess-work.

16,694. Can you state approximately?—I cannot even state approximately.

16,695. Would they last half as long again?—The circumstances are very different, and the load to the wire ropes is very different upon the vertical to what it is upon the horizontal or nearly horizontal.

16,696. (*Mr. Austin Bruce.*) The friction is much greater upon the horizontal than upon the vertical?—Yes, and the loads are also different.

16,697. (*Mr. Holland.*) Is there any considerable wear of the rope if it is well held up by pulleys in the underlie?—No.

16,698. Is it not easily guarded from any great wear?—Certainly.

16,699. I notice in these rules that you have many for the protection of men from accident; are they enforced by your own regulations or by any general law?—There is a portion of the last Government Inspection Act which applies to all mines; that of course is enforced under the law. Those rules which you may term of our own making, but which are based upon the other, are enforced under the general law of the land; they are enforced partly by our fines, but if we think it a grievous case or a case of great importance, we have only to summon the person before the magistrates for a breach of that particular rule, which rule is made for the safety of the workmen, and they are punished by the law of the land.

16,700. (*Mr. Austin Bruce.*) The rules therefore become a part of the workmen's contract with the master?—Exactly so.

16,701. (*Mr. Holland.*) The particular rule to which you have called our attention, which states that all stone work underneath shall be propped, whether thought dangerous or not, is a special contract?—Yes.

16,702. You say that you call in the assistance of the magistrates; what assistance can the magistrates give you to enforce a special contract?—The magistrates will fine them or send them to prison.

16,703. Under what law?—I am not sufficiently a lawyer to answer the question.

16,704. You told us that you had a threatened strike by insisting upon the regulation?—Yes.

16,705. You considered the regulation very important?—I considered it extremely important; it has diminished the number of accidents.

16,706. Do you think it probable that in all mines a regulation, though so very important as this, would be insisted upon by the employers in the face of a threatened strike?—It is not applicable to all mines. In one colliery which we have to do with, one of Messrs. Bolckow and Vaughan's collieries, where a similar rule is requisite, the inspector has asked us to amend our rules, carrying out the very same thing in principle as we have done ourselves. That is an exceptional state of circumstances which requires that rule.

16,707. My question applied to mines which are not under the Colliery Act?—All mines do not require that special rule; it is not of universal application. Speaking from my experience, I should say that when they found that it involved a question of life and death they would do so.

16,708. Had you not yourselves some doubt as to the expediency of enforcing this rule in face of a threatened strike?—Not the slightest; with a possible verdict of manslaughter before our face, the question is to consider safety first.

16,709. If you had considered the danger to be guarded against less important, would you have yielded?—I would not sacrifice anything in connexion with safety for the sake of commercial prosperity. I may say that I have nothing to do with other people; I am answering for myself.

16,710. (*Mr. Austin Bruce.*) I suppose your population is like that which Mr. Pease has described as a mixed one, not drawn exclusively from this neighbourhood?—Not at all; we are very much better now than we were at the commencement of the mines. At the commencement of the mines they came from Staffordshire, and from all parts of the country; railway labourers came, and men not belonging to the district. We are now getting what I perhaps may designate as well-bred and proper settled miners.

16,711. And you have found an improvement in their conduct in consequence?—No doubt of it.

16,712. You have had experience both among colliers and among miners, which of the two would you say was the healthiest occupation. I am speaking with reference to the miners of this district?—I do not know that there is any particular difference. I could not make any difference between the health of the coal miner and the health of the ironstone miner. The only difference between the two employments, as far as regards the health, is, that having reference to the Eston mines, there is not the requirement of stooping or travelling in low heights, and hence that exertion is done away with; but taking it altogether, I am not aware that I could make any difference between the health of one and of the other.

16,713. Do you think that they are able to work for as long a period of life in one employment as in the other?—I should say quite so.

16,714. Are the wages the same in both employments?—No; in the ironstone mines they hardly will average quite as much; some men will make more, but as an average the coal miner will have a higher rate of wages on account of the free house and fuel.

16,715. To what cause do you attribute the difference?—I do not know, except this, that it requires in some works of coal mining a more ex-

perienced class of men on the one hand, and it is not so easily learned as the getting of ironstone; they require to be trained up to it in coal more than they do in connexion with ironstone. One is done more by the force of gunpowder than the other.

16,716. Has the danger from the explosion of gases anything to do, in your opinion, with the difference of wages?—No; we are not liable at all to explosion from hydrogen gas in connexion with our mines; we have seen such a thing, but I do not think that it has anything whatever to do with the difference of wages; of course there are coal mines equally free from gas as our ironstone mines are, and practically speaking there is no difference in the wage.

16,717. Have you observed among the miners any of that difficulty of breathing which is so common among the lead miners of this district at a certain age?—Never.

16,718. (*Mr. Holland.*) Are the ironstone miners quite as healthy as the colliers?—Quite so.

16,719. (*Mr. Austin Bruce.*) Can you give us the ratio of deaths to the quantities of stone raised in your mine?—Yes; since the commencement of the mines the total deaths in connexion with the machinery quarries railway outside have been 19; the total deaths inside have been 50, making a gross total of 69. The proportion for the inside deaths is one for 105,285 tons; the proportion for the outside is one for 277,066, making a gross average of one in 76,293.

16,720. (*Chairman.*) Are there any clubs connected with your mine?—There is a provident fund, to which all the fines from the men go.

16,721. Do the men subscribe to that provident fund?—They do.

16,722. What amount per week?—4*d.* a man and 2*d.* a boy.

16,723. Are they all obliged to subscribe?—Yes; unless they have previously provided for themselves by joining two duly authorized benevolent societies.

16,724. Is it for sickness?—For sickness, accident, and death.

16,725. Are the families attended?—Yes, the wives and children.

16,726. Is there a doctor?—Yes; 2*d.* a week for a man, and 1*d.* a week for a boy, is charged for the doctor besides.

16,727. Is a separate account kept of the doctor's fund?—Yes.

16,728. And of the other fund?—Yes.

16,729. Is the money which is received from the men and from the fines sufficient to meet all charges?—It has been so far.

16,730. Have the men an opportunity of examining the account?—Yes; there are officers appointed by the men at a public meeting once a year.

The witness withdrew.

Mr. ADDISON L. STEAVENSON examined.

16,731. (*Chairman.*) Will you state the names of the mines of which you have charge?—The Normanby mines and the Skelton mines.

16,732. Who are the proprietors?—Messrs. Bell Brothers, of Newcastle.

16,733. What number of men do you employ altogether on those mines, and what is the number of men underground?—I cannot state the number of men outside, I can state the number inside; the number of men underground is 100 at Normanby and 60 at Skelton.

16,734. How do the men enter the mine?—At Normanby they walk in and out, at Skelton they have been going up and down a shaft, but I have now put a drift out to the surface, we are walling it, and it will be finished in a fortnight, and they can then walk in and out as they choose.

16,735. When they went down the shaft, by what means did they descend?—By engine power.

16,736. By cage?—Yes.

16,737. A safety cage?—No.

16,738. Was the cage wound by wire rope?—Yes.

16,739. A flat or a round rope?—A round rope.

16,740. What was the depth which they had to go down?—20 fathoms.

16,741. About what is the quantity of stone in a year?—The Normanby mines have been producing 160,000 tons per annum. We are now opening the Skelton mines and getting about 100,000 tons per annum, we commenced in March last.

16,742. What is the height of the seam?—Normanby 8½ feet, Skelton 9½ feet.

16,743. Have you to use much timber?—Not more than the average in the district.

16,744. From what do the accidents arise to the men?—Principally from getting the stone down.

16,745. Is that after they have blasted?—Yes.

16,746. Do you take any precautions?—We have a printed rule, amongst the other rules, that before removing the portion supporting the weight of stone they shall prop it.

16,747. Have you had any difficulty in enforcing that rule?—No, I have not had any difficulty; I have had one case of a man killed in that way.

16,748. But you have had no difficulty in enforcing the rule?—When I have seen it I have told them, and they have immediately done it; I am not aware of any cases where they have not done it, excepting when this man was killed.

16,749. What means have you of enforcing it, by fine or otherwise?—Fine or discharge; I prefer discharging.

16,750. Amongst your rules are there many cases where men are fined?—We fine only in extreme cases; I am not aware that I have fined a man during the last six months.

16,751. Have you any fund in case of sickness connected with the mine?—No.

16,752. Or accident?—No.

16,753. Have you any doctor especially appointed?—We have a special doctor, whom we pay.

16,754. Do the men pay?—The men pay 3*d.* a week to the doctor. This is for general medical attendance.

16,755. But there is no club?—There is no club.

16,756. Do the men purchase their candles and powder from you?—They purchase the powder.

16,757. Not the candles?—No.

16,758. Are they supplied with tools, or have they their own?—We supply the tools.

16,759. Do they pay for the wear and tear of the tools?—No, they give them in when they leave; if they lose any they pay for them.

16,760. Do you pay every fortnight?—Yes.

16,761. Are there any schools attached to the mine?—None. I may state that I have been only six months in charge of these mines; matters of that sort I have yet to go into. It is the wish of the employers and myself that we should carry out everything which would be of any benefit to the men.

16,762. Are you engaged in carrying out any alterations?—I have not done so yet.

16,763. (*Mr. Austin Bruce.*) Do you ever have any complaints from the men as to deficient ventilation?—Nothing of any moment; for two or three days perhaps a place might be rather slack, until it got holed in another place.

16,764. In those cases do you apply any special means of ventilation?—Yes, we have a pump going in one case pumping 200 feet a minute for two men.

16,765. (*Mr. Kendall.*) What is the distance off?—About 30 yards from the main airway; it is owing to the large amount of stithe which is given off in that particular case, that is, carbonic acid.

16,766. (*Mr. Austin Bruce.*) Have you ever found the health of the men affected by breathing that gas?—My experience has not been long enough; I have

REDCAR.

Mr. A.L.Steavenson.

11 Oct. 1862.

not seen any men any worse for it, they have not complained to me.

16,767. Where has your experience been ?—Among collieries.

16,768. Do you observe any difference between the physical appearance of these men and of the colliers that you have been accustomed to ?—They are bigger and stronger men in this district and more of the character of the navvie. The colliers generally have a whitish pale appearance, and these men not so much so.

16,769. Then you consider these men to be a healthy class ?—I do, very.

16,770. Have you, from the records of the mines with which you are connected, any return of the number of deaths?—I can tell you the number, but I have no particular information as to how they occurred. There have been seven lives lost at Normanby during the time that we have been in operation.

16,771. How long is that ?—Nine years.

16,772. And in that time what has been the quantity of stone raised ?—It would average about 130,000 tons per annum, that is 1,170,000 tons.

16,773. (*Mr. Kendall.*) Have you more carbonic acid gas in your mine than in the mines in the neighbourhood ?—I should think that we have; we have rather more troubles in the strata, and we are putting through what is called a trouble where this is coming off.

16,774. How does it come off, is it through fissures ?—Yes.

16,775. Do you ever apply your candle there to see the effect of it ?—Yes.

16,776. Does the candle go out instantaneously ?—Yes.

16,777. Supposing that you put your candle in the centre of your fore-head, would it generally burn there ?—It would burn dimly ; that is in the place of which I have been speaking, of pumping the air in.

16,778. But when you pump the air in, does it burn well, or does it always burn dimly ?—It generally burns dimly if the pumps are not going, but if we set the pumps going it makes the place fit to work.

16,779. Although it is diluted largely, is it perceptibly different from the other ends?—No ; I cannot say that it is.

16,780. Though you are in a trouble, still by the application of this pump you so dilute this carbonic acid gas that the men are able to work freely ?—Yes.

16,781. (*Chairman.*) Is this at the Normanby mine or at the Skelton ?—The Normanby mine.

16,782. What is the length of the level ?—About 40 yards. When I speak of "the level" I mean this single place.

16,783. What is the breadth of the level ?—It is nine feet wide.

16,784. Have you any furnace ?—We have two small furnaces, and I am putting up a new one which is arger.

16,785. Do you think that the two furnaces are not sufficient ?—In the summer they are not sufficient.

16,786. Have you made any calculation as to the size of the furnace required ?—I am going to put up one six feet square.

16,787. Do you make any calculation of the number of men working as to the size of the furnace ?—I have not done so ; I know pretty well the effects of the furnace ; it varies according to the circumstances of the mine.

16,788. Will that furnace, in your opinion, be sufficient to extract this carbonic acid gas ?—Yes ; it will pass off as soon as we get holed to where we intend to go.

16,789. But even with the furnace it would not be sufficient without putting in air to that point where you say the carbonic acid gas is ?—The furnace would be sufficient.

16,790. Supposing you had another furnace in now would that be sufficient without introducing air ?—Yes ; this is a drift which is going to hole into another mine in the course of less than 100 yards.

16,791. It has no communication with the rest of the mine at present ?—No.

16,792. It is a new drift ?—Yes.

16,793. How far is it from the day ?—700 yards, and it is there that we meet with the stithe.

16,794. Does not that drift communicate with the other parts of the mine ?—We can walk into it from the other parts of the mine.

16,795. Cannot you extract the air ?—When you go into a single place without any communication the air falls dead.

16,796. If you bratticed that would it not have the desired effect ?—We have not yet sufficient furnace power to draw it through.

16,797. If you had sufficient furnace power, then you think that a brattice would be beneficial ?—Then we could draw it through.

16,798. How long do you think you will be in getting to this state of things ?—By the end of the year.

16,799. In the meantime will not the men, in your opinion, suffer ?—I will take care that they do not.

16,800. How will you take care that they do not ?—By pumping in sufficient air.

16,801. How is the pump worked ?—By hand.

16,802. Where is it placed ?—About 40 yards back from where the men are working.

16,803. Is there any communication with the outside air where it is placed now ?—Yes.

16,804. At the point where this hand machine is placed, how near is the communication with the day ?—I do not quite understand the question ; it is 700 yards from the day.

16,805. And this is 40 yards from the pumping ?—Yes.

16,806. Then, I suppose, it is 660 yards from the day where the men are pumping ?—Yes.

16,807. And you are quite satisfied that at that 660 yards the air is perfectly good ?—Yes ; it is at the bottom of our main intake.

16,808. Has it any communication perpendicularly?—No, not at that point.

16,809. Where is the nearest perpendicular communication in this level ?—We have no perpendicular communication.

16,810. Have you any level driven alongside of that ?—Yes ; up to within 30 yards.

16,811. How soon will your furnace be at work ?—In the course of a month.

16,812. And then you will brattice it ?—Then we shall brattice it if necessary.

16,813. And you would not think that it would then be necessary to have a fan ?—We can very soon see.

16,814. Do you take the men out when you find that the candles will not burn ?—Yes.

16,815. But the candles now when you pump air will burn perfectly ?—Yes, on ordinary days. There are some days when the air is exceedingly slack, and then we take the men out.

16,816. How long in this year have you had to take the men out ?—It has only been going three weeks.

16,817. Have you had to take them out during that time ?—Merely while we put in the boxes.

16,818. You mean the boxes for the air ?—Yes. What I have mentioned is quite an exceptional case ; I never met with the gas before, *i.e.* in these mines, except in small quantities.

16,819. Have you ever been in an iron district before ?—I served my apprenticeship to Mr. Marley who has been examined, and I then had an opportunity of examining Eston regularly.

16,820. Is there anything further which you wish to state ?—Not that I am aware of.

The witness withdrew.

Adjourned to Monday next at Wire Gill Mine.

WIRE GILL MINE.

Monday, 13th October 1862.

PRESENT:

The Right Hon. Lord KINNAIRD, K.T.
NICHOLAS KENDALL, Esq., M.P.
JOHN ST. AUBYN, Esq., M.P.
RICHARD DAVEY, Esq., M.P.
P. H. HOLLAND, Esq.

The Right Hon. Lord KINNAIRD, K.T., in the Chair.

The Commissioners inspected and entered the mine, after which they took the following evidence.

Mr. WILLIAM LEE examined.

WIRE GILL MINE.

Mr. W. Lee.

13 Oct. 1862.

16,821. (*Mr. Kendall.*) Are you an overman of the Wire Gill mine?—Yes.

16,822. Before you were an agent did you work here as a miner?—No, not at this mine.

16,823. But you worked under the same company?—Yes, for 15 years in the mines.

16,824. I wish especially to ask you as to the ventilation of this mine. How long has this mine been working?—Perhaps some nine years.

16,825. To-day we have been into the fore-end of the level. What distance is that fore-end of the level from the entrance here?—Between 600 and 700 fathoms.

16,826. About how far in from the day level is it before you come to a shaft which communicates with the surface?—265 fathoms.

16,827. Is that an upcast shaft generally?—Yes, generally speaking.

16,828. Does it ever become a downcast shaft?—Occasionally.

16,829. But seldom?—In the summer season, perhaps.

16,830. In what months of the year does that occur?—In the latter part of July as much as any time.

16,831. You use a great deal of powder, do you not?—Yes.

16,832. You blast all?—Not all.

16,833. Nearly all?—There has been a time when we did not blast so much as we do now.

16,834. In the latter end of July, when it becomes a downcast shaft, where does the powder smoke go?—Out of the level mouth.

16,835. Then, as you are blasting all day, you must have a continued flow of smoke out through the level?—Yes.

16,836. Do the men suffer much going into the level at that time?—I think not. They do a little, but when the smoke has come that distance the bad effects are partly gone.

16,837. It having been scattered through such a distance?—Yes.

16,838. How long does it take to come through that level?—Eight or ten minutes.

16,839. How long is it from the before-mentioned shaft before you come to another shaft?—Perhaps it would be some 80 fathoms.

16,840. How is your ventilation generally carried on in the different workings?—The principal ventilation is by day shafts from the surface, and from open levels at a higher random communicating with the level at the lower random.

16,841. The communication being from one random to the other, and there being every now and then a communication with the surface?—Yes.

16,842. In your experience does that create a sufficient ventilation for the men?—Yes.

16,843. How do you manage when your fore-head is a long way off from the last air point?—We place a water blast so as to throw air into the fore-head.

16,844. Have you a water blast now in your fore-head?—We have a water blast in the levels where you have been, which is 120 fathoms back from the forehead, and air is forced by the blast in pipes to within about a fathom of the fore-head.

16,845. Your fore-head is 120 fathoms from any air communication?—Yes.

16,846. And the whole of that supply of air is driven by a water blast?—Yes.

16,847. How many men work there at a time?—Two.

16,848. How long does the powder smoke lie there?—It is rather difficult to speak positively about that; perhaps we throw in nearly 100 cubic feet of air in a minute.

16,849. How long is it before the men enter again?—Ten minutes or a quarter of an hour; they are not tied; it is at their own discretion.

16,850. Do they go in too soon?—I do not think that they are apt to go in too soon. They seem to have a regard for their health, and a knowledge of what is beneficial to their health.

16,851. Are they a more careful body of men than they used to be?—Yes, much more. They are much more careful since I commenced working in the mine as a miner.

16,852. What is the level for?—One object is to communicate with the level from the adjoining mine.

16,853. What is it called?—Little Eggleshope mine.

16,854. Have you a jet of water there?—Yes.

16,855. What is the difference between the two points?—130 fathoms.

16,856. How long will it be before you communicate?—A twelvemonth.

16,857. You will have no communication with the surface before that?—We have not arranged to have it. If we find our blast sufficient we go through without any other communication.

16,858. Do you think that the blast will be sufficient?—I think that it will be perfectly sufficient.

16,859. How many men are there working at each end?—Eight at each end, two to be in each eight hours at a time; their time is specified as eight hours; they are not exactly tied to that; they may make it shorter; the men get something like seven hours each, taking it in that rotation, for the week; we cannot get the 40 hours in those leading places. If you take the time from Sunday to Sunday we cannot get 40 hours in a week, so that the average time may be taken at something like seven hours.

16,860. (*Chairman.*) Will you state why?—Because there is not time between; two men commence, and during the time for four sets of men there are not so many hours as that they can get in the whole time, and we allow our men to be at home on the Saturday night, so as not to interfere with the Sabbath, and not to leave their homes till the Sunday has gone.

16,861. When the one pair go out do the others go in?—Yes.

16,862. How soon afterwards?—Perhaps those who are in may come out to the mine shop, and the others will go into their place, or if they are a little longer than the time, these may leave the mine shop and change with them, or they may meet on the way.

16,863. Do they work night shifts?—Yes, in this case; they must. As a general rule, they change at the place, but has to give time for the fore-head being cleared of smoke by the blast, we require eight hours where it is practicable.

16,864. (*Mr. Kendall.*) According to your calcula-

WIRE GILL MINE.

Mr. W. Lee.

13 Oct. 1862.

tion, how long do you think that you will be in communicating from one mine to the other?—Twelve months, according to the best of my judgment.

16,865. From your experience, as far as it has gone here, do you think that you will be able to give these men by the water blast a sufficient quantity of air to work there with safety?—Yes.

16,866. Do you think that you shall be able to keep up pretty nearly as good air as we had to-day?—Pretty nearly; we shall lose a little with the friction of the pipe.

16,867. You have sufficient fall and sufficient water in order to increase the power, if necessary?—Yes.

16,868. You have no doubt that the men can work there without injury to their health until the communication is made?—Yes, so far as the air goes; there will be a little injury from the smoke and the dust, and we cannot prevent the fume which arises from the candle.

16,869. Do they suffer much from the dust?—Not so very much; they do a little; for instance, at the commencement of the boring operations they must suffer a little from the dust, and they must suffer from the fume.

16,870. To-day we tried the thermometer, and it was 60° in the end; have you ever had it tried before?—We do not do much in that way.

16,871. Generally speaking, is it much the same as to-day?—Yes, much the same.

16,872. Winter and summer?—Yes; there is not much change in it.

16,873. The men do not complain of heat or of cold?—No, the temperature is very much the same.

16,874. (*Chairman.*) In your opinion you will be able to supply sufficient air, but if not, you might join with the upper level?—If we found it not sufficient we could do that; but I have no doubt that what we are doing now will be sufficient.

16,875. What distance would it be to join with the upper level?—Perhaps about 20 fathoms.

16,876. In driving a rise, how do you supply the air?—In a similar way; we have a blast, and we take a column of pipes up to the rise top, to where the men are working. We divide the rise with a partition.

16,877. Would that sized pipe be sufficient to supply air for the rise as well as for the end?—Yes.

16,878. (*Mr. Kendall.*) You do not at all anticipate going to the surface?—No; we have no reason to think but what we can throw sufficient air into the place otherwise.

16,879. (*Chairman.*) When you rise, you turn the iron pipe up and carry it up as the men go on?—Yes, we have an angular pipe or a circular pipe.

16,880. To enable you to take it up the rise?—Yes.

16,881. What precautions do you take against the pipe being filled up while the men are working?—We have what we call a cap to the pipe, which is on when they fire a shot, and if anything comes down we have an opening at right angles, and so we can let it out.

16,882. You depend entirely upon the men putting that cap on?—Yes; when they are working for a blast they can take it off altogether.

16,883. In winter, when the water freezes, what do you do?—We sometimes cover our watercourses over.

16,884. But the water does freeze sometimes?—It is very rare that we are ever stopped in winter.

16,885. Supposing it to be frozen, what should you do?—Of course we could not have water; but we protect ourselves against that. We cover our watercourses with wood, and the water comes away; and supposing it is frozen over, a spring underneath will come through. We have men to look after it.

16,886. You are never obliged to stop working owing to the water freezing and not being able to supply the blast?—That very rarely occurs, but occasionally it may occur, and in that case we should temporarily remove our men.

16,887. You say that the men suffer from the dust; is that merely stone dust or lead dust?—Not so much from the lead dust; the principal dust from which they suffer is stone dust; there may be a little of the other as well, but its own weight makes it fall more rapidly than stone dust.

16,888. (*Mr. Holland.*) You have said that sometimes the shaft becomes a downcast?—Yes.

16,889. Is your draught as good then as when it is the upcast?—There is a tolerably good draught then.

16,890. How long was your air pipe when you first began using the water blast?—Perhaps 10 fathoms.

16,891. How long is it now?—120.

16,892. Is the blast much weaker now than it was at first?—It is a little weaker; there is the friction that the air has to contend with.

16,893. Is there any considerable leakage, in your opinion, from the pipe?—Not much of that; we look after that.

16,894. Is it very much weaker, or only a little weaker?—Just a little.

16,895. Then you may carry it another 100 fathoms?—We have driven with a blast similar to this, I believe, 600 fathoms.

16,896. With the same fall of water?—Yes.

16,897. And a good blast?—A tolerable blast.

16,898. Have you measured the quantity of air driven and of water flowing?—Perhaps 18 gallons of water a minute.

16,899. How much air?—From 90 to 100 cubic feet may flow in a minute.

16,900. Have you measured that?—We have measured another one, and it was 103 cubic feet; it is on the same principle, and I think that this would be a little less, say 95 cubic feet.

16,901. You have said that as far as the air goes the blast does very well, but that there are powder smoke, candle smoke, and dust?—Yes.

16,902. Do you mean that there are more of those annoyances than in the ordinary workings?—There is a little more in the leading fore-heads than in the open workings.

16,903. Is that because it is more confined, or because the ventilation is worse?—It is more confined.

16,904. Do you attribute the greater annoyance of powder smoke, candle smoke, and dust in the headway to the confined space, or to some little deficiency of ventilation?—It is principally from the confined space.

16,905. Were those men whom we saw in the mine fair specimens of your miners?—Yes.

16,906. They were not more healthy than the rest?—There is not much difference; they were a fair specimen; they are a little younger than some men.

16,907. (*Mr. Kendall.*) But the men whom you had there to-day were men in the regular turn?—Yes; this is a distant mine, and we let the younger men come here on account of the distance, and we keep the older men nearer home, so that they may have less travelling.

16,908. (*Mr. Davey.*) Have you any lodging houses connected with this mine?—Yes.

16,909. How many men occupy them generally?—Perhaps in the shop which you have seen there may be some 80 or 84 men; there is another lodging house as well.

16,910. How many of those men sleep in one room?—That is according to the size of the room; two men sleep in one bed.

The witness withdrew.

Mr. JOSEPH PATTINSON examined.

Mr. J. Pattinson.

16,911. (*Chairman.*) Of which mine have you charge?—Little Eggleshope mine.

16,912. How many men have you there underground?—70; we call them pick men.

16,913. What is about the extreme length of any level which you are driving from the day?—530 fathoms, I think.

16,914. And you are driving now to form a communication with the mine on this side of the hill?—We have a communication already by means of a rise between the two levels, that is to say, the west end of our Little Eggleshope mine and the east end of this (Wire Gill) mine have a communication between the two levels.

16,915. Your men are now driving to form another communication, are they not?—Yes, at a lower level.

16,916. How far have you driven that from any communication with the surface?—In opening up the vein to the extent of 530 fathoms, I believe that in those 530 fathoms we have 13 shafts communicating with the surface.

16,917. How far are you driving from any communication with the surface that level which is to meet the other?—I would say 40 fathoms.

16,918. How is that ventilated?—By means of what we call a pressure blast; a water blast.

16,919. How far do you think that it would be safe to drive with that means of ventilation, in your experience?—It depends upon circumstances; by means of a water blast we have driven as far as 500 fathoms; not with this identical blast, but another blast.

16,920. With what sized pipe did you drive the 500 fathoms?—I cannot say exactly; I should say five or six inches.

16,921. (*Mr. Holland.*) Such a pipe as that which we saw?—Yes; a metal pipe.

16,922. (*Chairman.*) You think that that is quite sufficient?—That is an extreme case; we generally do not drive more than 100 fathoms without a communication.

16,923. But you found this pipe quite sufficient?—Quite sufficient; we have done that.

16,924. Have you taken the same thing up a rise? Yes; we generally rise so far, and sink to meet the rise to get a communication with the surface.

16,925. When you sink or rise do you always apply the pipe?—Yes.

16,926. (*Mr. Holland.*) Is that level always as pure and as fresh as we found it to-day?—Yes; it is not more than an average to-day.

16,927. It is a fair average?—It is a fair specimen.

16,928. (*Chairman.*) Have you always plenty of water to work the water blast?—We have not perhaps sufficient always, but we endeavour as far as we possibly can to have sufficient.

16,929. Does it run short in summer?—Not often; they are generally ever-running springs.

16,930. But it does sometimes run short?—A little.

16,931. In winter does not it sometimes freeze?—We try to prevent its freezing; we cover it over.

16,932. But it does freeze sometimes, does it not?—Not often.

16,933. (*Mr. Holland.*) Is it stopped by frost sometimes?—I do not know that it is; we cover it over and have a close conduit, so that the frost cannot affect it.

16,934. How long have you been a miner?—I have been connected with mines, as a working man and in the capacity that I am now in, 45 or 46 years. I went underground at 14. I was for 22 years a pick man, and I have been nearly 24 years an agent.

16,935. Are you convinced that much more attention is paid to ventilation now than was paid to it when you began?—There is no comparison; the mine is not like the same sort of work.

16,936. As regards ventilation?—Yes.

16,937. In what other respects has it been much improved?—The water blast has been of great benefit.

16,938. About when was that introduced as a general thing?—As nearly as I can tell, from 35 to 40 years ago.

16,939. Has it become much more general now than it was 20 years ago?—It is quite general now; when I first began as a working man there was no such thing as a water blast in the country.

16,940. Can you drive such a level as we were in to-day without a water blast?—No; except by means of a fan blast.

16,941. A water blast or some other equivalent?—Yes. For a temporary purpose we sometimes make use of the fan blast where we cannot have water.

16,942. Do you consider the water blast where you have a sufficient supply of water one of the best modes of artificial ventilation?—Yes, as far as our experience goes; we have tried the fan blast and the pumping.

16,943. What is the great advantage in the water blast?—The purity of the air. When we have a fan machine it is generalty worked by boys, but the water blast goes perpetually, night and day, weekday and Sunday.

16,944. Can you depend upon the continuance of the water blast more than upon other means?—Yes; it is a certainty.

16,945. Would you prefer a water blast to a fan worked by water?—I think that we should; we have tried both.

16,946. Would a water blast, from its great simplicity, be less likely to get out of order than anything else which you use?—I think so; because it is not so complex as a fan; nothing can be more simple than the working of the water blast.

16,947. Then where you have a sufficient fall and a sufficient quantity of water the water blast would be your favourite?—Yes; and I think that that is the favourite with all.

16,948. Have you considered that the miners have been more healthy since the use of the water blast?—Yes; most decidedly.

16,949. You think that it has kept them in life for some years longer?—I should say so.

16,950. Has it considerably diminished the quantity of dust which the men have to breathe, by driving it away?—I suppose that it must do so; it is taken away just as smoke is taken away.

16,951. Has it not diminished the quantity of smoke which they have to breathe more than the quantity of dust, the smoke being lighter; does that correspond with your observation?—I think that it does; excepting where we have shale we have very little dust; in the shale they work a good deal with the pick, which creates dust.

16,952. Is the dust from the shale light enough to be carried away quickly by the water blast?—A great part of it will fall, but the lighter particles will be taken away by the blast.

16,953. Do you think that miners are a better-conducted body of men than they were in your youth; more steady and more sober?—Yes, decidedly so; they were a great deal more addicted to drinking formerly than they are now; the morals of the people are better generally.

16,954. Are they steady workers?—Yes, they are steady well-behaved men.

16,955. Are they better in those respects than they were in your youth?—Decidedly better; in fact they are under stricter regulations.

16,956. Do they lodge better or worse than they did in your youth?—Decidedly better; and for one reading man among miners when I was a lad there are perhaps 20 now; they have libraries in most of the villages, and there are in some of them reading rooms at the masters' expense, and we generally have books at the mine shops as well, such as the British Workman and Chambers' Journal occasionally. Bibles also are supplied to all the mine shops by the masters.

The witness withdrew.

Mr. Mark Pinkney examined.

Wire Gill Mine.

Mr. M. Pinkney.

13 Oct. 1862.

16,957. (*Mr. Davey.*) What situation do you hold in this mine ?—Engineer.

16,958. Have you measured the rooms at the lodging houses ?—I have measured the two which you requested should be measured.

16,959. Will you give the measurement of those two rooms ?—They are rather peculiarly formed. There is a slight plan of them (*producing the same*). The length of one room is 16 feet 8 inches by 15 feet 3 inches. The height of the side wall is 8 feet, and the height to the ridge 13 feet 4 inches.

16,960. How many beds are there in that room ?—There are 10 bedsteads standing there ; there is provision for 10 beds. I cannot say whether the beds are all occupied.

16,961. Those beds are occupied each by two miners ?—Yes, when they are occupied, that is the usual practice.

16,962. Is it the case that they sometimes occupy them by day as well as by night ?—Some of them do ; I cannot say which of them do ; that is an exception ; there is a very small number that occupy them by day.

16,963. But do they occupy the same beds as have been occupied in the night ?—I cannot say ; the mine agent would be the proper party to give you that information. I am not acquainted with that point.

16,964. Will you give the measurement of the other room ?—The other room is 10 feet by 13 feet 2 inches.

16,965. And what is the height ?—It is what we locally term a T fall, it is 7 feet 6 inches in height on one side, and 2 feet 3 inches on the other.

16,966. How many beds have you in that room ?—Three.

16,967. (*Chairman.*) You have taken the measurement ?—Yes.

16,968. Is the ceiling plastered below the slate ?—No, it is open to the slate in the large room, and there is a ventilator on the top as well. The small or T fall room is boarded beneath the slates.

The witness withdrew.

Mr. William Lee further examined.

Mr. W. Lee.

16,969. (*Mr. Davey.*) We have the dimensions of the rooms now ; one room contains 10 beds, how many have you ever known sleep in that room at one time ?—I cannot say ; if all the beds were occupied there would be two in each bed.

16,970. That would be 20 men ; have you ever known it to be full ?—No, I do not know what numbers sleep in that room.

16,971. What is the greatest number of beds that you have known to be empty out of that ?—Perhaps they may all be full, I am not prepared to say that they are not.

16,972. I presume that you have some levels working the whole of the time, three shifts ?—Only one.

16,973. In those shifts do the men after a day shift occupy the same bed ?—They have another bed ; of the four men, two are at work and two are out, but they occupy two beds. There are only four men out of the eight there at one time, two are working at one time and two are in the shop.

16,974. What becomes of the other four ?—They do not come from home till these are done. On Monday morning two men come and they commence their work.

16,975. At what hour ?—In the forenoon, at two o'clock, or from that to a later hour, just as is convenient ; those who go in the afternoon change those who went in in the forenoon; these forenoon men come out and rest eight hours, and those four go on in that way till the Thursday morning when they have done their work ; two fresh men come on upon the Thursday morning, and they work from six on the Thursday morning till two in the afternoon, and two other men who have not been to work take their place and work till 10 at night. Those four men get each four eight-hours shifts by 10 o'clock on Saturday night ; they are eight hours at work and eight hours at rest. The first four have done at six o'clock on Thursday morning, and they go away home, and stop at home for a week till the Thursday comes again. That is what we call back end and fore end.

16,976. (*Chairman.*) Then two men never sleep in a bed one after the other ?—It is not the rule to do so, but they might choose to do so ; the rule is that four men have two beds.

16,977. (*Mr. Davey.*) How are the rooms ventilated ?—By ventilators at the top and at the side as well.

16,978. Who has the management of the ventilation ?—I have, under the direction of the Superintendent, Mr. Bainbridge ; we have shop managers as well.

16,979. Do you ever go there in a morning before the men get up or just as they get up ?—I am generally here after they get up ; they rise perhaps at five in the morning.

16,980. Do you ever go into their bed rooms ?—Yes.

16,981. In what state is the air then ?—It is pretty fair.

16,982. Do you ever find the ventilators stopped up ?—They have been, perhaps, stopped up in the winter season.

16,983. But not at this season of the year ?—I think not.

16,984. I saw some to-day stopped up ?—That is the fault of the men.

16,985. (*Chairman.*) Does the air come down and go up, or only go up ?—When the air is not heated in the room it will be a down draught ; the heated air will escape upwards.

16,986. (*Mr. St. Aubyn.*) The number of men allotted to each room would be too large for their health, would it not, if it were not for the perfect ventilation of the apartments ?—Perhaps it might.

16,987. And therefore you have provided a sufficient number of holes for ventilation ?—Yes, such as to make them comfortable.

16,988. But if those holes for ventilation are not used the health of the men must suffer ?—Perhaps it may a little ; but they generally are used.

16,989. The Commissioners to-day observed that most of the side holes for ventilation were filled up with heather and straw ?—I observed one or two in that way.

16,990. Who is responsible for that ?—The manager of the shop ; there are two men appointed to look after all these things ; they take the management of the shop, and we assist them.

The witness withdrew.

Jonathan Morton examined.

J. Morton.

16,991. (*Chairman.*) How long have you been a miner ?—Thirty-eight years.

16,992. (*Mr. Kendall.*) What age are you now ?—Fifty-four.

16,993. Are you a working miner now or not ?—No, I am not at present.

16,994. Why are you not a working miner now ?—I have been out of health about 22 weeks.

16,995. (*Chairman.*) How are you affected so as to be off work ?—It is in my chest.

16,996. Have you been to the doctor ?—Yes.

16,997. What does he say that it is ?—He says it is

a weakness in my chest. I started with an inflammation in my chest, but it has left a weakness in my chest.

16,998. Did you ever suffer in your breathing before ?—Yes ; I was affected in my breathing, but not in a great measure.

16,999. At what age were you first affected ?—About four or five years ago.

17,000. But you were not laid off work then ?—No.

17,001. You were not laid off work till the inflammation in your chest ?—No.

17,002. Did the doctor say how it arose ?—I think that it arose by cold.

17,003. Did he say that it was in consequence of your having been affected in your breathing before ?—No, he did not say anything of the sort.

17,004. Do you think that the affection of your breathing was brought on by any work that you were engaged in ?—Yes, in a measure.

17,005. What was the cause ?—I think that it was affected by the stour ; that is to say, the dust.

17,006. In what mine were you then working ?—At Hudshope Head and Steer's mines.

17,007. Are they both the Lead Company's mines ?—Yes ; I wrought under no one else.

17,008. What was the description of work that you were engaged in there ?—Driving in levels.

17,009. Was the stour worse where you were driving a level ?—Yes.

17,010. What were you driving through ?—Plate.

17,011. Were there any artificial means of ventilation used ?—Yes, a water engine.

17,012. Was the air quite good ?—Quite good ; it was quite clear, good air, and it cleared the reek well.

WIRE GILL MINE.
J. Morton.
13 Oct. 1862.

17,013. How long was it before the reek was cleared ?—It might be about a quarter of an hour, and then it was clear.

17,014. But it did not get rid of the stour ?—No.

17,015. Was it very dry ?—Yes, quite dry.

17,016. How long were you working in that before you felt anything ?—I wrought in that level four years.

17,017. And at the end of four years was that the first time that you felt it ?—No, I did not feel it for a good bit after that.

17,018. You do not know where it was that you first felt the affection ?—No.

17,019. Did it destroy your appetite ?—Yes, it took away my appetite.

17,020. Do you think that you swallowed the dust in the stomach, or that it went into the lungs ?—I think that it went into my stomach.

17,021. Did you give it out much ?—No ; I do not smoke, and never did.

17,022. Was your mouth full of dust ?—Yes.

17,023. (*Mr. Davey.*) Did you suffer before you had this attack of inflammation of the lungs ?—No.

17,024. You never felt any inconvenience from working in those close ends ?—Never.

17,025. And the doctor did not tell you that it arose from that ?—He told me that it was weakness, from the effects of mining.

The witness withdrew.

Adjourned.

REETH.

Tuesday, 3rd March 1863.

PRESENT :

The Right Hon. Lord KINNAIRD, K.T.
NICHOLAS KENDALL, Esq., M.P.
Sir PHILIP GREY EGERTON, Bart., M.P.
The Hon. F. LEVESON GOWER, M.P.
P. H. HOLLAND, Esq.

The Right Hon. Lord KINNAIRD, K.T., in the Chair.

Mr. ADAM BARKER examined.

17,026. (*Chairman.*) Of what mines are you agent ?—Whitarside Mine and Summer Lodge Mine.

17,027. Are those both in the neighbourhood of Reeth ?—Yes.

17,028. How many men have you employed in the two mines ?—On the average for the last six years we have had about 15 on Whitarside Mine. The other mine only began in last October, a year last October, and there have been four men employed there. They are only driving a level.

17,029. Have you ever had charge of any other mines besides these ?—No.

17,030. Have you ever worked as a miner yourself ?—Yes, all my lifetime, till I came to be agent of these places.

17,031. In what mines have you worked ?—I have worked in the Surrender mines a long time.

17,032. Did you work by the bing or by the fathom ?—Fathom-work and fother-tail ; fother-tail it was in those days, 25 cwt. went to the fother, delivered at the mill in lead.

17,033. Have you ever worked in those mines in bad air ?—Yes, I have.

17,034. Do you mean want of air or carbonic acid gas ?—We wanted fresh air.

17,035. How did you find the want of that ; by your your own feelings or by the candle ?—By the candle chiefly.

17,036. Could you tell the want of air yourself without trusting to the candle ?—Yes, I could. It was a very hard place that I was working in at Surrender, a place called North Vein. It was about some three or four feet wide between the sides and nothing but vein, with the exception of a little ore, of about half an inch wide, which struck up and down, and we had that to hew out, and then we had to bore a hole in the vein to shut that off to make our dirkway, and it was done by craft, one man having a better idea than another in it. Some men used to come into that place that could not make the picks penetrate it, and it caused a dust to blow about a good deal ; and some men used to come out of that place with their whiskers and their hair as if they had been powdered. Strong muscular men without craft could not do it at all, and some men would fetch it off every time they struck by craft.

REETH
Mr. A. Barker.
3 March 1863.

17,037. Did you ever know men suffer from working ?—I suffered a great deal from it. When I was about 40 years of age I began to want wind very much.

17,038. Have you got quite over that now ?—No ; I never shall get over it.

17,039. Do you attribute it entirely to working in that one place ?—I attribute it to nothing else but that very place.

17,040. Were there any means taken to improve the ventilation when you were working there ?—Yes.

17,041. What means ?—Rising up to get to another place that we could come to above, an old drift.

17,042. But till that was done were any artificial means used ?—Not any.

17,043. Why was the air so bad in that end ?—For

REETH.

Mr. A. Barker.

3 March 1863.

want of ventilation; another opening to bring us fresh air to it.

17,044. Then some artificial mode was necessary to bring the air till you got the rise driven?—We had none. We had no communication whatever with any other place to get a draught.

17,045. You had no fan or other mode?—We had no fan in that place.

17,046. How long ago is this?—It would be 30 years back. It is 29 years since I commenced it, I believe. I was in it four years. Lead was very low, and wages 7*s*., 8*s*., and 9*s*. a week only.

17,047. Was not the system of having a fan worked by a boy in use at that time?—Yes; but we had not one there. It was a long way from the shafts; it was at the east end of the field.

17,048. Do you suppose that anybody would now attempt to drive an end without having some artificial means of ventilation?—No; they have quite a different mode altogether of working.

17,049. At that time was there a low horse level, or did you descend by shaft?—We descended by shaft. Nearly all of the workings at Surrender were by shaft. Mr. Robinson got possession of Surrender mines and put up a level out of Arkendale, and they holed to the very level that I am speaking of.

17,050. Does the opening up of that level give sufficient ventilation without any artificial means?—Yes, I think so. It has been very beneficial.

17,051. Would it be sufficient to drive a rise on the forehead without any artificial ventilation?—No; it could not be done for a very long distance. The furthest that I ever knew was at Whiterside; we drove about 350 fathoms, and we had a single air place—a single rise that gave us fresh air; and after that we drove about 200 fathoms in the vein, and then we put up a rise 27 fathoms in grit and plate.

17,052. Have you now ventilation completely at the end?—We are out at the surface at that place by rising.

17,053. In driving in a maiden or new mine you are subject to the want of sufficient air?—Certainly.

17,054. More, perhaps, than in an old mine which has a horse level?—Quite so.

17,055. What means do you adopt in the mine of which you have charge where you are driving beyond a rise?—We put up a rise to give us air.

17,056. But if you wanted to drive beyond the rise what means would you adopt for ventilation?—We should adopt a machine what is called a windy king, that is a fan with a boy to drive it.

17,057. Is that quite sufficient?—Yes, it answers very well in general. We did not use that in our place. I drove a very good level, and I got a door made to fit the end of my waggon, such a one as I never saw tried before in any mines, and I never heard of it. I named it to Mr. Robinson, of Richmond, and I had it attached to the waggon. It was a very good level, and the men carried it with that velocity that it drove a current of fresh air which it carried into the forehead.

17,058. (*Mr. Holland.*) How did the air get out?—I do not know how it came, but they always had plenty of air.

17,059. (*Chairman.*) I suppose that this board did not fit close to the sides?—It did not. They came back with the same velocity. It answered beautifully; it is a most excellent thing. Mr. Robinson admired it.

17,060. I suppose that you could always put it to a certain extent; that is to say, a solid screen in the front of the waggon of the proper size, and that would be an advantage?—Yes.

17,061. Was this straight or were there any curves?—There was very little curve indeed.

17,062. (*Mr. Holland.*) You said a little while ago that there was a great deal of dust in the level where you were working 30 years ago; that the men had not craft enough to bring the ore down without making a great deal of dust?—I did; some men had no craft.

17,063. Was that dust very distressing to you?—Yes; it was very pernicious and very heavy.

17,064. Did it distress you very much?—Yes, sometimes it did.

17,065. Do you attribute much of the illness which you suffered then to the dust or to the close air?—The illness is the want of more breath; I found it out when I was 40 years of age. I cannot say that I felt anything. I was then about 24 years of age, just in what you may call the prime of life, and what I used to think was about as beneficial as anything for me was a piece of fat beef, fat mutton, or bacon.

17,066. I understood you to say that you got an illness 30 years ago from which you have not recovered yet?—Certainly I did; I only wanted more breath.

17,067. What do you think was the cause of that illness?—Nothing but the dust from this very vein.

17,068. The dust or the bad air?—Both combined. I had bad air and I had this dust to contend with.

17,069. Is much more attention paid to ventilation now than there was 30 years ago?—A very great deal.

17,070. Are the men more healthy than they were when you were a boy?—I believe that they are healthier in general. In fact a mine is nothing now to what it was when I was a boy.

17,071. Your fellow workmen now are more healthy than they were 30 years ago?—Yes.

17,072. Are you sure of that?—Yes; I am certain of it.

17,073. (*Mr. Leveson Gower.*) At what age did you begin working?—14.

17,074. What is the youngest age at which boys work now in the mines?—I believe that they do not do anything in the mines in a general way till they are about 10 years old.

17,075. Do they work underground at 10 years old?—Yes, some few. These cases happen where there is a strong man, and he has a strong robust sort of boy, and he gets the boy out in order to make his earnings rather more. His father takes him along with him.

17,076. There has been no change as to the age at which they go into the mines?—No; I do not know that there has been any change in that way. When I was a boy, boys had to carry their work a very long way to the bottom of a shaft with their feet in clay, with the trapping on, and a bucket behind them, and they had the skin off their shoulders and other places. The trapping was made of leather. They now go in, and they have what are called dirks and iron rails; they had wooden rails at that time, and it is three times as easy work for boys at the present day as it was at that time; and the mines, in a general way, are far better ventilated than they were 30 years ago.

17,077. Have boys who begin so early now any opportunity of going to school?—The fathers could not afford to allow the boys to go to school longer than that time.

17,078. When they begin working they leave off going to school?—They do.

17,079. How do the boys get up and down the stemples?—They are assisted by their fathers; the father guides their feet. I have done that myself many a time when I had charge of boys.

17,080. Do you remember any accident to boys going up the stemples?—Yes, I remember one; a boy who tumbled down a place at Surrender, and he died from it.

17,081. Is that the only accident which you remember happening to a boy?—No, there was another, a little boy with his father. He slipped past him at Surrender New shaft. That may be about five years ago.

17,082. Do you remember any other cases?—I do not remember any other cases. These are things which I have never looked at in that shape. I think that I have heard my father tell of a boy at the same shaft tumbling past his father.

17,083. (*Mr. Holland.*) Were all those boys killed?

—Yes; and I remember very well catching a boy of about my age. Three of us were coming up at Surrender mines and we had got near to the top and he slipped, and he said "Ho!" I had him upon my shoulders.

17,084. (*Mr. Leveson Gower.*) Do the fathers ever take any precaution to prevent the boys falling?—Yes.

17,085. What precaution?—They have had them strapped to their bodies. They get these little boys into the waggons to ride up the level if they possibly can.

17,086. Do the boys usually go up the stemples?—Yes; but they let them down by rope where a rope is on.

17,087. I thought you said that they guided their feet?—Yes, they do, when climbing.

17,088. (*Sir Philip Egerton.*) When you come to any hard material now, such as you have described in Surrender mine, do you still work it by craft or by wedges, or by blasting?—It is forced to be worked by craft; we cannot do it otherwise.

17,089. You cannot get the shots bored?—We cannot get the shots to work so well without they have liberty.

17,090. But the ventilation is provided for now, whereas it was was not provided for heretofore?—It is a great deal better provided.

17,091. (*Mr. Kendall.*) What is your age?—I am 55.

17,092. Do you go underground now much as agent?—Yes, I go when I am wanted, occasionally.

17,093. How often do you go underground upon the average?—I should say about two or three times a week.

17,094. Do you go up and down these stemples much?—No; we have not much stemple work where I am at the present time.

17,095. Taking the mines on the average in this neighbourhood, have you improved in the mode of ascent and descent as to the stemples; have you any other mode now, or do you still use stemples?—I believe that in some places here they have ladders.

17,096. Do you consider them an improvement upon the stemples?—I do not consider them any improvement at all.

17,097. Do you know any bad ends in any mines in this neighbourhood at the present moment; any place where the air is bad?—No, I cannot name one.

17,098. Do you see more old miners now walking about than you did in your younger days?—Yes, I think that there are.

17,099. They live longer?—Yes.

17,100. What is the average number of hours that they work a day?—I cannot speak to that in all mines.

17,101. Take your own mine; how many hours in a day do your men work?—They work here from six to seven hours, in a general way, I believe.

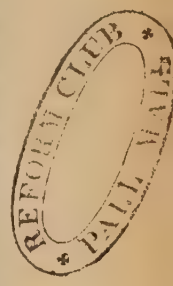
17,102. Underground do your men average six hours?—I am quite certain that they do.

17,103. In your younger days did they average more?—No; in my time they did not work more than about three or four hours; if they stayed six or seven hours it was considered two days work or shifts in a general way when I was young.

17,104. Was that because the men did not like to work so much as they do now, or because the air was bad?—It was the custom.

17,105. It was not because the air was bad?—No, I do not know that it was.

17,106. (*Mr Holland.*) How many days a week do you work?—Six.



The witness withdrew.

Mr. JOHN RICHARD MCCOLLAH examined.

17,107. (*Chairman.*) Have you been engaged long as a medical practitioner in this district?—I have been here 28 years.

17,108. You attend the union I believe?—I do.

17,109. Are there many old miners in the union; meaning the house?—No, there are not at the present time.

17,110. What parishes compose the union?—Reeth, Muker, Melbecks, Grinton, Marrick, and Ellerton Abbey.

17,111. Are there mines in most of these parishes?—In all of them.

17,112. Have you an opportunity of examining many cases where the men are what is termed broken-winded?—I have attended very great numbers of them.

17,113. Have you ever had a post-mortem examination?—Not in cases of that kind.

17,114. Do the miners come to you in the earlier stages of the affection?—They very frequently do.

17,115. Do you know cases where you have been able to effect a cure in the earlier stages?—Yes; it generally begins as chronic bronchitis.

17,116. But the men continue to work at the mines, and still may get over it?—I generally caution them against working in mines which are ill ventilated; the lead miners call it working in a windless groove; I caution them against that when I see that there is any affection of the breathing.

17,117. On a miner coming to you do you inquire as to the place in which he is working?—Yes, that is generally the first question I ask.

17,118. Do you ever yourself go underground?—No.

17,119. Can you point out many cases now where men are affected and still are working on in mines?—Yes.

17,120. Do you suppose that they die earlier from this affection?—There is no doubt of it.

17,121. At what age should you say generally that miners so affected die?—Very few of the lead miners are able to work after they are 50 years of age.

17,122. Do you think that from going early to work as boys they are more liable to be affected, or that they become acclimatized to it?—There is no doubt that they are more liable to be affected by going into the mines very young, because the exciting cause is going on in youth just in the same way as it is in mature age.

17,123. Is there anything besides the want of air in working in the mines which you think injurious to the men?—I am not aware that there are any noxious gases to which the men can be exposed.

17,124. Do they suffer at all from the dust?—Yes.

17,125. Have you ever examined any of the sputa to see the dust?—Yes.

17,126. Is that dust injurious from being merely the dust of the grit, or from having particles of lead in it?—I think it is merely from the dust.

17,127. Do you think that the water is at all impregnated with lead?—I do not think it is.

17,128. Then you think that the injury is not owing to the ore, but that it arises from the dust?—From the dust and from an insufficient supply of atmospheric air in many cases.

17,129. (*Mr. Holland.*) You have said that you have practised 28 years?—I have.

17,130. Have you noticed any improvement in the health of the miners in that time?—Yes.

17,131. Is it marked?—Yes. In some parts of the district in which I have practised, scrofulous disease used to prevail to a very serious extent.

17,132. Was that among the children?—Children and grown-up people too; and I can see a marked improvement in the constitutions of the people in that locality since I commenced practice.

17,133. To what do you attribute that change?—I should say to a better mode of living; better diet.

17,134. Have their habitations been much im-

REETH.

Mr. J. R. McCollah.

3 March 1863.

proved?—Yes, their habitations have been a good deal improved too.

17,135. Have you noticed any marked change in their habits of cleanliness?—No, I cannot say that I have; the people in this part of the country are generally a very cleanly people.

17,136. And they were 28 years ago as cleanly, were they?—Yes.

17,137. Is their sleeping accommodation much better than it was?—It is.

17,138. Very decidedly better?—I think it is very much improved.

17,139. You feel satisfied that there is a diminution in scrofulous disease, do you?—Yes.

17,140. Is there decidedly less of the peculiar miners' disease now than there was 20 or 30 years ago?—I think that there is a diminution of it.

17,141. But you are satisfied that there is a peculiar disease among the miners?—Yes.

17,142. A well recognised form of lung disease?—Yes; this I believe is entailed upon them by working in the mines entirely.

17,143. And which you do not see among any other people but miners?—No. Of course where there is a tendency to tuberculous disease, where there is a tuberculous constitution, in those kind of cases it generally ends in consumption; but in the common run of cases it ends in miners' asthma.

17,144. At what age does miners' asthma generally show itself?—At different ages; I have seen men from 26 to 30 years of age badly affected with that disease; but sometimes it will not show itself as a permanent affection till a man is between 50 and 60.

17,145. Does it frequently first show itself after 30?—Yes it does.

17,146. Does it come on very slowly?—Sometimes it does and sometimes it does not; sometimes it comes on in a very chronic form, with a little cough and expectoration, and the man perseveres in going to work; if he happens to be working in a place which is not particularly well ventilated, the affection continues until he is obliged to discontinue work.

17,147. It may go on for many years before it lays him up?—Yes, it may.

17,148. Does it frequently begin like a cold?—It does.

17,149. From which the man recovers?—Yes; it begins just as a case of common bronchitis.

17,150. Do you agree with the evidence which has been given to the Commission, that it is to a great extent produced by a succession of colds; have you observed that. Some medical men think they have observed that it has been produced by a succession of colds, to which they think that miners are liable, more liable than other men; does that correspond with your observation?—Yes.

17,151. Have you noticed whether men who work in the grit rock suffer more or not from the dust than those who work in the limestone rock?—I believe they do; they generally complain of suffering more in working what the miners call the plate.

17,152. I suppose that the true miners' asthma is quite a distinct disease from consumption, is it not?—Entirely so.

17,153. Does it very closely resemble ordinary chronic bronchitis?—It resembles ordinary asthma.

17,154. (*Mr. Leveson Gower.*) What is the earliest age at which you have seen this miners' asthma?—I cannot positively say as to that.

17,155. Are boys affected by it?—No; they frequently die from bronchitis.

17,156. Which is caused by working in the mines?—Which is caused by working in badly ventilated parts of the mines.

17,157. It never gets to miners' asthma at that early age?—No.

17,158. But you believe that the seeds of the disease are formed?—There is no doubt of it.

17,159. (*Mr. Holland.*) The early cases would probably be acute catarrh?—No; it comes on with coughing and expectoration.

17,160. (*Sir Philip Egerton.*) Is it an inflammatory disease?—Yes.

17,161. Are the membranes affected?—Yes.

17,162. Does it sometimes become tuberculosis?—If there is a consumptive tendency it is very apt to bring on consumption.

17,163. In the opinions which you have given do you include the persons employed in the smelting works as well as those in the mines?—I see less disease of that kind amongst the smelters than amongst those working in the lead mines.

17,164. But in the evidence which you have given do you include those who are employed in the smelting works as well as the miners?—Yes.

17,165. Is the disease common to both?—It is common to both, but it is not so common to the smelters as it is to the lead miners.

17,166. Are the smelters exposed to dust, which you say to a great extent causes miners' asthma?—No, they are not.

17,167. Then how can you account for their having the disease?—The construction of the smelting mills is now very much improved, and the ventilation quite superior to what it was thirty years ago; consequently you rarely see the disease amongst young men working in the smelting mills, whilst among the older men it is a common complaint.

17,168. I understood you to say that the dust had a considerable effect in producing this disease?—It has.

17,169. But the smelters are not exposed to dust?—They are not exposed to dust, because the smelting mills are generally well ventilated.

17,170. But still they are subject to miners' asthma?—They are.

17,171. Do you think that climatal causes have anything to do with this disease?—No.

17,172. Then I cannot understand how you account for the smelters being subject to the miners' asthma, although they are not exposed to those influences which you say induce it in the miners?—You occasionally see it among the smelters, but not nearly so frequently as among the men who have to work under ground.

17,173. Do you suppose that it is infectious or contagious?—Not at all.

17,174. Are the smelters exposed to any noxious vapours from the operations which they conduct?—Not that I am aware of.

17,175. You have no cases of lead poisoning?—I have often thought that there is a possibility that they might suffer from absorption by wearing their flannels too much without washing. Indeed, I believe that the lead miners themselves do not attend sufficiently to the bath. I think that if they were to have a bath once or twice a week to cleanse the pores of the skin, they would suffer less from bronchial disease.

17,176. Do you find any diseases peculiar to the smelters?—No, not here; I never remember having seen more than two cases of paralysis which I attributed to smelting.

17,177. (*Mr. Holland.*) Lead paralysis?—Lead paralysis.

17,178. (*Sir Philip Egerton.*) As a whole you think that the smelters are a more healthy set of people than the miners?—Yes.

17,179. (*Mr. Kendall.*) Do you think that miners' asthma now is as prevalent as it was when you first commenced practice 28 years ago?—I do not think it is.

17,180. Is there a very sensible diminution in it?—There is.

17,181. That you attribute to better ventilation I suppose?—I do.

17,182. Have you ever made a post mortem examination of any of the miners who have died from the miners' disease?—No.

17,183. I suppose there is an objection to it?—They will not allow it here.

17,184. But still your impression is that the disease is different from tubercular disease?—Yes, decidedly.

17,185. With regard to the dust; you have never seen men working underground?—I was never but once in a lead mine.

17,186. You have never seen the dust?—No.

17,187. And you have never seen any expectoration?—I have, frequently.

17,188. There is no mark in it at all?—No.

17,189. Have you ever heard them complain that they suffered more when working in the plate than in the lime or elsewhere?—I have heard them say that they suffer most from working amongst the plate, black plate as they describe it.

17,190. Taking it as a whole, do they say that they suffer more from the air or more from the dust?—They suffer more from the air; from the want of air as I understand them.

17,191. Is the air in plate worse, or have you ever heard that there is any carbonic acid which comes from plate?—No. I think that there must be carbonic acid, because they say that it is a kind of black damp which they especially believe injures them.

17,192. You fancy from the feeling which the men describe that it is not at all unlikely that carbonic acid gas may arise when they come to plate?—I should think that it is very likely.

17,193. (*Chairman.*) When you say that you have observed the men when they have come to you spitting up black sputa, does that continue for any time?—Yes, it will continue for months together after they have ceased working; it is dark-coloured sputa.

17,194. Have you ever examined that sputa with a microscope?—I have not.

17,195. You say that you advise men when they come to you in the first instance to leave the part in which they are working, have you found that they have done so generally?—Very frequently.

17,196. But I suppose that sometimes they cannot afford to do so?—No; sometimes if they happen to be earning tolerably well, they have a great objection to leave the place, and they continue until their health will no longer admit of it.

17,197. Do they earn more money when they are working in bad places?—I am not aware that they do generally speaking. If they are taking a good quantity of ore, and making what they call pretty good wages, of course they have a great objection to leave it.

17,198. You say that there is a great improvement in the cottages; have you seen the cottages at Hurst?—Yes; there is great improvement there, more especially; during the last 15 years there has been a great improvement.

17,199. In the way of drainage or what?—An improvement in the cottages.

17,200. I believe that there was fever there at one time to a great extent?—Yes; typhus continued there for nearly ten years.

17,201. But you think that since improvements have been made there has been less fever?—I do not think that there have been any cases of typhus there during the last ten years.

17,202. (*Mr. Holland.*) Do the men complain of powder smoke?—Yes.

17,203. Do they complain much of candle smoke?—No.

17,204. Was the black spit, which you spoke of just now, carbonaceous matter?—No.

17,205. What was it?—It was merely common expectoration.

17,206. (*Chairman.*) Do you think that the men suffer at all from the carbonaceous matter arising from the smoke of candles or the blasting of gunpowder?—From the powder very likely they may, but not from the candles.

17,207. (*Mr. Holland.*) Are you satisfied that there is more scrofula here now than in most districts?—I was never in a district in England where there was so much scrofula as there is here, but it is almost entirely confined to one particular locality. At Hurst they are almost exempt from scrofulous disease. Intermarriage it is said has a great effect in producing scrofulous disease. I should say that Hurst must be an exception to that rule, because its inhabitants are nearly all relations; they have intermarried generation after generation, and still you can hardly go among a finer body of men or women than they are, and they are, generally speaking, very healthy.

17,208. And there is no excess of scrofula among the children?—No.

17,209. To what do you attribute the excess of scrofula in the district where you say it is peculiar?—I hardly know what to attribute it to, it may be partly from the limestone water. I believe that formerly in that locality they brought up their children almost entirely on oatmeal; that might have some tendency to lay the foundation of the disease.

17,210. Is that a damper place than the rest?—No.

17,211. Is the bed-room accommodation worse?—No.

The witness withdrew.

Mr. RALPH MILNER examined.

17,212. (*Chairman.*) Of what mines have you charge?—Whiterside and Summer Lodge and Beldihill.

17,213. Are you the underground agent there?—I am a shareholder. I attend underground.

17,214. You are only a shareholder?—I am only a shareholder.

17,215. Then you are not the managing agent?—Mr. Barker is general manager, I am director.

17,216. Have you resided long in this district?—Yes; I have resided all my time in this district.

17,217. Have you had anything to do with other mines besides these?—Yes, with some little concerns, but nothing of any moment; some little bits under Sir George Denys.

17,218. Have you had to do with mines in this district, working them for some time?—Yes, for 40 years or nearly 50.

17,219. Always these same mines?—Yes.

17,220. Any others?—There was Stagsfell, but it is done away with, it was under Lord Wharncliffe.

17,221. Do you know of men suffering at all from working in mines?—Yes; I have seen men suffer. Different veins have different effects upon men.

17,222. What is the effect?—The hard veins they have to hew out with picks and different things and wedges; the stour comes from it wherever it is; let it be ventilated, it still affects the miners a great deal.

17,223. (*Mr. Holland.*) What do you mean by "stour"?—Dust.

17,224. (*Chairman.*) In what description of strata is that, in the lime, or the grit, or the plate?—In all.

17,225. Which do you think is the worst?—I think that the plate is the worst.

17,226. Have you been down a mine when the men have been working in the plate?—Frequently.

17,227. Is it a small dust?—It is a small dust.

17,228. Is there any carbonic acid, do you suppose, in the plate, or anything in the plate besides this dust which is injurious?—There is sometimes sulphur in the plate.

17,229. How do you ascertain that?—There is what we term "catheads."

17,230. (*Mr Holland.*) Is that pyrites?—Yes; it is sometimes sulphur.

17,231. Does it give off a smell?—Yes.

17,232. (*Chairman.*) Ventilation will not get rid of the stour?—It will improve it a great deal, but will not finally do away with it.

17,233. Do the men ever use water in working?—Yes; I have seen water used for boring holes.

REETH.
Mr. R. Milner.
3 March 1863.

17,234. But not by way of getting rid of the stour?—No; I never saw any case of that.

17,235. Have you ever known the men obliged to leave the place from the dust when working in plate?—No; I have seen them working hard, but not give it up; wind has generally got to them by some means, what we call a "windy king."

17,236. Does that completely remove it?—No.

17,237. So that they must inhale a certain portion?—Yes.

17,238. Have you heard the men complain long afterwards of it?—I have heard them complain of spitting out a black stuff.

17,239. (*Mr. Holland.*) You have been acquainted with miners for 50 years, I think, you said?—Yes.

17,240. Have you noticed that their health has altered as a class in those 50 years?—They have improved. There are better way-gates, as we call them, and shafts; formerly they were very little.

17,241. Do you think that the health of the miners has improved?—Yes, no doubt it has, from good levels and shafts being put down.

17,242. Do miners attain a higher age now than they did in your youth?—Yes, I think that they do; but still it takes a good bit off their lives.

17,243. At what age do you consider a miner an old man?—I have known one 84.

17,244. But at what age is a man thought to be an old miner?—At about 50 or 55.

17,245. A small proportion survive that age?—A very small proportion.

17,246. At what age does the health generally begin to fail?—At 30 to 40 years of age.

17,247. Do they then begin to show the miners' asthma?—Yes.

17,248. Is that miners' asthma generally attributed to the stour which you speak of?—I think that it is the dust which comes off the rock which is the cause, in some hardish mines they have to work with the pick and a stour comes off it, even if it is well ventilated, which affects men.

The witness withdrew.

Mr. THOMAS COATES examined.

REETH.
Mr. T. Coates.
3 March 1863.

17,249. (*Chairman.*) Of what mine or mines have you the charge?—Arkindale and Fell End.

17,250. Have you charge of the Old Gang?—I was there when the inspectors were about, but I am not there now; the Old Gang agent is here, and I have brought the Old Gang plan.

17,251. But you have had charge of that mine up to lately?—Yes, up to about a fortnight since.

17,252. Can you tell the number of men employed altogether in each of those mines?—Yes, we have about 200 men and boys altogether in Arkindale.

17,253. How many of those are working under ground?—They are all working under ground.

17,254. Are there any women employed at the surface?—Yes; at the washings, chiefly women; the men's labour is too dear; but nothing like so many women are employed as there used to be; some will not go to the washings at all, they will rather go to service.

17,255. Do they work under cover when they are at the washings?—Some do and some do not. We have some places covered in, but when they are covered in, generally speaking, in winter time, it is too soon dark and too long in getting light in the mornings under sheds, it cuts an hour off either end.

17,256. Therefore it is not profitable to work under sheds on account of the light?—No.

17,257. They have never tried putting glass on the roof?—No.

17,258. At what age do the boys go down?—It just depends upon circumstances; if a goodish man has a lad, and he is badly off, and has a large family and only his own hand labour, we generally let him take him when he will; but we generally like them to be about twelve.

17,259. But still you would not prevent a man if he wanted to take his boy at an earlier age from doing so?—I would not if he was a good man, and I thought that the boy was likely to work for him. It is just for the sake of earning a bit of money; he would get just half wages.

17,260. How many men have you at Fell End?—Six.

17,261. Is that a new or maiden mine?—It is an old mine, but we are going now into maiden ground.

17,262. What is the longest horse level in the Arkindale Mine?—I think about $1\frac{1}{4}$ miles.

17,263. Are there any workings below that level at all?—Yes; we sink down when we have a chance to try the beds.

17,264. How do you get rid of the water in that case?—Sometimes we have none at all, and sometimes we have it to draw.

17,265. How do you draw it?—In tubs which will hold perhaps six gallons.

17,266. And the men wind it up?—Yes.

17,267. How many fathoms have you ever gone down in the Arkindale Mine below the level?—In some mines we have been down below the same level 40 fathoms; there are two levels, one 20 fathoms below the other. Danby level is 20 fathoms below, and Danrigg level is 20 fathoms below Danby level.

17,268. What beds in the district are generally most productive?—The 12-fathom lime; they have all been productive; the under-sets have been very productive in certain places, but the 12-fathom lime is the principal.

17,269. Do you think that by going deeper they will find ore?—They may; but I think that it will never pay here.

17,270. You must then adopt some means to get rid of the water?—Yes; you want a level to carry.

17,271. Are the levels now at the lowest part of the valley?—No; we could get, I should think, 30 fathoms.

17,272. How many shafts direct with the surface have you?—We have none; the Old Man worked them before I was born, and sometimes we rise to those workings and sometimes we sink down to the levels.

17,273. Do you know how many of those are in direct communication with the level?—I can go in at Danby level and come out at Danrigg level, and go in at Danrigg level and come out at another level, and so from one to the other.

17,274. Is there any particular up-cast or down-cast?—We have sunk a shaft at the Foregill level; there is only one.

17,275. Is that an up-cast or a down-cast?—It just changes as the weather changes. If it is going to be droughty weather the air will go out at the mouth, and in wet weather it will be the contrary.

17,276. What is it in very hot weather?—It draws out at the level mouth.

17,277. Then there is a time when the air is stagnant?—Very seldom. I never recollect it when there has been a thoroughfare in that way; there is more in windy weather.

17,278. When you have been driving a forehead, have you been obliged to adopt any artificial means for ventilation?—Yes, we use every means that we can; we have windy kings and water blasts.

17,279. Does the water drive a fan, or does it act as a blast in itself?—We have tried both ways.

17,280. Which do you prefer?—I prefer having both of them together; having a fan inside the water blast, the tub and the air likewise, because the air beats on the top of the fan and carries it. We have tried it two or three times, and I have always found a stronger current when both were going together.

17,281. When you have a windy king you are entirely dependent upon a boy?—Yes.

17,282. What security have you that the boy does not go to sleep, and that he continues to drive the

fan?—We always take the fan close up beside the men, and we suck the air in that case; the boy is sitting within a certain number of fathoms of the men.

17,283. So that the men can then look after the boy?—Yes; I have been a miner myself for about 30 years, and I principally worked in the close fore-heads. I had a good deal to do with these boys, and I have known one put his finger in, being perhaps half asleep, and when we came up to him he was crying out; it was suddenly crushed. This is about 20 years ago. He happened to be at a sumpt; the sumpt was about 15 fathoms; it was rather inconvenient, so that after that we contrived to have the boy beside us, so that if he did not blow we could go and make him blow.

17,284. In your opinion it is better to adopt that mode than to have him several fathoms off at the end?—Yes.

17,285. You say that you have often worked in close fore-heads?—Yes.

17,286. Did you ever suffer from it?—No never. I have worked as a worker, and have worked hard as an agent ever since I was an agent. You caught me yesterday, and I go on so every day.

17,287. What age are you?—53.

17,288. Have you ever known men suffer from working?—Yes, I have known some men that I have worked with 30 years since who died when they were not above 40, and they were working in the same place with me; very likely they were born rather asthmatical.

17,289. Do you think that, if a man was perfectly healthy he would not be affected by working in bad air?—If he worked a long time in bad air I have no doubt that it would affect him and affect his wind; but as the mines are now, generally speaking, I do not think that he would take any harm.

17,290. You think that working by levels has given a better ventilation?—Yes; and they have taken a good deal of hard labour off.

17,291. Is there any place about here that we could see where a candle will not burn?—I do not know of one, if I did I of course would have taken the Inspectors to it; I was never afraid about the Inspectors coming.

17,292. How many men work in a partnership?—Sometimes eight; generally from two to eight; sometimes we may have nine.

17,293. How many hours do they work?—Some three, and some five, and some eight, just as it happens.

17,294. Those are the men who are working by bing?—Yes.

17,295. How is it with the men working by fathoms? They are just in the same way.

17,296. Do you set the bargain?—Yes.

17,297. What deductions are made from the men's pay?—Half a stone of candles a month, and powder, and drawing, and tools.

17,298. For sharpening tools?—No. They pay 3*d.* a lb. for their iron, and we pay the blacksmiths ourselves; they have nothing to pay for that.

17,299. But they pay for the wear and tear of the tools?—Yes.

17,300. Where do you get your candles?—We make them ourselves. I have brought some with me.

17,301. Why do you make them yourselves?—Because we can make them better.

(*The witness produced some candles.*)

17,302. In making the candles do you mix anything with the wicks besides cotton?—There is nothing that I am aware of but the bare cotton.

17,303. You do not think it necessary to mix flax or tow in the wicks?—I think that we cannot put in so good a thing as is in them.

17,304. Have you ever seen a candle the wick of which has been mixed with cotton and tow?—Never in my life.

17,305. (*Mr. Kendall.*) Are the candles made of Russian tallow?—Russian and American; both North and South American, I believe.

17,306. There is no English tallow?—None.

17,307. You charge 8*d.* a pound for the candles?—Yes.

17,308. What does it cost you?—6*d.*, and sometimes a fraction more.*

17,309. Do you limit the men in quantity?—We deliver them out once a week.

17,310. Do you limit them?—Yes, rather, or else they would sell them; we allow them six pounds a month.

17,311. What do they sell at?—They will sell them at 3*s.* and 4*s.*

17,312. And they pay 8*s.*?—Yes; but it does not make any difference to them about paying the 8*s.* I am talking now as a miner. I have never been married, and I have had my candles myself to sell. If I am working with three or four married men and there are single-handed men as well as me, I have not a house to find candles for but those married men have; and they have a wife, and when the packman comes round she wants something, and she will give a penny candle for half a farthing's worth of thread; they must take what they can get for them.

17,313. (*Chairman.*) But the man who makes them or the owner of the mine does not lose?—No.

17,314. The Danby level is very wet, is it not?—It is in very wet weather.

17,315. Are there any ladders in the Danby level?—No; we climb by feet and hands.

17,316. By stemples?—Yes.

17,317. Would you prefer ladders or stemples?—Stemples.

17,318. Why?—For this reason. I have been down in Craven visiting some mines, the first that ever I saw, and when I saw the ladders I may have been nervous, but I dared not have gone down them if I had had all Craven, because I was afraid; if the cramp had taken my hands I had nothing to support me but my bare hands, whereas in our way-gates I can tumble myself in any shape that I like.

17,319. What security have you that the stemples are fixed firm?—We drive them between two sides.

17,320. Do the two sides get loose?—Never, unless the work is too heavy in the hopper or something of that sort.

17,321. Suppose a man misses and does not find the stemple?—He contrives to catch with his foot or something of that kind, but I never miss.

17,322. But if a stemple is out a man may fall?—If a stemple is out he may look out for a corner to put his foot too.

17,323. How do boys manage to go down?—If a boy is a very young one his father takes him on the top of his back.

17,324. Does he attach him to himself?—It just depends upon circumstances; if it be a deep shaft or a deep sumpt he will do so; but they do not take them to work when they are so young, but they take them to receive the money.

17,325. Do not they take them down to hold the jumpers sometimes?—Yes, when they can do so.

17,326. What is the youngest age that you have known?—About 10 years; they will come when they are about nine.

17,327. How will the father take such a boy down?—He would not take him down the shaft at all.

17,328. But suppose he has to go down in a shaft or up a rise?—He will take him on the top of his back.

17,329. (*Mr. Kendall.*) Your stemples are two or three feet wide?—Yes.

17,330. Does not a boy of about 12 years old contrive to go after a while as fast as you can?—Yes; he will beat me now a good bit.

17,331. (*Chairman.*) Did you never hear of any boys being killed from falling from the stemples?—I

* This difference in the cost price and price charged enables the masters to give the cost of the candles and powder to such of the miners as do not make wages and are unfortunate in their trials.—K. M. JAQUES.

REETH.

Mr. T. Coates.

3 March 1863.

never heard of a boy being killed by falling down in that way.

17,332. (*Mr. Leveson Gower.*) Which would be less expensive, to put up ladders or stemples?—We are obliged to put up stemples to keep the mine up, and if we put up ladders they would be an unnecessary expense.

17,333. Are ladders never used in this district?—There is not such a thing in this district.

17,334. (*Chairman.*) Where they go down at Danby level it is about nine fathoms, is it not?—Where they are now working up Danby level it will be about nine fathoms.

17,335. Do the men get wet in going in and out there?—In wet weather they are sometimes stopped, they cannot get up at all, and then they object.

17,336. They could not carry the candle?—No.

17,337. The light would be put out by the wet?—Yes, and then they come out.

17,338. In Danby you depend upon the cracks for ventilation do you not?—Yes, and the Old Man.

17,339. Is Stang another portion of your mine?—Yes.

17,340. Which is the worst part for ventilation?—We have no part which is bad.

17,341. Which do you think is the worst?—I think that we are as badly off at Damrigg as at any place, and there we expect to hole into the Old Man directly.

17,342. But till you hole into the Old Man you depend upon the windy king?—Yes, and a trap door as we call it.

17,343. What is the trap door?—We put in two cheeks, and it is made air-tight, when you take hold of it it will send in a draught like a bullet.

The witness withdrew.

Sir GEORGE WILLIAM DENYS, Bart., examined.

Sir G. W. Denys, Bart.

17,344. (*Chairman.*) I believe that you reside near Reeth?—I do.

17,345. A part of the property round here belongs to you?—Yes; Lord Pomfret, Sir Francis Shuckburg, and myself are the three proprietors of the whole of Swaledale mines.

17,346. Not of the Arkindale mines?—No; they belong to Mr. Gilpin Brown.

17,347. Old Gang is yours?—Yes.

17,348. Do you work any of the mines yourself?—Yes, at present; it is only about a year ago that I took a mine in hand; it was thrown on my hands; in fact, I was obliged to do it, or I would much rather have left it alone; they are called the Blakewaite mines that I am at present working, jointly with some other gentlemen.

17,349. Have they been worked by the Old Man?—They have been worked like all the rest of the field for centuries.

17,350. Are there many men employed at the Blakewaite mines?—At present we have between 60 and 70.

17,351. Who is the managing agent?—Mr. Place.

17,352. Was he a miner before?—Yes, he has been a miner all his life; and was the head agent at Old Gang for the Old Gang Company for some years before I took him.

17,353. Does he report to you regularly as to the state of the mine?—Yes; I have conversations with him, and I go down myself; I was down two days last week.

17,354. Is it a dry or a wet mine?—A good deal of water comes out of the different levels; in fact, they are almost as useful for arterial drainage as for bringing the work out.

17,355. But the work comes out?—Yes, all of it; but we dispense with working by machinery altogether, that is the advantage of working by levels in contradistinction to the Cornish plan.

17,356. Do the men go in by the levels?—Yes, always.

17,357. Do they carry their tools with them or leave them there?—Generally after each shift they bring out their tools to the smith's shop, as jumpers require sharpening every time.

17,358. Have they waggons for bringing them out, or do they generally carry them out?—They generally carry them out, or, if a waggon happens to be coming out at the time, they put them into the waggon.

17,359. Have you seen any difficulty in ventilating any of the mines with which you have been connected?—Until a mine gets opened, of course just at first when you drive a single level you can go 100 or 150 fathoms or 200 fathoms without any great difficulty. Then of course, unless you are going to make a rise to the surface, or to connect this level with some other level which happens to be above you, you must bring your air in by some artificial means; we generally use air troughs or a water blast.

17,360. What is called a windy king is worked by a boy?—I do not know anything of that term here, it may be a mining term, it is probably a local term.

17,361. Are these machines worked by water or by hand?—Both, sometimes one way and sometimes another; but whenever we can get water power of course it is preferred, because you have not to pay for it.

17,362. Does the water turn a fan, or does it convey the air by a blast by pressure?—Generally by a blast.

17,362. Do you know of any men being affected by working?—I think that all the miners are more or less affected by it after a certain number of years.

17,364. Do you think that that is from the air or from the dust?—Partly by the confinement, and the quantity of gunpowder which they are obliged to use; it affects the lungs.

17,365. Have many of the men small holdings?—Almost all of them; their great desire is to have land enough to keep a cow.

17,366. How many hours do they work generally?—Six.

17,367. Does the amount of wages depend very much upon the price of the ore?—There are several ways of paying the men; when there is ore to be got, they make what are called ore bargains, and of course it is diamond cut diamond between the agents and the men. The agents go in and look at the forehead and see the nature of the vein, and judge pretty well how manny bings of metal a man can get with his partners in a given time. Then the agent lets them a bargain of 20, 30, or 40 bings, or whatever it may be, at a certain price, and of course when they have got that bargain their endeavour is to get the metal out as quickly as they possibly can. When you have been working a level without any ore at all, that is called dead work, and the men are paid so much per fathom for it. Then again, if they are working in a very poor vein indeed, which is not profitable, you give them perhaps a little additional money. We will say 40*s.* per bing and 10*s.* per fathom over and above to supplement their wages in that way, so as to encourage them.

17,368. Then it is not put up to competition?—No, there is nothing of that sort.

17,369. It is settled by the agent at the mine?—Yes; generally speaking, most of the companies have, when in good working order, fortnightly meetings. Of course, in a small concern like mine, where we only employ 50 or 60 men, it is not necessary, but the other companies have fortnightly meetings, and the men come in with their proposals, proposing to make a trial at such a place for so many bings at such a

price. Then the masters and the agents decide whether they will take the offer or not. Sometimes it is taken at somewhat less.

17,370. How often are the men paid?—Once a month

17,371. Are they cleared off in full at the end of the month?—Yes; all the men are under deductions for powder and candles.

17,372. But it is not carried on for a year's bargain?—No.

17,373. And no money is retained on it?—No.

13,374. (*Mr. Holland.*) They are paid at the end of March for the March work?—Always; a man may have a bargain that will last a year, but he is paid every month for what he has got during that month, subject to deductions for candles and powder and drawing; the men pay for the work being drawn out of the mine, and the washing of it.

17,375. (*Mr. Kendall.*) Were you ever affected yourself by bad air?—Never.

17,376. You have never had occasion from what you have heard to warn your agents to be more careful with the men?—Never.

17,377. You think that they are careful?—Yes.

17,378. As far as you can judge, whenever you have a long way to drive before you communicate with the surface or some shaft, the appliances of machinery, and so on, are always effectual?—Yes; in fact, the men would not work without it, they would strike.

17,379. Supposing a man is in the least affected by it, would he complain at once?—Yes; and then the masters would immediately put in a rise to get air into the place as fast as possible.

17,380. And during that time he would be quite sure to have all the appliances necessary for air?—Yes, until the rise is completed the men are working in a confined atmosphere; till a communication is made the men more or less suffer during the time of their working.

17,381. But at the same time everything is done to alleviate that suffering?—Certainly; it is to the interest of the masters as well as of the men.

17,382. Supposing that a man gets an ore bargain which turns out after a while to be very profitable to him, do you allow him if he likes it, or the pair, to work extra hours or not?—Yes; they may work as long as they please.

17,383. Suppose that that ore bargain is in a part of the mine where, notwithstanding all your appliances, the air is still defective, you have no power to say to those under, "You shall not work there?"—No. If a man has a bargain for 500 bings, of course, he may work all day and all night too if he likes; but they do not do so, because they are frequently in partnerships of eight men, and there are very few places where more than two men can work at a time, so that two men go in for the six hours and two men for the following six, and so on.

17,384. You do not require the men to work more than a certain number of hours where the air is bad?—No.

17,385. Still, if they choose, in consequence of some discovery, to work 12 hours each instead of 6 hours, you have no power to prevent it, though the air may be bad?—We have not.

17,386. (*Mr. Leveson Gower.*) Have you enlarged your workings?—We began with very few men indeed at first; it was an abandoned place, and we are gradually getting more in. I think that by this day twelvemonth we shall get twice sixty in.

17,387. Have you any difficulty in obtaining more men?—No; there are scores of them waiting for work every day.

17,388. In this district?—Yes, the mines have been poor for several years, and numbers have gone to America in consequence.

17,389. People have left the district?—Yes.

17,390. And none have come to it?—None have come to it.

17,391. (*Chairman.*) Are the poor rates high?—No; the mines are not rated to the poor.

17,392. But still the men may come on to the poor rates?—Yes.

17,393. (*Mr. Leveson Gower.*) Have the wages decreased in consequence of the diminution of work?—No; we are paying higher wages than any of the other companies, solely to induce the men to get into poor places. Until quite lately 40*s.* a bing was what they call the head price. We are now paying 50*s.* and even 55*s.* a bing.

17,394. (*Chairman.*) Is it a great advantage to get experienced men?—Yes.

17,395. (*Mr. Holland.*) Are you able to get as good ventilation by fan as by hooling?—I do not understand what is meant by hooling.

17,396. But during the temporary arrangement the air is bad?—Yes; we do not get enough of it.

17,397. Would it not be worth while to have larger fans?—The companies are anxious to do things as economically as they can, and they would not be at the expense of putting in an expensive fan for perhaps a few weeks or months, when on getting to a certain point the mine would be ventilated in the regular way.

17,398. Are you satisfied that it would not pay to do so; is not the loss of wages in bad air very great?—No, I do not think that it is. They manage it by giving the mine a certain number of hours to get clear of smoke. Of course, there is loss of time, which is loss of money.

17,399. A larger fan would avoid that, would it not?—Yes; the water coming out of the mine would keep the thing going; the levels are generally at the bottom of gills, and there is invariably a beck in the gill. I have been in all directions, and never except just in the forehead of a level have I felt the least want of air.

17,400. (*Mr. Kendall.*) You go in more as an amateur?—Yes; I lived here during my father's time for many years before I had any personal interest in the concern myself, and being a bit of a geologist I rather like the thing.

17,401. (*Mr. Holland.*) Are miners much off work from illness?—When once they begin to fail, they generally give up altogether.

17,402. Not till then?—No; I think that generally speaking they are a fine, healthy class. The smelters have an unhealthy appearance, but that is an unhealthy occupation. If the mill is ever so well ventilated they must inhale a certain portion of the sulphur during the process of smelting.

17,403. (*Sir Philip Egerton.*) Is there a good deal of iron pyrites in the black plate?—Yes; we dislike that exceedingly. There are no noxious exhalations here like what there are in the coal mines

17,404. (*Chairman.*) Have you not carbonic acid gas sometimes?—Not that I am aware of.

17,405. (*Mr. Holland.*) Have you any jets of gas which put the lights out?—No; of course, I will not answer where a mine has been closed up.

The witness withdrew.

Mr. ROBERT DAYKIN examined.

17,406. (*Chairman.*) You are agent of the Hurst Mine?—Yes.

17,407. How many men are employed underground?—About 67 pickmen.

17,408. How do they work chiefly; is it by blasting or picking?—We have both ways.

17,409. Are any women employed?—None in the mines.

17,410. Are any employed on the surface?—We have a few on the surface.

17,411. Do the men go to their work by the level?—Yes.

REETH.

Mr. R. Dayhin.

3 March 1863.

17,412. What is the distance of your longest level ?—The longest level that we have is Queen's, level that is 700 fathoms,—1,400 yards.

17,413. Then there is Pryes level ?—Yes ; that will be about 220 fathoms from its mouth. I am speaking off hand, and in the absence of any plans.

17,414. Which is the richest level ?—Pryes level.

17,415. How many partnerships have you at Pryes level ?—About 30 men.

17,416. Do they work night shifts ?—Yes, when required they do so.

17,417. In working per bing do they work night shifts ?—Yes, when required; but when they can work their work in the daytime they do so.

17,418. Have you many night shifts ?—Yes; about eight or ten men, working six hours each, night shifts at present.

17,419. Do you depend for ventilation a good deal upon the fissures ?—No ; principally in that level, by shafts.

17,420. The Old Man's workings ?—These are useful for ventilation when open; we have not those, we make new ones for that purpose.

17,421. But there are swallows in your mine?—Yes ; the Commissioners saw yesterday a very great one, in Pryes level especially.

17,422. Does the air come down the swallows ?—Both ways sometimes.

17,423. Water comes down the swallow sometimes?—Yes, that swallow has taken 140 gallons a minute, it is a regular fissure in the 12-fathom lime.

17,424. That helps to ventilate it considerably ?—Yes ; but we have a shaft there as well, called East Close shaft, and many sumps therefrom, and that convey wind underneath that level, and we put up rises to ventilate it completely.

17,425. There was one part where the candles did not burn ?—That was when the Commissioners were down. At that time the great Swallow was overset, and the lower way-gates there flooded through the wet weather, which prevented the pure air either coming on them from East Close shaft or Swallow ; but as soon as the rough weather abated, the water therein passed off ; wind came.

17,426. (*Mr. Kendall.*) The water had risen there?—Yes.

17,427. And that prevented the circulation of air?—Quite so; it was during that wet weather.

17,428. (*Chairman.*) Have you seen that happen before ?—It happens occasionally ; but it is generally in extreme weather when there is a great deal of wet or anything of that sort.

17,429. That stops up your fissure which is your means of ventilation ?—Yes; but there are some shafts further west which we intend to open out as we go along.

17,430. But till you get to those shafts you may be liable to that stoppage ?—Yes; but it will not be long before we get to them. There are, however, means of getting air by a machine, which we now use.

17,431. That you call a windy king ?—Yes.

17,432. That is worked by a boy, is it not ?—We have one driven by water and another by a boy, that is to say when they are wanted, but not always.

17,433. When it is worked by a boy, where do you put him ?—Generally at the side of the level.

17,434. That is at a considerable distance from where the men are working ?—Yes; it is always at a considerable distance, we put him where there is good air, and convey it in wooden boxes.

17,435. The boy forces the air on, but he does not draw it on ?—He does not draw it on, but forces it on ; we can do it both ways by these hand machines. We do not use any boys at present. It is pretty well ventilated.

17,436. Do the men all go in by the levels ?—Yes.

17,437. What are the deductions which are made in the men's wages ?—They pay for their own candles, powder, tools, and the drawing of their work to the bank ; but we charge them only a little more for these things than what they cost us.

17,438. What do they pay for candles ?—8*s.* a dozen.

17,439. Where do you buy them ?—In Richmond.

17,440. What do you pay for them ?—I think somewhere about 5*s.* 6*d.*, at present; but they have been more.

17,441. Are you particular as to the quality ?—Always ; we have them 12 to a lb., and with a good wick.

17,442. Have you ever had to return them from the quality not being good ?—Sometimes ; but they are generally good candles. They know near about what we want.

17,443. Have you known of men broken-winded from working in the mines ?—Yes, we have some ; but I am afraid that a great deal of this arises partly from constitution and habits ; some men are not very cleanly, and it sometimes happens in that way ; I have found fault with many miners on that account, not in our mines particularly, but in other places as well.

17,444. How do you mean, not cleanly ?—They do not wash before they eat, &c., and perhaps they do not take proper care when they come out of the mines. I think that if they would wash before they ate, it would be much better.

17,445. Is any part of your mine dusty ?—Yes ; where it is hard, and we have to blast, it is dusty.

17,446. Do the men ever complain of the dust ?—They complain of the dust, of course, and where blast reek is ; but where there is a good ventilation of air that is soon driven off.

17,447. How long is it in blasting before the powder reek gets away ?—It varies ; I have seen it stay a long while, and I have seen it pass away immediately where there is a good current of air.

17,448. But where there is not a current of air it is a long time ?—Yes.

17,449. How long ?—It varies, sometimes it passes away in an hour, and sometimes it takes six hours.

17,450. And where it does not pass away quickly it affects the men ?—Yes.

17,451. Have you ever any carbonic acid ?—Yes, especially in the lower workings.

17,452. Do you come upon it suddenly, or is it from accumulation ?—I have known it accumulate, especially from change of weather, and when the weather has changed again I have known it all to have passed away.

17,453. (*Mr. Holland.*) Do you mean a change of weather checking the draft?—Yes.

17,454. (*Chairman.*) How do you know that it is carbonic acid ?—I have known it because the candle will not burn. It is well understood to be there. It is called choke damp with us.

17,455. Have you observed it low down or high up the level ?—It has been in all places where there has not been a free circulation, and especially where there has not been a double way-gate.

17,456. Have you ever seen it come out of the rock ?—It will come out of all fissures. I have found air come out, and most likely it would be mixed with carbonic acid as well.

17,457. Have you ever seen it put the candle out when you have held it to it ?—I do not know that ; I have never noticed that in the lead mines.

17,458. I suppose that the candle is the only means which you have of judging ?—There are other means of judging in the mines. The cautious miners can soon tell. It will affect their limbs and cause a drowsiness and lassitude ; it affects their head.

17,459. Do the men come out at once when they find that to be the case ?—Generally when the candle will not burn they are obliged to come out ; they cannot stop long in it ; but that soon passes away when there is a draught.

17,460. Do you use zinc pipes ?—We have not any in our mine, but they are used. We use wooden boxes four inches by six, and they carry wind pretty well.

17,461. Does the timber decay at all in your mine ?—Yes, very much.

17,462. Do you arch with stone ?—All with stone in our place.

17,463. The timber would not last ?—No.

17,464. Have you ever found any effect from the decayed timber ?—I have found effects from the decayed timber, and especially where there is not a free circulation, you will find a sourish smell of carbonic acid, and a taste as well.

17,465. Do you think that there is any accumulation where the Old Man has been ?—No, not much. When there is a free circulation that passes away ; but you can never ventilate where the way-gates are driven in plates so well, because they are not so porous as other strata.

17,466. The plate is generally the worst, is it not ?—Yes.

17,467. Is that from the dust ?—No ; not so much from the dust, but from crumbling. It seems to crush and crumble, and fills up the place, consequently you cannot keep those way-gates so long open as you can with stone, because, generally, rock is full of fissures, and plate is not so.

17,468. (*Mr. Holland.*) Have you known it fill up the way-gate behind you entirely ?—No ; but if you have a double way-gate for ventilation it will crumble, but you must keep open your main way-gate where you work at whatever expense it may be.

17,469. (*Chairman.*) If an old working or way-gate has been left for ventilation, unless it is arched, if it is through plate, it will fill up ?—It will.

17,470. And will, therefore, stop that means of ventilation ?—Yes.

17,471. This mine has been a poor mine for some time, has it not ?—It has been poorish for some time.

17,472. I suppose that in a mine yielding a good return many improvements could be adopted which you cannot adopt in a poor mine ?—Yes. Sometimes we are led to carry our leading foreheads a long way from our air shafts ; the wind is conducted in wooden boxes ; but if the mine had been paying we should have made a new air shaft near to the forehead. But sometimes when things are poor, you do not carry everything up to the mark as you would do otherwise.

17,473. (*Mr. Holland.*) You say that the timber in the mine decays very much ?—Yes.

17,474. Much more than in the open air ?—Yes, except where there is a great deal of water. It is what we call the dry rot.

17,475. It is fungus, I suppose ?—Yes.

17,476. Does it decay much more in some parts of the mine than in others ?—Yes.

17,477. Is that affected by the ventilation ? — I thinkso, especially in dry places; it decays very much.

17,478. In dry places with bad ventilation ?—I do not know exactly as to the ventilation. I have seen good ventilation in dry places, and the wood has decayed.

17,479. You have not noticed whether the amount of ventilation in different parts of the mine affects the timber very much ?—I have not exactly noticed that, but especially where there is a great deal of water the timber will last longer.

17,480. You say that you know that there is carbonic acid in the mine because it puts the candle out? —Yes.

17,481. But the poor air will put the candle out, will it not ?—We have never to contend with anything in the mines but carbonic acid and smoke from gunpowder used in blasting.

17,482. Have you noticed that that gas is more at the bottom of the level or at the top ?—Always at the bottom.

17,483. Very markedly so ; the candle will burn at the top, but not at the bottom ?—Yes. When we have it it will burn better at the top than at the bottom.

17,484. Is the dust in the mine so much as seriously to affect the men ?—Where it is a dry place perhaps it might ; but I have not heard men complain very much about dust. It is chiefly from want of pure air.

17,485. Chiefly of poor air ?—Chiefly of pure air.

17,486. (*Mr. Kendall.*) Before you were an agent did you work as a miner yourself ?—Yes.

17,487. How early did you begin ?—About 10.

17,488. What age are you now ?—48.

17,489. How many years have you been an agent ? 22 I think.

17,490. Did you ever work in any close ends ?—Yes.

17,491. How is your health now ?—My health is pretty well now.

17,492. You are as strong as ever ?—Yes.

17,493. You can do any work ?—Yes.

17,494. From your recollection do you think that miners live longer now than they used ?—No, I believe not. I do not think that there is any alteration whatever.

17,495. Do you think that they are a short-lived class of men as compared with the agriculturists, or not ?—I think that they are shorter lived.

17,496. Do they live imprudently ?—No, I do not think that they do ; but I think that the mines to a certain extent may affect them, and besides that they have not always good accommodation in their houses.

17,497. Taking the agriculturists and the miners, the agriculturists have better accommodation and more ventilation in-doors than the miners ?—This I cannot properly define.

17,498. Are they cleaner as a body ?—I do not know ; I am not much acquainted with the agriculturists.

17,499. (*Chairman.*) Are the cottages in your district good ?—They are pretty good of the kind, but small.

17,500. (*Mr. Holland.*) Do your men live near to the mine, or some distance off ?—Near to the mine. I think that it is an evil to have the cottages so near, a man is always better for having to walk a certain distance ; I have remarked it, a man thrives better and gets his lungs more cleared by walking a short distance from work previous to eating. I think that he ought to walk two or three miles.

17,501. (*Mr. Leveson Gower.*) Do the miners give a great rent for their land ?—No ; I think that it is let in our parts at much about the same as in other districts ; it will let for rather more in a mining than in a farming district.

17,502. (*Mr Kendall.*) Some time since there was very bad ventilation in consequence of the rise of water ?—Yes.

17,503. Did it ever happen to be so bad before ?—It might ; I do not remember it.

17,504. That is the only instance during your agency that you recollect bad ventilation in the mine? I have seen other mines as bad or even worse, but this water was an influx during wet weather, as I said before ; but that part of the mine you perhaps refer to, viz., Pryes level, has only been in working during the last three years of my agency.

17,505. And it does not occur frequently ?—No; I should say not above once in a season. We have a shaft which ventilates the whole independently of the swallow ; it is to ventilate the mine independently of everything.

17,506. (*Chairman.*) Is that shaft up-cast or down-cast ?—It depends upon how the wind blows.

17,507. (*Mr. Holland.*) Whether the wind blows up the adit or not ?—Just so.

17,508. (*Chairman.*) Have you ever thought whether it is advisable to make it constantly an up-cast shaft ?—We can do so; it is a matter of no consequence which way the air passes ; we don't suffer much from the want of air there.

The witness withdrew.

Mr. Francis Taylor examined.

Reeth.

Mr. F. Taylor.

3 March 1863.

17,509. (*Chairman.*) You are agent for the Old Gang Mine ?—Yes.

17,510. How many men are employed underground in the Old Gang Mine ?—I should think about 200 men, and about 50 boys.

17,511. Do you make any limit as to the age at which boys shall go underground ?—We generally keep them working upon the bank till they are 11 or 12 years of age; unless it be a father who wants to take in his boy himself, and then we allow him to take him at 10 or 11.

17,512. But I suppose the father sometimes takes a boy younger ?—No, we keep them employed at bank; that is a rule of our company.

17,513. You would not allow the father to take a boy down any mine under that age ?—It is generally about 11 if their fathers are with them themselves. I can give a statement of near about the ages of all the boys.

17,514. What is the length of the lowest level ?—The level that we were in yesterday is the longest that we have; that would be within about 170 fathoms of the far end, where it communicates with another level which comes up from the other side of the hill.

17,515. Do you know how long it is ?—Not exactly, but I think that it is a mile and a half.

17,516. Do the men always go in by the level, or do they go in by the shafts ?—They generally go by the shafts; unless they may meet with a horse going up, and he takes them up.

17,517. And they go down the stemples ?—Yes.

17,518. Have you ever had an accident from the stemples ?—Never since I have been agent.

17,519. How do the boys go down the stemples ? They can go down as well or better than men; boys take no harm.

17,520. You think stemples quite safe for the boys to go down ?—Quite; because they generally go above their fathers, and the father is there to shew them light.

17,521. The father helps them down ?—He never has much occasion to do so.

17,522. Have you ever been in a mine with ladders ?—No, not for any length of ladder; I have for a few fathoms.

17,523. Would you prefer to have ladders or stemples if you had to go up and down ?—Any person that I have ever talked to about the matter who has worked where others were has quite preferred stempling.

17,524. (*Mr. Kendall.*) Those who have tried both prefer stemples ?—Yes.

17,525. Supposing you had a ladder must you not have stemples also ?—It depends upon the length of the shaft.

17,526. (*Chairman.*) How are the stemples fastened ?—The stemple is put into the hard side, and it is driven tight.

17,527. Do not they sometimes come out ?—Never as long as they are sound.

17,528. But if the wood decays they will ?—If the wood decays we employ wood men to look after the waygates, and they are repaired; one is knocked out when it is worn by the men or boys' feet, and they put in a new one.

17,529. You have men specially to look after the way-gates ?—Yes, six to look after the Old Gang way-gates.

17,530. Do you use much timber ?—We use timber in the workings, but not so much in the main levels; we wall and arch the main levels.

17,531. If men want timber when they are driving a forehead, to whom do they apply ?—They generally apply to me, to tell me that they want timber, and what sort of timber they want, and then I write to the wood agent.

17,532. How often do you generally inspect the mine ?—I go inside three or four times a week, and I attend every day upon some business.

17,533. Is there much dust in any part of the mine ?—No; the mines are quite different from what they were when I began to go into them; they are better ventilated, and more communicated one with another.

17,534. (*Mr. Kendall.*) The ventilation itself would not at all interfere with the dust in the workings ?—No, not in the close workings; but by machines we can work with better air.

17,535. (*Chairman.*) Is there any part of the mine where it is so dry that there is a great deal of dust in the workings ?—There is in certain places where we have cross cuttings.

17,536-7. What is the dust most in ?—In grit and shale there is the most unhealthy dust with us; it is worse than lime.

17,538. Is what you call shale the same as plate ?—Yes.

17,539. Which is worst, plate or grit ?—Grit, if you have to work it with pick; but we generally blast it.

17,540. But the plate you work with pick ?—Generally.

17,541. So that it makes more dust ?—Yes, and it is more unhealthy for the workers.

17,542. More unhealthy in what way ?—From the dust.

17,543. Is there more of it, or is it from the kind of dust ?—It is from the kind of dust.

17,544. You think that it affects them more ?—Yes; and there is more of it in working with pick than with blasting; after the blast has gone you do not find so much of it, but the men are more exposed to it from being nearer the pick.

17,545. How long is the powder smoke getting away ?—It is not very long in some places; a great deal depends upon whether you have wind or not.

17,546. When you have the windy king going, how long is it ?—You can blow it out in a quarter of an hour or twenty minutes.

17,547. What is the price which the men pay for the candles ?—They pay 8*s.* a dozen lbs. with us—8*d.* a lb.

17,548. Where do you get them ?—Our company make them; they buy their own tallow and employ a tallow chandler.

17,549. Do you know at what cost they can be had in that way ?—I do not.

17,550. What do the men pay for the powder ?—6*d.* a lb.

17,551. Are there any deductions for club or doctor ?—No.

17,552. You did not get so far as the Bunting level?—No.

17,553. That is wet ?—Yes.

17,554. Should you say that that part of the mine was not so well ventilated as the rest ?—I should say that it is better ventilated, because the air can go through in the old workings anywhere.

17,555. Is there any one particular shaft which is the up-cast shaft ?—Yes.

17,556. Is it always that ?—It does sometimes change, it will change in summer with a drought or a change of weather, or something of that kind. The deepest shaft which I showed the Commissioners is generally an up-cast shaft.

17,557. But in some weathers it will change ?—I have known it to do so but very seldom.

17,558. Have you ever had a place in which men have been working there lately, where the candles would not burn well ?—No not lately.

17,559. But I suppose, in your experience as a miner, you have known that to be the case ?—Yes.

17,560. What does that arise from, in your opinion?—Scarcity of air.

17,561. Not from carbonic acid gas ?—Those are terms which I do not exactly understand.

17,562. Have you seen the candle not burn well

when it has been held up near the top of the level or, at the lower part of the level ?—I know that there is a difference.

17,563. (*Mr. Holland.*) At which part has it burned best, top or bottom ?—It has burned best at the top.

17,564. Always ?—Not always.

17,565. Does it ever happen that when you lower the candle it goes out quite suddenly ?—No, not in workings which we have now; but I have seen it formerly where it has died out blue.

17,566. Just as if you put it into water ?—Yes.

17,567. What does it cost to work a blower ?—The boy who turns it has 8*d.* a day.

17,568. Is the expense of that blower saved in the saving of the men's labour who are supplied with air ?—The company pays that.

17,569. But do the men work better for it ?—Yes; you may say twice over.

17,570. It is more than twice over, is it not ?—Yes, I should think so.

17,571. (*Chairman.*) The company pays the boy ?—Yes.

17,572. Where do you put the boy to work the machine; do you put it near where the fresh air is, or do you put it near where the men are working ?—We put it not quite to where the fresh air is, and we have pipes back into it and pipes forward.

17,573. How far should you say it ought to be from where the men are working ?—Some persons prefer its being very near, but that is very unhealthy for the boy; we never carry ours so near. I should think that where we were up yesterday it was about 28 fathoms off the men, and some six or seven fathoms off where the fresh air went.

17,574. How can you be sure that the boy will always keep working ?—The men can tell that by hearing whether the machine is working, and putting the candle to the pipe end; when they are feeling rather scarce of air they will give him a tap at the pipe, and it comes very soon to him, and he goes on working it.

17,575. Have you ever tried a water blast in that mine ?—Yes.

17,576. A water blast, or to turn the fan with water ?—A fan will carry a stronger wind if it be near, but a water blast is regular, and will blow a long way.

17,577. You prefer a water blast ?—Yes, for a mine which has to be wrought a long way off. I should think that we drove as long a cross cut on our field as has ever been driven by the water blast.

17,578. How many fathoms ?—I should think 300 fathoms.

17,579. With what sized pipes ?—I should say four inches or four and a half in diameter.

17,580. Made of zinc ?—Yes.

17,581. How long do the zinc pipes last ?—They do not last very long in some situations, they corrode and wear in holes where the water drops, and where they come in contact with holdfasts; we leave them under holdfasts; when that happens a new one is put in.

17,582. (*Mr. Holland.*) You mean an iron holdfast ?—Yes.

17,583. Do not you hang them by leather ?—No; we put them upon an iron crook, and a piece of wood to keep them off.

17,584. (*Sir Philip Egerton.*) How long before we went up the stemples yesterday had the shots been fired ?—The men heard of our coming after they had fired the holes.

17,585. (*Mr. Kendall.*) We were up within 20 minutes ?—Yes; we stayed nearly 20 minutes sending the men up to return the work down.

17,586. No, we were not so long as that; the men said a quarter of an hour; and I think that we must have been in within 25 or 30 minutes after the blast ?—Yes, I think so.

17,587. (*Sir Philip Egerton.*) Did it not happen that the strap of the windy king broke while we were there ?—The strap broke while we were there.

17,588. So that if the windy king had been in working order, the smoke would have been more cleared away than it was ?—I should say that it would have been near about clear when we got to the top.

17,589. The candles burnt quite clear when we were there, notwithstanding ?—Yes; I believe that if the strap had not broken you would have seen very little smoke; the boy was turning it when we got out of the waggons, and when we went by him it broke.

17,590. Do your miners live near the mine, or have they some distance to walk ?—Some of them have two miles to walk.

17,591. Are they in the habit of changing their clothes when they come out of the mine, or do they go home in their wet clothes ?—They do not change them unless they be working in a very wet place; if they do, they perhaps carry a change with them, but we have none who are working who require that now.

17,592. (*Mr. Kendall.*) How long have you been an agent ?—About seven years.

17,593. How long have you worked as a miner ?—About 39 altogether, agent and miner.

17,594. Did you ever work in any close fore-heads ?—Yes; I was always a dead work or cross-cut workman.

17,595. You worked in close fore-heads ?—Yes, as long as I wrought in mines, and after that I wrought the dressings five years before I was agent.

17,596. Have you found your health fail from working in those close fore-heads ?—No, I never did much.

17,597. Did the health of any of the men who worked with you in the close fore-heads fail ?—Yes; they were older perhaps.

17,598. Do you know any men of the same age as yourself, whose health failed from working in the close fore-heads ?—Not exactly at the age at which I gave up.

17,599. But in some other close fore-heads have you heard men complain much ?—Some men break up at 60 and some men at 50.

17,600. But they take more care than they did in old times ?—Yes; there is much more care and much more ventilation made in the mines by the masters than when I was a worker.

17,601. (*Chairman.*) I suppose that that depends very much upon whether they are poor or rich mines. In a poor mine there is not so much done as in a rich mine in the way of ventilation ?—Of course, if it is profitable they will be able to lay more out; but our masters are very good for looking after that, and they always enjoin us agents to look after it.

The witness withdrew.

Mr. Thomas Raw examined.

Mr. T. Raw.

17,602. (*Chairman.*) You are agent and manager of the Surrender Mine ?—Yes.

17,603. What number of men are employed under ground there ?—About 120 men and boys.

17,604. How many boys ?—We have 33 under 20 years of age.

17,605. Do you make any rule about the age at which they shall be allowed to go under ground ?—We do not allow them to go until they are turned 12, unless they are very strong boys; and unless a father takes his son with him, if he is a strong boy. We endeavour to put him into a convenient place, so that he is not exposed to danger; he can be taken up in the waggons to a near place where he can get assisted up on coming out.

17,606. I suppose you would say danger from climbing ?—Yes, a boy of 12 or 14 or 15 is not so able to climb as one of 20, and so on; they are not so strong. We generally let them go up the levels where there is no climbing. In many places they work close to the level side where they have no ascending or descending.

REETH.

Mr. T. Raw.

3 March 1863.

17,607. But with a boy of 10 it would be dangerous to climb ?—A boy of 10 is too young.

17,608. Do you make any regulation about the boys having been to school ?—No ; we have not interfered with their scholarship.

17,609. Are there any women employed on the surface ?—Yes, in dressing the ores.

17,610. Is that a general practice here now ?—It is.

17,611. As much as it used to be ?—Perhaps not to the extent that it was formerly, some 50 years ago, or something like that, I think.

17,612. Do they work under cover ?—Yes, they have sheds generally.

17,613. Is there any objection to their having sheds? —No, I do not know that there is ; they shade off a little light, so that they cannot see their work quite so well, but they are so open that they manage to do it tolerably well.

17,614. I suppose you could make the sheds so that it would be light ?—They could be made a little more elevated in some cases, which would allow a little more light to get in.

17,615. You enter the Surrender Mine from Arkindale ?—Yes ; we go through the Arkindale royalty up the Arkindale level into our ground.

17,616. Did you know the mine before that communication was made ?—No ; I was not agent before that communication was made.

17,617. I suppose that that has improved the ventilation and facilitated the means of working ?—Yes.

17,618. Could it have been carried on without that? —Not to any profit or advantage.

17,619. In which of the beds do you find most of the ore ?—Generally the 12 fathom lime, and the chert which lies above it ; that has been the most productive in the Surrender ground.

17,620. Do you find any in the plate ?—Very seldom, unless we have limestone or chert opposite the plate side, that being the case we have sometimes found ore.

17,621. Is it a dry mine?—No; we have heavy water coming from above, but it is conducted in troughs down to the level, and runs out at the mouth of the level.

17,622. Are you troubled at all with the dust in the Surrender Mine?—Not much ; it is well ventilated, and free currents of air pass generally through our workings, having a good up-cast shaft.

17,623. Is it always an up-cast shaft ?—Yes, except in dry weather ; the men take it as an indication of its going to be dry weather when it is down-cast and the air draws out at the level.

17,624. To a certain extent the air is stagnant when that change is taking place ?—Yes, just for a few hours, at the time of the change, it is reversed in its course.

17,625. Which kind of dust is most injurious to the men ?—The plate.

17,626. In what way ?—It seems to be most heavy. I think that it lies most upon the lungs of the men. After they have been in the plate forehead, and have worked hard for a while, they will spit very black stuff.

17,627. Is it that there is more dust or that the nature of the dust is bad ?—There is more dust, and the nature of it is bad too ; it is heavy and black.

17,628. How long will they spit it after they have left work ?—For four or five hours. I should say some perhaps longer.

17,629. How do the men go into the mine ; do they go by the level or by the shaft ?—Both ways. The men who descend by the shaft work in the upper part of the ground, and they put their work down in hoppers to the level, and ascend back out of the shaft when they return home.

17,630. They go down the shaft by stemples ?—Yes.

17,631. Is the shaft used for drawing or anything besides ?—No ; it was formerly, but is not now ; it is now just used as a way-gate and for ventilation ; we keep it open for that purpose.

17,632. From your experience should you prefer stemples or ladders ?—I think stemples are as well. I believe that men will climb as easily on stemples as on ladders; they are not so contracted.

17,633. How do the boys manage the stemples ?— When they become 16 or 18 and sufficiently strong they do it tolerably well, but the father takes care that he is in front of his son, or if he allows him to go in front he attaches a rope to him so that if anything happens to the boy and he gets a slip, or anything of that kind, he has hold of him.

17,634. He ties the rope round the boy and round himself ?—Yes ; he does for the safety of the boy.

17,635. Have you ever had an accident ?—We have have had two accidents in that shaft since I became agent.

17,636. Were those from slipping ?—Slipping in the shaft. One was a young man over 20, his feet slipped and he was killed ; the other was a little boy, his father was with him, and he slipped and he lost his life by it.

17,637. Is it not sollered in any way ?—We have half buntings as we call them ; half the climbing way is covered over with planks, so that a person slipping or falling might catch upon them and be prevented from going further.

17,638. Have you any men specially employed to look after the way-gates ?—Three men are regularly employed (what we call our way-gate repairers) to keep the shaft and all the principal way-gates in proper condition for the men to pass.

17,639. Do they report to you at all upon the state of them ?—I inspect them.

17,640. Do they report to you, or do they on their own responsibility repair them ?—I direct them where to go to improve and repair if a place is getting wrong and dilapidated.

17,641. (*Mr. Kendall.*) If they saw any weak point would they at once repair it without speaking to you? —Yes.

17,642. They have no entry book ?—No ; we keep no entry book.

17,643. (*Chairman.*) You manage the whole ?—I do.

17,644. Do you pay the men ?—Yes.

17,645. How often are they paid ?—Monthly.

17,646. Both classes of men, whether they are working by bing or by fathom ?—Yes. We make our pays monthly—12 in the year.

17,647. What do the men pay for candles?—8*s.* per dozen.

17,648. Where do you get them ?—We make them ourselves.

17,649. Do you think that a good plan ?—I do.

17,650. Why?—We buy first-rate tallow and get a good wick and pay a tallow chandler so much per dozen for making the candles, and then we think that when he has good material to work upon he will put forth good stuff.

17,651. What do they cost per dozen ?—I am not aware of the cost of the tallow, but perhaps 5*s.* 6*d.* or 5*s.* 8*d.* ; I think that it stands at that at present.

17,652. You think that to ensure a good material for the candles is important ?—I do. When the air is bad in a mine and the men have a candle burning made of bad material where they are breathing I think that it is pernicious to their health, and I think that it is beneficial to the health to have good candles.

17,653. Do you mix anything with the cotton ?—I believe that it is pure cotton.

17,654. Does it give light enough ?—Yes ; quite sufficient light.

17,655. I suppose that the ventilation of a mine where you are communicating with the Old Man's workings is more easily effected than in a new mine? —Yes.

17,656. I suppose that a maiden or new mine costs more to ventilate it properly ?—Yes.

17,657. Have you ever worked where the air has been bad ?—I worked 17 years in the mines before I became a mine agent. In some places I have worked

where the air was not very good, but I never took much harm by it.

17,658. Have you seen a case where any gas coming from the rock has put the candle out?—In some cases where we have come at what we call a loff, or an incision in the rock, when it has just become bare, we have seen impure gases issuing out from those places, and it has sometimes put out our candle. We generally call it foul air in our mining term, or poor air; it just comes out of a fissure; and when we have been working in a mine and have laid bare a fissure in the rock in that way we have sometimes found it so.

17,659. What kind of rock was it?—I do not know that any particular rock is more subject to it than another.

17,660. (*Mr. Kendall.*) Did you ever in passing by any of those crevices hold up your candle to see whether or not it would put it out?—Yes, I have done so where we have been opening ground; but it does not continue long so because a current of air passing by extracts it and carries it off. In some places where you have a drift a few fathoms from what we call our air drift we have sometimes found the air very bad as though the foul air was confined.

17,661. (*Chairman.*) Where you have to employ artificial ventilation, which should you say was the best means?—I like the water blast the best when you have water power at your own place, a water blast being more serviceable.

17,662. Which would you think best, driving in air or extracting it?—We have tried both ways. I think that it is well, where you can, to form a vacuum, and the good air will then pass forward and fill up that vacuum. We had a long rise at Surrender for 30 fathoms, and we had no air but what we forced up, and as soon as I put water into the water boxes and brought it to the end of the 30 fathoms it forced all the foul air out; the good air rushed up the rise and we were well supplied; the water falling the 30 fathoms it had great power, and brought all the foul air out.

17,663. (*Sir Philip Egerton.*) Have you ever tried furnaces for rarifying the air?—No.

17,664. The cost of fuel, I suppose, would be too great?—Yes. Our shaft is a regular up-cast one, except in certain seasons, as I tell you, and you can see it smoking out as you pass by.

17,665. (*Chairman.*) If you put a fire in it, it would make it a constant up-cast, and a greater up-cast; you have never tried that?—No. In fact we have had no need of that in our shaft. There is quite a sufficient current of air, so that you could sift wheat from the chaff very nicely, and blow your candle out.

17666. (*Sir Philip Egerton.*) Do you work principally by pick or by blast?—Both ways. Where it is pickwork we work with pick, and where they cannot get it by picks they then blast it.

17,667. Are your blasts fired by fuses or by squibs?—Sometimes, when we have water, by fuse, and when it is dry by squib.

17,668. How are they tamped; is it by an iron tamping tool?—Yes.

17,669. Is there no copper at the lower end?—No; we make our needle of good iron, and what we call the beater is made of the same.

17,670. Have you found that the iron tamping rod is liable to make sparks when it comes in contact with the chert?—We have had very few accidents.

17,671. You have had accidents?—We have had accidents on some occasions, but I have always blamed the men. They have perhaps got the chert into the hole to tamp with.

17,672. Have you seen tamping tools shod with copper?—I have.

17,673. Do you not think that they are more safe to use than iron ones?—Perhaps they are safer; they will not fire as the iron will; but if the miner uses great care in his tamping there is no danger.

17,674. Is it usual to use iron tamping rods?—Yes.

17,675. Do the other mines use copper ones or with copper bottoms?—Not in this neighbourhood that I know of.

17,676. Have you had any recent accident from any explosion in a mine?—No.

17,677. When was the last that you remember?—It is a good few years ago since we had an accident, I should say eight or ten years, and the man was so foolish that he beat the hole before he should have done so.

17,678. Have there been any accidents in a neighbouring mine?—Not that I know of.

16,679. Is your mine a wet mine?—We have a good deal of water in our mine.

17,680. Do the miners get wet in working?—Not many of them. We have it so conducted that we have it tolerably dry.

17,681. Are the men in the habit of changing their clothes after coming out of the mine before going home?—No.

17,682. Are there places where they could do so if they were so inclined?—Yes.

17,683. But they do not?—No.

17,684. What distances have they to go?—From one to four miles.

17,685. Do they generally go home for their meals?—They have their breakfast in the morning, and take their dinner to the mine with them, and work up till the time when they come home.

17,686. What number of hours do the men generally work in your mine?—Six hours we look for the men working.

17,687. Have you night shifts?—Very seldom.

17,688. (*Mr. Holland.*) Do you use any precaution to prevent accidents in blasting?—Yes; we generally caution the men.

17,689. Do you put anything soft between the tamping and the powder, any hay or paper, or anything of that sort?—They generally put what we call dust if they have it.

17,690. You mean sandy material?—Yes.

17,691. (*Mr. Kendall.*) Do you recommend the men to tamp with oak at first; in some parts of the west of England for the first layer or two, until there is something between the powder and the iron, they use oak; do you use that here at all?—No. As soon as they have got the powder into the hole they put it up with what they call the scraper as close and tight as possible.

17,692. What is the scraper made of?—Iron.

17,693. No sooner is there powder than you have that iron in contact with that powder?—Yes.

17,694. And then you have dust or shale?—Yes; and then you put the needle, and you then put in the beater.

17,695. (*Mr. Holland.*) Is the needle an iron needle or a copper needle?—An iron needle.

17,696. (*Mr. Kendall.*) Notwithstanding all that, you have not heard of an accident for many years in the district?—No; we have not had one at our place for many years, and I do not know that there has been one in the neighbouring fields.

17,697. (*Chairman.*) Do you use the safety fuse?—Yes; we use the safety fuse when we are amongst water.

17,698. And cartridge?—Yes; what we call bags.

17,699. (*Mr. Holland.*) When you are not in water, do you use a common reed or straw?—We use what we call a squib, made with paper, when we are not amongst water.

17,700. Does not that frequently miss fire?—No; if they are properly made they never miss fire.

17,701. Are they very often improperly made?—That is the men's neglect if it is so.

The witness withdrew.

Mr. John Knowles examined.

Reeth.
Mr. J. Knowles.
3 March 1863.

17,702. (*Chairman.*) Do you reside in this neighbourhood?—About four miles from here up the Dale.

17,703. You are connected with some of the mines?—Yes; I am connected with Arkindale, Old Gang, and Beldihill.

17,704. Are these mines all entered from the level?—Yes.

17,705. You consider that the best way?—Yes, both for ventilation and for getting the work out.

17,706. And getting rid of the water?—Yes.

17,707. Are all these mines connected with the Old Man's workings?—Yes.

17,708. I suppose that it facilitates the ventilation?—Yes, very much.

17,709. Are these shafts of the Old Man's used for ventilation as up-cast shafts and down-cast shafts?—Yes; they are principally up-cast shafts, but the air goes in at the level.

17,710. Does it vary at all with the weather?—Sometimes it does a little in summer, but very seldom.

17,711. Have you ever seen a plan of having fire or anything in the shaft to make the draught stronger?—Yes, in the coal pits.

17,712. But not in this district?—No; we have no occasion for it.

17,713. I suppose that the difficulty in ventilation comes when you are driving a forehead?—Yes; that must be pushed forward, and we ventilate it with pipes.

17,714. Then you have to employ artificial means?—Yes, either by a water blast or by fans blown by hand; and then when we get to a workable vein, we air it by communication with a rise up to the day.

17,715. I suppose that in new and trial ground, or maiden mines, it is more difficult to get ventilation?—Yes. In working a vein in new ground we generally have our horse level forward of where the men are working at ore above, and we carry a way-gate above the horse level, and we keep it open, perhaps every 50 or 100 fathoms, we put up rises from the horse level, and we carry our wind forward in that way.

17,716. Most of the workings are above the horse level?—Yes; we always contrive that if we possibly can, and then the work comes down hoppers instead of having to lift it. Sometimes it may be five fathoms higher, or it may be 20. It just depends upon the strata that we are in.

17,717. The men complain, I believe, most of dust, do they not?—Yes.

17,718. In what place is the dust worst?—It is the worst in a hard, dry forehead where it is to blast.

17,719. Is that worse than where they are in picking?—No, I do not think that it is. Of course, where it is very soft there is no dust, but it is chiefly in a hard forehead.

17,720. (*Mr. Holland.*) In what rock is the dust worst?—In the lime and the chert. The chert is between the lime and the plate. It will not burn to lime, it is a kind of hard plate bed.

17,721. (*Chairman.*) Are the men much affected in their breathing?—Yes, they are, when they get to a certain age.

17,722. From what do you think that that arises?—From working in the mines there is the black and there is the dust as well. At the same time we have men now who are working in the mines upwards of 70 years of age.

17,723. Some men are affected when young, and others are not affected by it?—Yes.

17,724. Does that at all, do you think, depend upon the mines in which they have been working?—Yes, if it has been a hard forehead they are more affected.

17,725. (*Sir Philip Egerton.*) Are you a shareholder?—Yes.

17,726. Do your company take any steps for providing medical aid to your workmen?—No, we do not; but if a man should happen to receive any little accident we assist him.

17,727. Do you hold the surface land or merely the minerals?—Merely the minerals.

17,728. Then the houses of the miners and the cottages of that sort are held under the surface landlord?—No; some of the houses belong to the miners themselves, and the others belong to proprietors in the neighbourhood; a good deal of the land here is let to the miners as accommodation land; the miners and those who are married more especially are fond of a little land, and have one or two cows.

17,729. Are the leases from year to year at rack rent, or for a term of years?—From year to year.

17,730. Will they build a house upon a lease from year to year merely?—No; but the house is bought; there are a great many cottages where there is no land; perhaps they have saved a little money, and they either build a house, or buy one, or perhaps it has been left to them by their fathers.

17,731. Do they buy the freehold of the land upon which they build?—It is copyhold or lease, with some old house, or something of that sort.

17,732. A miner building a house must have possession of the freehold of the land to build it upon?—Yes.

17,733. How does he get it, by purchase?—By purchase; some of the miners have land of their own as well, just a few acres.

17,734. (*Mr. Holland.*) Freehold?—No, copyhold.

17,735. (*Sir Philip Egerton.*) Do the company encourage sick clubs, or clothing clubs, or anything of that sort?—In Arkindale they do as respects clothing clubs, and there is a very old custom here that we generally give the washers a flannel petticoat once a year. They usually make an application at the beginning of the winter, and it is generally given to them.

17,736. With reference to education, do any of the companies take steps for providing schools for the young persons?—We subscribe to the schools; we are very well up in the neighbourhood for schools.

17,737. (*Mr. Holland.*) Are they National Schools which you subscribe to?—Yes; under Government inspection.

17,738. (*Sir Philip Egerton.*) But you find great difficulty in keeping the boys in school longer than ten years old I suppose?—Yes.

17,739. How long will they sometimes remain in school?—They will remain longer, perhaps till 13 or 14.

17,740. (*Mr. Leveson Gower.*) Do the parents contribute to the school?—They do.

17,741. What amount?—2*d.* a week, perhaps.

17,742. The miners are generally a saving class, are they not?—Yes; a large number of them have money in the savings bank, and they are a saving class.

The witness withdrew.

Mr. Reuben Atkinson examined.

Mr. R. Atkinson.

17,743. (*Chairman.*) Of which mine have you the management?—Arkindale.

17,744. Are you one of the under ground managers?—Yes.

17,745. Have you worked as a miner yourself?—Yes.

17,746. How many years?—Nearly 30.

17,747. And how many years as an agent?—Ten, come June.

17,748. At what time did you begin to work?—At 12 years of age.

17,749. Did you ever work in any close places ?—Yes, I used to work in close places.

17,750. Did you ever suffer from it ?—I do not know that I did.

17,751. You have no difficulty in breathing now ?—A little at present, but not much.

17,752. Do you think that that does not arise in any way from your previous work ?—I do not know that it does.

17,753. Have you had it long ?—No, not to say long. I never suffered very much from it. I am not so good, in my wind, as I used to be.

17,754. You do not think that that has arisen from your having worked ?—No, I do not think that it has.

17,755. Did you ever know any man suffer from working ?—I think that they have all suffered from it in the way of breathing, or something of that sort.

17,756. Was that from the air or the dust ?—That I cannot say; it might be from the air or it might be from the dust, or partly both, I think.

17,757. Before you left off working, you did not feel anything in your breathing ?—I was not so capital then as I might have been. I was about 42 when I gave over.

17,758. And you began then to fail a little ?—I felt a difference in my breathing from what I was when a young man, and if I had never been in a mine I should have done that I think.

17,759. Did you ever consult a doctor about it ?—No, I never had any need of that.

17,760. Could you climb up the stemples as quick as before ?—I could climb up the stemples pretty quick, but not so quick as I could when I was 25 years of age.

17,761. Would you rather climb up stemples or ladders ?—Stemples.

17,762. It is more exertion to come up stemples, is it not ?—I do not know that it is.

17,763. Have you ever tried the ladders ?—Yes, we tried ladders in mines which I wrought; one place was at what we call Wesher Green Level, but I did not like it at all, it was too perpendicular.

17,764. You think that if ladders were put in the men would prefer the stemples to the ladders ?—Yes, I believe that they would. We have had ladders, and the men would as soon have stemples as the ladders.

17,765. (*Mr. Leveson Gower.*) Did they give over the ladders ?—No; in some places they had not been put in at all. There is only one place where they have been put in, and they never complained between the stemples and the ladders; it never made any difference. I like the stemples quite as well as ladders myself.

17,766. (*Chairman.*) Have you any very wet places in your mine ?—None particular. We have one mine which is rather wet when it comes heavy rain, or anything of that sort, and in a rise which we have in Danby it is a little wet sometimes, but otherwise we have no particular wet places.

17,767. Have the men ever to work in a wet place ?—Sometimes they have and sometimes not.

17,768. In Danby they have to go through wet at times ?—Yes.

17,769. Do they work all the time in their wet things ?—They never get them wet. If it was so very bad they would not go at all, they would turn back, and would not get a wet skin.

17,770. (*Mr. Holland.*) Did your complaint at first come on very slowly ?—I have no complaint on me, except when I am fatigued.

17,771. When did you first perceive that you were that way ?—A few years since, it may be ten or a dozen years since. When I was climbing up a hill, or a rise or anything of that sort, I was rather put out of breath, that was all.

17,772. I suppose you hardly know when it began ?—No.

17,773. Is it a feeling of tightness ?—No, I do not feel any complaint at all.

17,774. You have no pain from it ?—No.

17,774. No spitting ?—No.

The witness withdrew.

Mr. ROBERT LOWES examined.

17,775. (*Chairman.*) You are agent for one of the mines ?—Yes.

17,776. Which ?—Westswaledale Mine at present.

17,777. Have you many men ?—We have not any at present; the mine is abandoned, and has been for about 15 months.

17,778. Have you been long agent there ?—Twenty years altogether.

17,779. (*Mr. Kendall.*) Have you any agency at present in any mine which is working ?—No, I am under the company still; the engines are going, and I attend to looking after them, and that sort of thing, but there are no men underground.

17,780. (*Chairman.*) Are you acquainted with many of the mines in this district ?—Yes, a great many of them.

17,781. Have you ever been where the air has been bad ?—Yes.

17,782. How have you ascertained that ?—The candles burn very badly when the air is bad, and you feel your breathing rather heavy; it produces a sort of lassitude, a weakness of system, and also headache.

17,783. Have you known any cases where the men have suffered permanently from it ?—No.

17,784. (*Mr. Leveson Gower.*) How do the miners support themselves after they have been obliged to leave off work ?—They get parochial relief.

17,785. (*Mr Holland.*) Do not they take to any other employment ?—Sometimes; they will get day work now and then where they can.

17,786. (*Mr. Leveson Gower.*) They get out-door relief, so much a week ?—Yes.

The witness withdrew.

Mr. GEORGE A. ROBINSON examined.

17,787. (*Chairman.*) Your father was for many years connected with mines ?—Yes, for 50 years.

17,788. He was a medical man formerly ?—Yes.

17,789. And you have lately taken the management ?—Partly so of the Crown Mine in Grinton Moor, and Apedale, under Lord Bolton.

17,790. You consider it a great advantage to work the mines by means of the horse levels ?—Yes, compared with any other system it is better in every way, both for the health of the men and for ventilation, and for convenience of working and safety as well.

17,791. And economy in getting rid of the water ?—Yes, that is where we have the great advantage. We also find the advantage of levels in the supply of water for dressing the ore and for the smelt mills.

17,792. The level gets rid of the water, and turns it to the use of the mill ?—Yes.

17,793. And also it is the best means of ventilation ?—Yes, the water blast. At one place in Old Gang a cross-cut of between 300 and 400 fathoms was aired entirely by a water blast.

17,794. A water blast is the best means of ventilation ?—Yes, the best which we have; we have nothing to be compared to it.

17,795. Which do you think is the best means of ventilation, the driving in air, or extracting the foul air?

REETH.

Mr. G. A. Robinson.

3 March 1863.

—Are you speaking of a leading forehead or anything of that kind; do you mean when we are driving an adit in a leading forehead?

17,796. Yes.—I should drive out the air; I would make an alteration in the way that it is generally done. I would have my machine with the water blast placed in the forehead, and not at a distance from it, and I would have a double way-gate to force the air out in that way; I mean a double waygate for the air, and not for the men. I would have it bratticed off a little bit.

17,797. Then you must make your level either wider or higher must you not?—No, I do not think there would be any occasion for that. We tried it in one place. I would conduct it by means of wooden troughs or launders; I would fix that, according to the nature of the air, either at the top of the drift or the bottom; I would conduct it where there is choke at the top.

17,798. (*Mr. Holland.*) You mean a wooden air pipe?—Yes; I should like to see all our way-gates made higher. In the two chief levels which we put on lately, instead of carrying them six feet we carry them eight feet now, and from five to six feet wide, and we find that our mines are aired better, and that the men can work them cheaper in that way than they could before. We meet with so many more flats in working them in that way.

17,799. (*Chairman.*) Can you describe the working of a mine where the working had to be abandoned in the plate?—That was in a mine that we had driven up in the 12-fathoms lime, and we had to sink from that 14 fathoms, when we came into another lime, and then we wished to make another communication for air. When we came into the plate above the second lime our men could with very great difficulty get through it; they did manage to get through it, but the air was so very bad (it was to let off the water), that after we had proved that there was no water I would not allow them to go on any more. I found that in less than a fortnight it had injured their health severely. Our agents were in the other day and could not get a candle in at all; they have sometimes been obliged to put five or six candles together to see at all.

17,800. (*Mr. Kendall.*) How far are they from any opening?—The first level is just about a quarter of a mile long, and then they are 16 or 18 fathoms down; then another adit is driven about 36 fathoms, and a "rise" of six fathoms.

17,801. You had artificial means of ventilation?—Yes, we had both the water blast and the windy king at work, but all would not do.

17,802. (*Mr. Leveson Gower.*) Did the men themselves complain?—Yes; but they never care so long as they can earn extra wages; they do not care what they do.

17,803. (*Sir Philip Egerton.*) In which mine was that?—In Apedale; you would see the same sort of plate at Hurst, at Prize.

17,804. (*Mr. Kendall.*) Did you ever see a place where it was possible to work at all that a miner would not go in if you would pay him for it?—Never, except one, and that was for water—a place that my father drove up to let some water off, and there was such a great lodgment of water that the men were afraid of it, and he had to promise, if they required it, to go with them; they were not afraid of the air. The men complain, but they know that if it has to be done it has to be done, and they go and do it.

17,805. (*Mr. Leveson Gower.*) I suppose they complain more in order to raise the wages than to get out of it?—No, I do not think that our men are of that sort; they have a right to complain; but then they know very well that we never do a thing of this sort, except for opening out other workings, so that they will make sacrifices.

17,806. (*Mr. Holland.*) Will not men prefer a well-ventilated place even if the wages do fall?—Yes; the men will tell you that they will sooner work for 14*s.* a week in a well-aired place than they would work for 1*l.* in a badly aired place.

17,807. Will they act upon that?—Yes, and they will work eight hours a day in a well-aired place sooner than they will four in a badly aired place. I am wrong about men refusing to work. Some years ago some men did refuse, and my father could only get one man in the whole of his employ to do it, but he and his son did it.

17,808. (*Mr. Kendall.*) Did they suffer by doing it?—No, I do not think they did. They lived near the place, and they used to go and make their hole, and then fire it and come out again, and wait till it was cleared off.

17,809. (*Chairman.*) What do the men now earn generally?—The mines are poor. In some of the mines they will average about 10*s.* a week, in some about 15*s.*, and in others from 16*s.* to 18*s.*; in one mine I consider that the average is about 10*s.*

17,810. Why is that?—Because they have too great partnerships. I consider that to be one of the great faults in mining.

17,811. Can these men who merely earn 10*s.* a week on the average maintain their families properly upon that sum?—No.

17,812. Can they get the proper food for the hard work?—They get it, but they cannot pay for it.

17,813. Do the miners live well upon the whole?—They do not live as they ought to live.

17,814. Do they consume much animal food?—Yes; a fair proportion of that, but they do not use it in the best way, they do not understand cookery.

17,815. Are they fond of having good dinners once now and then, and then living very moderately afterwards, or how; for instance, will they have a very good dinner on a Sunday and stint themselves on other days of the week?—No, they do not do that, but supposing that a man gets what we call a hit, if he makes an extra amount he lives like a fighting cock as long as it lasts, especially in rich cakes, and all that sort of thing, you would be surprized to go and see them sometimes in that way, but they are steady livers on the whole as far as regards meat.

17,816. Do they drink much?—Not one fourth of what they did.

17,817. They are very much improved?—Very much indeed.

17,818. Are there many teetotallers amongst them?—Yes.

17,819. Do you attribute much of that to teetotalism?—Almost entirely to that and the Wesleyan Methodists. I attribute the entire improvement in morality to the Wesleyan Methodists and teetotalism; but the Church of England has lately paid more attention than before to education.

17,820. Is Wesleyan Methodism a new importation in this neighbourhood?—No; it was started by John Wesley: John Wesley preached in this neighbourhood; we have four and five generations of them.

17,821. (*Mr. Holland.*) Perhaps Methodism has made a large increase of late years?—No; you may call it the religion of the Dale.

17,822. Has it been so for 50 years?—Yes.

17,823. Then that will not have produced much change in the habits of the people during that time, because the effect was produced before?—I do not say that there is as much difference produced in the health of the people as there might be, it is a mistaken notion when people suppose that the health of the people can be much affected in the present generation. I can give you instances of families in one dale, especially, where their forefathers have been drinkers for generations, and where if any of the family start to drink they have *delirium tremens* almost as surely as they start; it must take generations to get it back again, to make them anything like what they ought to be, and you will find them of lesser growth, quite different from what the men are in the adjoining dale.

17,824. You think that they feel the habits of their forefathers?—"I will visit the sins of the fathers upon

the children unto the third and fourth generation." You have it there I think.

17,825. (*Chairman.*) How often are the men paid here?—Every month. I believe that one of the great advantages which we have had here, has been in making our pays monthly, formerly they used to be quarterly. When they were made once a quarter the men were over head and ears in debt, and on the pay days they would meet and they would drink for a week or a fortnight before ever they struck another bat.

17,826. Are the pays made at public houses?—No; another advantage is that all the pays now, without an exception, are made apart from public houses; I believe that the whole of them are apart from them.

17,827. (*Mr Holland.*) Is each man paid separately his full amount?—They are paid in partnerships and they divide.

17,828. Do they divide at public houses?—No.

17,829. How do they manage that?—In some places they will go to the public house but in my own case I always have sufficient change sent up to each of the mines so that the men have no occasion to go for change to any place, they can divide the money there and then.

17,830. Is there any rioting on the pay day?—No, I never see anything of the kind; there is a little extra drinking higher up I believe, but not of any great consequence.

17,831. (*Mr. Leveson Gower.*) Was there plenty of school accommodation before the building of the new schools?—Yes, very good schools; I scarcely know a child but who attends school of some sort, and I know nearly all the children in the Dale.

17,832. Are there any night schools?—I have one of my own for a lot of lads that I have in connection with a brass band which I have, about 30 of them; most of them attend the night school, I have not heard of any other night schools.

17,833. (*Mr. Holland.*) Does the brass band work well?—Yes.

17,834. Is it beneficial to the rest of the people as well as to the musicians themselves?—I think it is in this way, they are all teetotallers and I think that it induces many of the parents to give up drinking when they see their children trained in that way. Most of my band, although they are young, are members of the Wesleyan Society as well, they have become that since they entered the band.

17,835. And the band is a source of amusement to the whole village is it not?—Yes; we have five bands in this Dale; they are very musical.

17,836. (*Chairman.*) With reference to the black spit, do you think that there is anything in the shale or plate which is deleterious in itself?—I imagine that it is the sulphur as much as anything.

The witness withdrew.

Adjourned to To-morrow at Leyburn.

LEYBURN.

Wednesday, 4th March, 1863.

PRESENT:

The Right Honourable Lord KINNAIRD, K.T.	The Honourable F. LEVESON GOWER, M.P.
NICHOLAS KENDALL, Esq., M.P.	P. H. HOLLAND, Esq.
Sir PHILIP GREY EGERTON, Bart., M.P.	

The Right Honourable Lord KINNAIRD, K.T., in the Chair.

Mr. THOMAS EDMUNDSON examined.

17,837. (*Chairman.*) You are, I believe, a medical practitioner residing here?—Yes.

17,838. Have you been here long?—I should think about 40 years.

17,839. During that time have you had much opportunity of seeing any cases of miners suffering from disease?—I believe that I have seen as much as most people. I attended the Keldheads club; I have found this morning the old agreement.

17,840. You attended that club as the medical practitioner of the Keldheads mines?—Yes.

17,841. Do you continue to do so now?—No, it was given up.

17,842. They had a club there?—Yes.

17,843. What did the men pay?—About 4*s.* 6*d.* a year, and the company gave 5*l.*

17,844. And for that did you attend them for sickness or for hurt?—Everything that required medical or surgical aid.

17,845. That went on for how long?—Four or five years. The men in the smelting department would not submit to be treated in the manner or put under the regulations which I wished. They were the first to retire, and they got a fresh overlooker and he and I did not quite agree. I have part of them yet. Then it went on and the partners withdrew the 5*l.*, and after that the men just did as they liked.

17,846. Since that time have you had miners come to you?—Yes, up to this time.

17,847. Have you observed any particular disease among miners?—I have observed the lungs being affected from breathing the bad air.

17,848. Do you think that that is from the want of circulation in the air?—It is from the want of circulation, and from the place being so close that the carbonic acid gas accumulated, and they had to breathe it over again.

17,849. Have you had any case under treatment at the beginning when a man was first affected?—Yes, numbers; but I generally wished the partners (some men will bear it a great deal better than others) to withdraw them, and put them in a more airy place. There are some who have died, and some who are now asthmatical, as they call it, and they cannot follow any employment.

17,850. Do you think that if they were put into a place with better air they would then completely recover?—Yes, if the lungs were not injured.

17,851. Is it an asthma which is peculiar to miners who are affected with it, or not?—Yes, I believe that after continuing for a length of time the lung becomes hepatised; that is to say, that it is like a piece of liver, that the air cells completely disappear, for with the stethoscope you cannot hear any circulation of air through the air cells. During the time that they are in this air and afterwards, what they expectorate is completely black, and that deposit most likely takes place in the air cells.

17,852. Have you ever observed a case when this black expectoration has continued after a man has left the mine?—Not for any length of time.

17,853. Do you think that this black expectoration arises from the dust?—No; I believe that the blood not having a quantity of oxygen becomes carbonated.

LEYBURN.

Mr. T. Edmundson.

4 March 1863.

that there is a quantity of carbon in it, and that that carbon is deposited in the air cells ; in the secretion from the blood.

17,854. You consider the black sputa a secretion from the blood ?—Yes, I believe it to be so ; and if they are breathing air which has more than its share of carbonic acid gas, it may be deposited as well the other way.

17,855. Are the mines dusty at all ?—Some of them are where they have a great deal of hewing.

17,856. Do you see it worse for dust in any particular strata than in others ?—In the grit.

17,857. That is the worst ?—That is the worst.

17,858. Is there any plate in these mines ?—Yes, there are layers of plate in most of them.

17,859. But the grit is the worst ?—I fancy that it is the worst because it is the dustiest.

17,860. Have you been under the ground yourself? —Yes, I have had too much of it; I have worked a mine in the neighbourhood.

17,861. Which mine is that ?—It is not a mine which you know much about ; it is in the Bellerby Liberty, adjoining Lord Bolton's.

17,862. Is it worked now ?—No, I have not worked it ; we are waiting till the dry weather sets in ; we had it filled with water.

17,863. Have you been in a mine where candles will not burn ?—Yes, very often. I have sat with them for hours, and a man will live for some time where a candle will not burn ; but we have to slant the candle; the air is very annoying.

17,864. Did you feel any effect yourself ?—No. When I get a bad cold I am troubled with asthma, or when I get into certain kinds of air, such as the fumes of rosin or anything of that sort ; but I can stop in a mine as long as any of them, when the air is so bad that a candle will not burn.

17,865. Do you think that the ventilation is much improved ?—I think that it is ; it is improved much in the smelting, and the managers take a great deal more pains to get their men better air than they used to do.

17,866. Have you any men now that you are attending who are suffering from this disease?—Not at present, I think.

17,867. Have you ever traced a man's illness to a particular level or a particular forehead where he has been working ? — I have known that he was working where there was not sufficient air, where the air was bad, and that it affected his lungs, and that he spat a black secretion from that. When that club was going on, the men when they ailed anything came direct because they had nothing to pay extra, and of course when they had medical assistance early it did not go for that length of time.

17,868. Then it is of importance that they should apply to the medical man at as early a date as possible when they feel affected ?—As soon as they feel it.

17,869. What are the first symptoms ?—Difficulty of breathing, and the features of the face when they come out are purple and rather swelled ; but after they have been out for two or three hours and have got a quantity of fresh air that goes off.

17,870. Is the stomach affected ?—The liver and stomach; the liver is generally gorged. When the lungs do not do their duty, and do not get fresh air, it throws a quantity of work on the liver and other parts ; indeed if the lungs cannot admit the air the liver becomes gorged with bile.

17,871. (*Mr. Holland.*) What direct evidence have you that the liver becomes gorged ?—It is enlarged.

17,872. Can you feel it enlarged ?—Yes ; and you can feel it tender, and you can see that the motions have not the proper quantity of bile in them.

17,873. Is that an early symptom in this complaint ? —It is ; the first and prominent symptom is difficulty in breathing, then flatulence of the stomach and disorder of the liver.

17,874. Is the complaint which you speak of as miners' asthma common among the miners ?—It is frequently seen.

17,875. Their complaint is generally of the digestive organs, and not of the lungs ?—Yes. If you are speaking of the smelters.

17,876. Have the smelters a disease of the lungs peculiar to themselves ?—I think not. It generally affects the bowels in the first instance ; they complain of the bowels being stopped, and they say they are "bellowed." The obstinate costiveness will last for a week or ten days, and they die if not relieved. I have recovered two cases which had been attended for eight or ten days by other medical men, by introducing the tube of a stomach pump 12 or 18 inches long up the rectum, and throwing up at the least three pints of liquid; repeating it till the bowels were relieved. Repeated attacks will end in paralysis.

17877. You are now speaking of the smelters ?—Yes.

17,878. Have the miners anything of that sort ?—The miners who do not come into the smelting house are not under the affection of the fumes of lead.

17,879. They have no colic, have they ? — They have no colic.

17,880. Have they much disturbance of the digestive organs ?—Much.

17,882. What disturbance of the digestive organs have the miners ?—Great flatulence of the stomach and torpid secretion of the liver.

17,883. Is it general dyspepsia ? — General dyspepsia.

17,884. As an early symptom ?—Yes.

17,885. That is before the lungs are affected ?—That is before the lungs are violently affected.

17,886. Do you attribute that disturbance of the digestive organs to a previous diminution of the respiratory function ?— I fancy that it throws additional work upon the liver, and that the blood which goes through the liver, which ought to have the effects of oxygen in the lungs, does not get it. I should think that the liver prepares the blood (that is Liebig's idea) for going through the lungs.

17,887. You agree in the general opinion that the deficiency of the respiratory function is a cause of indigestion ?—Yes.

17,887*a*. You spoke of their being an absence of respiratory murmur in the lungs in the miners' complaint ; is that an early symptom ?—No, that is when the asthma has set in some time.

17,888. In what part of the lungs is the respiratory murmur most absent ?—The higher part.

17,889. Do you find that the higher part of the lung is more affected than the lower ?—In some cases it is one and sometimes the other, and sometimes both.

17,890. In which is it most frequent ?—The left lung.

17,891. And the higher lobe ?—Yes.

17,892. You are well satisfied of that, are you ?—Yes.

17,893. Your supposition is that the air cells are clogged ?—Yes, with deposit.

17,894. Have you ever had a post-mortem examination ?—No.

17,895. You are well satisfied that the air cells get clogged with carbonaceous matter ?—I go from the air not circulating in them, from the difficulty of breathing, and from the sound.

17,896. As I understand you, instead of being separate in the form of carbonic acid it is separate in the form of solid carbon ?—Yes.

17,897. That is your hypothesis ?—That is my idea.

17,898. That the defective respiration prevents the separation of carbon in the form of carbonic acid, and that it is secreted in the form of solid carbon ?—Yes.

17,899. And that hence arises the black spit ?—Yes, and that the carbon is not neutralised by the oxygen in the lungs.

17,900. Is this complaint, the miners' consumption, peculiar to miners ; do you ever see it among others who do not go down mines ?—I do not. I have seen

cases where there was difficulty of breathing where there has been congestion of the lungs.

17,901. Is the disease among miners a peculiar disease, or is it only an aggravation of what is common among other people ?—It is an aggravation of what is common among other people where they breathe bad air.

17,902. Do you think that it is produced only by breathing bad air?—No, not that particular effect; you have not the black spit.

17,903. What disease which affects ordinary people does miners' consumption most closely resemble ?—Congestion of the lungs.

17,904. Not bronchitis or any inflammatory affection of the lungs?—No, it is congestion of the lungs.

17,905. Have you noticed any cases in which there has been a marked thickening of the bronchial membrane ?—No.

17,906. For instance, where there have been rough sounds of the air passing through the bronchial tube ?—Yes.

17,907. Is that a common symptom?—Yes, when they get very bad.

17,908. In most cases ?—In most cases when they get very bad.

17,909. Is it an early symptom ?—No.

17,910. When does that appear?—After the air cells get nearly clogged up.

17,911. I am speaking now of symptoms of a thickening and therefore a contraction of the bronchial tube independent of the air cells ?—You mean a thickening of the lining ?

17,912. Yes ?—That will occur with congestion.

17,913. Or with inflammation ?—Yes.

17,914. Is it a common symptom ?—Not till they get very bad, or have catarrh or violent cold along with it.

17,915. After these men get their lungs decidedly affected, and they leave their employment, do they recover again ?—Partially, but never to get cured.

17,916. Does the disease cease to advance?—It seems to stop.

17,917. Does it certainly stop?—It stops for a time; if they get cold or any inflammation, or any congestion, of course they do not feel so well as a man does with sound lungs to bear it.

17,918. Has there been any marked change in the prevalence of this disease of late years?—There has not been so much of it.

17,919. Is there a marked diminution of it ?—There is.

17,920. Do miners live now several years longer than they did 20 years ago ?—They are more healthy a good deal.

17,921. They live to a later age ?—Yes.

17,922. Do the majority of miners get this disease at some time or other ?—No, unless they are working in bad air.

17,923. Do many miners escape altogether?—Yes.

17,924. They get even to advanced life without it?—Yes.

17,925. What proportion of miners do you think get the complaint; say miners of 40 years of age ?—Some of them will go through the natural life of man without it.

18,926. Taking a number of miners at 40, what proportion of them would have the complaint ?—I do not know.

17,927. Three fourths ?—Not so many as that; not so many as one fourth would have it; it all depends upon the place that they are working in. If they have pretty good air they will go in for four or six hours, and they will come out and ail little or nothing.

17,928. (*Mr. Leveson Gower.*) Are many of the miners teetotallers?—A good many of them.

17,929. About what proportion should you say?—I do not know; they have increased very much.

17,930. Have you observed that teetotallers are equally liable to this disease as those who are not so?—I should think quite so.

17,931. It makes no difference ?—No.

17,932. (*Sir Philip Egerton.*) Is the general health in this district good; is it a healthy situation ?—It is a healthy district.

17,933. I mean exclusive of the miners?—Yes.

17,934. What are the prevalent diseases amongst the poor here?—They generally have bronchitis and disordered stomach and liver.

17,935. (*Mr. Holland.*) From catarrh?—From catarrh.

17,936. (*Sir Philip Egerton.*) Is there much consumption amongst them ?—Not a great deal.

17,937. Do you find that persons who are of a phthisical diathesis are more liable to catch asthma than strong constitutions?—I should think that they are.

17,938. In those cases is the ultimate result tuberculosis or hepatization as you have told us?—If they are scrofulous they will have tubercles.

17,939. Have you had many cases of tuberculous disease among the miners under your care?—I have; particularly those of a light complexion, and fair skinned.

17,940. You think that those are more liable to this affection than the others ?—Yes.

17,941. Can you give us any estimate of the comparative length of life between the miners and the other inhabitants of the district ?—The miners do not live so long, but it all depends upon the healthy state of the place in which they work. I think that if the air was free from dust, and they were not exposed to water dropping on them during work, they would live quite as long as any other inhabitant, barring accidents.

17,942. In your long practice do you think that you can trace any amelioration in the length of the life of the miners ?—No.

17,943. Has there been no amelioration in the ventilation in the mines, for instance ?—They have taken a great deal more pains to keep the mines ventilated by conveying air and conveying water and other things there to get a full quantity of oxygen in.

17,944. Has the result of that been an improvement in the health of the miners?—Yes. When I have attended them where the air was bad I have generally recommended them, and wished them to carry in some quicklime and spread it on a board or on a tray, and it seems to absorb the carbon and form carbonate of lime (chalk); and, of course, if it did that it left more room for other gases; and I think that it is a very good thing.

17,945. Is there much carbonic acid gas generated in the mine, or is it merely from the absorption of the oxygen ?—It is more from the men breathing, and not having a quantity of oxygen to take off the carbon.

17,946. Are there no beds which give off noxious gases in these mines ?—I do not think that there are any here.

17,947. (*Mr. Holland.*) Is there any excess of dry dust among the miners ?—No; I do not think that there is.

17,948. (*Sir Philip Egerton.*) You have told us that in cases of incipient disease, you have recommended a healthier position in the mine ?—A change of place. I have recommended the agents to let them have an outward place for a while, and then put them where there was better air than the place they had been occupying.

17,949. Have you found a disposition on the part of the agents to co-operate with you ?—They generally have done so.

17,950. (*Mr. Kendall.*) Have you ever found any difficulty ?—I have found difficulty. I have mentioned about the club being broken up. I wished the men who were smelting or working in dusty places to wear respirators, and to attend to their bowels regularly once a week with a little calomel and colocinth or something of that sort, to keep the liver in order, and there was a rebellion about that.

17,951. I refer to the fore-heads where the air was bad; did you ever know an agent refuse to change parties ?—No; the parties were changed.

17,952. On your recommendation ?—Yes.

17,953. They were always changed ?—Yes; they were all ready enough to change.

The witness withdrew.

Mr. Jonathan Coatsworth examined.

Leyburn.

Mr. J. Coatsworth.

4 March 1863.

17,954. (*Chairman.*) You are manager of the Keldheads Mine ?—Yes.

17,955. That is under a Leeds company ?—Yes.

17,956. How many men have you altogether working underground in the different levels ?—There are about 62 working in this part of the ground (*pointing to a plan*), namely, at Keldheads, and there are 18 at Ashbank, that makes 80, and we have upwards of 20 at different places upon the Moor, and opposite side of the valley; altogether it makes somewhere near 100.

17,957. How many levels are you working on the Keldheads Mine ?—We have one at this place (*pointing to the plan*), and one below at Ashbank.

17,958. Are you working below that level ?—Yes. This (*pointing to the plan*) is what we call Keldheads bottom lime, and upon this plan (*producing another plan*) you will see the same limestone, and there are beds below.

17,959. The Ashbank level is several fathoms below the other ?—Yes, 40 fathoms below the other.

17,960. How is the water taken from the Ashbank level ?—It passes out at the level mouth.

17,961. Is there any accumulation of water between the two levels ?—Yes; in Keldheads bottom lime we work it from the high level, and we have a pump perhaps 50 yards from the surface at Keldheads.

17,962. That is worked by a water-wheel ?—Yes.

17,963. Ashbank level is very wet, is it not ?—Yes, it is a very wet level indeed.

17,964. Do you give the men any waterproof clothing ?—Yes; the company have found them with a sort of glazed jacket to screen them from the water as much as possible.

17,965. But I suppose that the men cannot help getting wet going in ?—They cannot help it.

17,966. Do you see any difference in the health of the men who work in a wet mine compared with those who work in a dry mine ?—I believe that the men working in wet places, provided they do not stay too long, enjoy better health than the others because the wet settles all the dust; if they do not stay to get cold, I believe that it does their lungs less harm than in dry places; where it is wet they do not stay long hours; as soon as they get very wet they go home, let it be when it will.

17,967. How many hours do they work ?—Six hours is the usual time for working.

17,968. But they do work less ?—Yes; at the end of three or four hours they generally leave when it is very wet.

17,968*a*. Do they change their dresses when they come out of the mine, or go home in their wet dresses ?—They generally change.

17,969. Have you a changing house ?—Yes, a sort of lodge and a fire in it at the level mouth; they leave their wet clothes there and have dry ones to put on.

17,970. The principal level on the Keldheads Mine is ventilated; by carrying on a parallel shaft is it not ?—Yes, by driving a parallel level.

17,971. Is that along the lode ?—Yes, it is all in the vein. (*The witness described the same upon the plan.*) There is one level 10 fathoms above the other, and we have a rise up into the top level. From that there is a main level continuous, and we work Ashbank on the same principle as we work the other; we have rises between the levels.

17,972. In driving a forehead, how far is the end of this air level from the point where the men are working before you communicate ?—There are eight men working here (*pointing to the plan*); they are working in the air course, and they begin at the air course.

17,973. How far is the end of the air course from the forehead where the men are working ?—It is abou 15 fathoms; and at the end of every 20 fathoms I put up a rise.

17,974. (*Mr. Kendall.*) When you get in about 19 fathoms, before you have your rise, what is the general state of the air ?—It is not bad 19 fathoms from where there is a good current; the men take no harm if it is only 19 fathoms and a good level.

17,975. You communicate at every 20 fathoms ?—Yes.

17,976. Just before you communicate is the air very bad ?—It is not.

17,977. Dou you use any artificial means to throw the air in there just before you communicate ?—At Keldheads we have a water blast driving regularly.

17,978. (*Chairman.*) But not in that level ?—Not in this level; it is a new place, and we have never yet found the necessity of having one.

17,979. You depend for the air there upon the air drift ?—Yes.

17,980. It is a narrow vein in which the men are working ?—Yes, but they take the main level four feet wide and six feet above rails; and it is not a little place.

17,981. What is the size of the air drift ?—Six feet high by about three feet wide. The vein is generally about two feet wide, and we make that drift about three.

17,982. There is not a strong current of air at that point where the air drift is brought out ?—Not very strong; it will draw your candle gently away.

17,983. In your bargain with the men, are they obliged to remove the deads ?—Yes; there is a man appointed to take the refuse away, but of course they pay for it, and it is generally taken away just as they work it.

17,984. But sometimes there is an accumulation; there is too much ?—That sometimes happens when the working is rather softer than usual, and sometimes when it is rather harder than usual, the man that that takes away the stuff can hardly get sufficient, and it is kept clear enough, When it is soft it perhaps accumulates a little. Where there are more partnerships than one they cannot all get their work away at one time.

17,985. Therefore the deads accumulate ?—Yes, during that time.

17,986. That to a certain extent injures the ventilation in the forehead ?—Yes, it injures ventilation certainly; it is a great point to work every mine clean in order to keep the air good.

17,987. In the Keldheads Mine, are the workings very often soft, or are they generally hard ?—They are what we consider in a medium way for that. I have seen both harder workings and I have seen softer.

17,988. Does it often happen that the men are working in the soft, and that there is an accumulation of deads ?—No; it very seldom happens that there is any accumulation; that is a great point of success in any mine to keep it clear of work. If the men are smothered up with work it is a loss to the company. I take good care of that on the company's account, because the men suffer by it, and they cannot prosecute their work so well when they have work in as they can when it is clear.

17,989. Will you describe the water blast ?—It is simply a column of water in iron pipes, and at the bottom of the pipe a small hole is drilled about a quarter of an inch in diameter, and it will not spread much more than the breadth of my finger as far as the window, and that drives a current of wind into a cistern. We have that cistern so constructed that the water falls out at the bottom and the air passes into the pipes at the top; the pressure will not allow the air to get back, it goes forward.

17,990. It is a very strong blast ?—Yes; the air cannot get back, it must go on. I consider the blast to be very good.

17,991. What is the size of the hole ?—About a quarter of an inch, and with 16 fathoms of pressure; a strong current of water passes through it.

17,992. (*Mr. Kendall.*) What is the size of your pipe ?—Five or six inches in diameter, and the jet is about a quarter of any inch as near as I can say.

17,993. (*Mr. Holland.*) Do you know the quantity of air which it drives in?—No, I cannot say that.

17,994. (*Chairman.*) You let the men down the sumpts by windlass, do you not?—Yes.

17,995. Is there no danger of the rope breaking?—No, not a bit, while the rope is new. It will not break till it gets rotten. After it has been in use for two, or from that to three months, we take it away from there and wear it out in some other place where nobody is working under it, and then there is no danger.

17,996. (*Sir Philip Egerton.*) Are they hempen ropes or wire ropes?—Hempen ropes for common purposes.

17,997. (*Chairman.*) What is the deepest part?—Seventeen fathoms and a half is the deepest sumpt that we have.

17,998. Have you ever had an accident there?—No, no accidents at that sumpt. This is my ninth year, and we have had two accidents, and that is all. One of them was at Bolton Gill. A man had a careless way of proceeding, and he thought fit to go into old ground to strike out some wood to put into his own place, while cart loads upon cart loads were lying at the level mouth for the men to take in, but rather than take that trouble he knocked out some old wood from an old working, and when he struck it out of course the top came in, and he fell back, and dropped into a rise. It was only a fathom or two in height, but he broke his back, and died shortly after. Then at Cobb's Car another man had drawn six hours at the sumpt; he was about to leave, and fell into the sumpt. Nobody was there but himself, and for that reason we never could account for it. We did not know whether he slipped his foot or not.

17,999. Was the rise by stemples from the sumpt; or what was the way up?—They had a rope. Men were working at the bottom of that six-fathom sumpt. They had just finished their work along a drift when he fell in the sumpt. He had been working the windlass; and nobody was with him. I went up immediately to see him, but he could not speak.

18,000. You have never had a rope break?—Never, where any men have been working under it.

18,001. Have you ever had any accidents from blasting?—No, not one since I came.

18,002. Do you take any particular precautions in blasting?—Yes.

18,003. Are there any rules laid down as to the way in which the men should blast in order to prevent accident?—The principal danger is from firing the powder. Generally if the men are boring in a dry place I get them to take care of the borings of the holes, to fill their holes with fine stuff before they put the needle in, that will not strike fire, and there is then no danger. When they strike fire, it is perhaps from putting in a bit of hard stone; it takes hold of the needle if it is too big, and drives the needle against the sides of the hole which they have drilled, and it strikes fire; but if they put in the small dust it does not take hold of the needle, and is quite safe. We have never had an accident of any sort through blasting, except that in one case some men had a powder bag carelessly lying with a bit of powder in, and they fired it, and burnt themselves a bit. That is two or three years since.

18,004. Is there any difference in the description of rock as regards danger from fire?—Yes.

18,005. Would the small dust from boring from any kind of rock answer for tamping?—Yes, in any sort of rock; it does not matter what kind of dust it is, it will do. When we are working in this black plate (*pointing to the map*) it will not give any fire at all; but either the grit or the limestone will give fire.

18,006. (*Sir Philip Egerton.*) There is a great deal of chert in the limestone?—Yes; it is of a hard texture; some of the limestone gives a good deal of fire.

18,007. (*Mr. Holland.*) You said that the men working in the wet were more healthy than those working in the dry?—So far as their lungs are concerned.

18,008. And you thought that that was because they had less dust?—Yes.

18,009. Might it not be because they work fewer hours?—There may be a little in that.

18,010. They only work about half the time, do they?—As soon as they get properly drenched with water they come out, if it is only after two hours.

18,011. Are you satisfied that the dust is a serious cause of disease?—There is no doubt that it does harm, but what does far more harm than that is the foul air, bad atmosphere; it spoils the blood, and ruins the constitution; that is the worst of anything. Dust has a pernicious influence, but bad gases are far worse than that.

18,012. I suppose that with respect to the water-blast the cost of the water is nothing?—The cost of the water is nothing.

18,013. Have you an ample quantity of water?—Yes.

18,014. And it all runs out without pumping?—Yes; it passes away to the surface again, out at the main level.

18,015. If it had to be pumped again it would be expensive?—It would; but we have not to pump it.

18,016. (*Mr. Leveson Gower.*) Are there several medical gentlemen in the district who attend the miners?—Yes; when they need medical assistance they apply for it to whom they think proper.

18,017. Are the last gentlemen who were examined viz., Mr. Edmundson and his assistants, the only medical gentlemen, or is there any other medical gentleman?—Yes, there are two medical gentlemen at Leyburn.

18,018. Mr. Edmundson told us that there is no medical club now?—There is not.

18,019. You discontinued it?—They had one when I first came here, but it was broken up soon afterwards. The workmen did not agree among themselves somehow or other about it, and it got knocked up.

18,020. You do not think it desirable to re-establish one?—I do not know whether it would be desirable or not.

18,021. Do you recommend men to call in a doctor when they are affected?—I have seen it tried in other districts, and it was generally thought that some of the doctors were not sufficiently attentive; the men were hardly satisfied with the attendance, at any rate.

18,022. You think that the men are better attended without a club than with a club?—I have a little hesitation in saying that, but I think it, at all events.

18,023. (*Sir Philip Egerton.*) How many boys have you in the workings?—I cannot say exactly, perhaps from 30 to 40.

18,024. What duties do they perform?—They dress the ore after it comes out of the mine; that is their employment.

18,025. At what age do they begin working?—From 18 to 20 they go into the mine generally.

18,026. Do you call them boys when they are 18?—They are young men then.

18,027. Have you any boys in the mine of younger age than that?—No; I am not aware that we have one under 18.

18,028. How is your ore brought up?—It is brought out by levels, but we have a lift at Keldhelds by windlass; but it comes up to the main level and passes out at the main level mouth. There is only one entrance to bring it all out.

18,029. (*Mr. Leveson Gower.*) Do not the miners take their young sons down into the mines to help them?—No, not until they are 18, as a general rule. They are employed in dressing at the surface previously to that. We consider that they are better out of a mine while they are young and growing.

18,030. (*Sir Philip Egerton.*) Are there any opportunities of schooling?—Yes.

18,031. What schools are there?—Very good schools at three places.

LEYBURN.

Mr. J. Coatsworth.

4 March 1863.

18,032. To what age do the boys remain at school?—There is a great deal of difference respecting that. When they get to 12 or from that to 14 they generally leave.

18,033. How do they get their livelihood between that age and 18 when you put them into the mines?—The boys who belong to the companies workmen are generally employed in dressing the ore out of doors.

18,034. Is that done in sheds, or in the open air?—At Keldheads a part of them are under sheds, and a part of them are exposed to the weather.

18,035. How many hours a day do they work?—They commence at seven, they have an hour for dinner, and then they leave at half past five.

18,036. (*Mr. Kendall.*) Do you never permit lads to go under ground before they are 18?—They are very rare exceptions, except he goes to blow an air machine.

18,037. What are those exceptions?—When a father wants to have his own son with him perhaps a little earlier.

18,038. I understand that you have 100 men working under-ground under your charge in different places?—Yes.

18,039. Will you give as near a guess as you can how many men in the year out of the 100 who work under-ground you think suffer, even in a small degree, from bad air?—That is a complex question; I do not know how to define that.

18,040. Do you think that five men out of 100 suffer within the year and are incapacitated from working in consequence of bad air?—It is my conviction that every man who works under the surface will suffer a little.

18,041. You think that every man suffers a little?—Yes; that is my conviction.

18,042. At what time of life do you think he begins to show that suffering?—A good deal depends upon what kind of workings he has been in. In the north you may begin to see some symptoms of it in some mines frequently at 30 years of age, and you may see a great deal of it at 40.

18,043. Do you know any men who have worked under you who are at this time in this neighbourhood and who are entirely done up, as far as working goes, who are not 50 years old?—No, not one. We have a great many above 50 working, and they do not seem to be suffering very much.

18,044. Do you know any men at all who have worked with you who are now entirely laid up on account of work?—There is one at Redmire, and the only one, an old man.

18,045. How old is he?—I do not know his age exactly; he is somewhere between 60 and 70.

18,046. You only know one instance in this neighbourhood of a man entirely unable to work in consequence of the miners' asthma?—No; and I believe it is more from an asthmatic affection which he has than anything else.

18,047. Is that asthmatic affection a peculiar one to miners, or a common one?—Some farmers are troubled with asthmatic complaints; men who have never been in a mine are troubled from asthma.

18,048. Out of 100 men that you employ every year, how many do you think are suspended from working in consequence of working in bad air within the year, even for a month?—Not one that I am aware of; we only have a single man off work now out of all that number, and it is a complaint in his spine, so a doctor at Richmond says, it is not from anything else.

18,049. Though there is a marked suffering among miners, yet it is not of a very grievous nature?—No; if you have mines properly ventilated men suffer comparatively little; but if they are badly ventilated men are crushed up and die away when they are 40 or 50 years of age.

18,050. Generally speaking, are the mines in this neighbourhood badly ventilated, or not?—I do not know anything about any but my own, and I consider them well ventilated.

18,051. You said just now that if a man worked in a wet place you considered that, if he changed and did not get chilled, he was working in a better place than a man who was working in a dry place?—His lungs will suffer less, so far as that is concerned.

18,052. Most of those who work in wet places change at the mine?—Yes; when it is very wet, and they get properly drenched. I made a place, and put a stove in, for that purpose.

18,053. How far do they generally live from the mines?—A mile, and two miles, and some of them three miles from the mines.

18,054. Suppose that they are unmarried men, where do they live generally; do they lodge with the other miners, or not?—Unmarried men generally lodge with their neighbours.

18,055. With the married miners?—Yes.

18,056. What do they pay for their lodgings?—I do not know. I never inquired.

18,057. Do you ever go to their cottages?—Sometimes.

18,058. What is the state of their cottages; are they generally cleanly?—Very cleanly and nice.

18,059. Are their bedrooms small, or large?—I do not know.

18,060. You have never gone into their bedrooms to see?—No.

18,061. (*Sir Philip Egerton.*) Do they live pretty well as respects food?—Yes, I dare say they do; the men earn very fair wages, and that places good food within their reach.

18,062. Do they bring their dinners with them to the mine?—They take a little with them.

18,063. Are their cottages freehold, or are they generally leased from the landed proprietors in the neighbourhood?—At Preston and Redmire the principal part of the cottages belong to Lord Bolton, and a great many of the miners have a small portion of land, and keep a cow or two.

18,064. (*Chairman.*) Do they take milk to the mines?—Seldom. Only staying six hours they do not require much; perhaps they may require meat and bread which they put into their pocket.

18,065. (*Mr. Kendall.*) What are the average wages which you permit them to get, 3*l.* a month?—They earn more than that.

18,066. Will they average 4*l.*?—Between 3*l.* and 4*l.* a month, nearer 4*l*; the Keldheads men have done so ever since I came.

18,067. Do they drink much?—No; not very much. If a man contracts an intemperate habit and neglects his employment I turn him away, because, when a man does not come, his partners generally cannot do much, and it loses both their time.

18,068. (*Mr. Leveson Gower.*) Are there many unemployed miners in this district?—I fancy that there are a few further up the Dale; the mines further up are rather poorer than usual.

18,069. You have no difficulty in obtaining labour?—Not a bit; there is plenty of labourers in our neighbourhood.

18,070. (*Chairman.*) Is the air shaft always an up-cast shaft?—Ten or eleven months out of twelve it is; in very dry weather in summer sometimes it draws down.

18,071. And then, till the current has changed, the air is not so good?—Not quite so good for an hour or two while that change is passing.

18,072. Supposing you put a fire at that air shaft, could not you ensure its always being an up-cast?—Yes; I expect we could.

The witness withdrew

Mr. JOHN TATTERSALL examined.

18,073. (*Chairman.*) You reside in this neighbourhood?—At West Witton, four miles from here.

18,074. You have been connected, more or less with mines for some years?—Yes, about 18. I was one, along with other two, that took the Keldheads ground when it was opened.

18,075. West Burton you take a principal interest in?—Yes.

18,076. You remember Keldheads when the men first began to work?—Yes, I have reason to remember it; all the levels were broken in, and we had very rough work indeed in the commencement. It had been worked previously by a company, now working the Sedlingstone mines in the north, and it had been standing some 18 years when we took it.

18,077. While you were opening up that mine the men suffered very much?—We could not let them remain above about 2 hours, from the water pouring down upon them and bad air; but we had none who died, or anything of that sort. They suffered at the time, they were soon right; they did not get what you would call the miners' illness, such as they have on Grassington Moor, they are working there in the grit. We have very little grit work here; the grit work on Grassington Moor seems to affect them much there.

18,078. From the dust?—Yes; we are chiefly in limestone here.

18,079. You consider that the Kelsheads Mine is now well ventilated?—I think so. We took every pains during the time that I was with them to have shafts to the top, and double roads and double air ways, and trap doors, and double sumpts. With the first sumpt which we had, before we communicated with the next one, we had some trouble in driving air down with a fan and those things, but when we had once got a communication and carried a double road, we never suffered much afterward.

18,080. There is an up-cast shaft?—We always had an up-cast shaft.

18,081. Is that affected at all by the weather?—Sometimes the air will go up the shaft and sometimes it will come down it.

18,082. Would it not be advisable if you could always secure its going up the same way?—I think it would be better, but I do not know how we could manage that.

18,083. If there was any furnace at the shaft, do you think that that would do it?—Perhaps a furnace might draw the air, but when it comes down I do not see a very great deal of difference.

18,084. That is only I suppose during the time when it is changing?—When we are going to have a fit of very bad weather, sometimes the air will hang heavy in the mine, though there is a current, it seems to be a heavy atmosphere there immediately.

18,085. I believe that the West Burton Lead Mine is what you are now interested in?—Yes; I am connected with another, a great strong vein which adjoins the Swaledale Mine; it is the high end of Lord Bolton's ground, called Apedale. We are just getting up into the hill, we have only 14 miners at work, but there we are well aired. They have worked the two top beds, as they have done in all this ground, and we rise up and get air at once into the old workings.

18,086. Do you know any mine in that neighbourhood where they were working in the plate, and where they were obliged to stop working?—No; I am not aware of any.

18,087. In the Keldheads Mine is the main level arched with stone?—Some part of it, but not very much.

18,088. Does it require much timber?—A great deal of timber; they use a great deal of timber in the Keldheads Mine.

18,089. In the West Burton Mine do you use timber?—Yes.

18,090. Does it decay much?—No; there is generally water, and we use the root end of larches for the head trees; we have them peeled, and they last a long time.

18,091. Do you think that it lasts longer by being peeled?—We think so; after it has been peeled and exposed two or three months, it gets very hard, and we think lasts much longer.

18,092. There are some other mines of Lord Bolton's are there not?—Yes; there is Wetgroves, but I think they are not getting much ore there at present, it has got a great lot in its time. It is a very singular place, the beds are tumbled down there most extraordinarily.

18,093. (*Mr. Holland.*) You have said that the ordinary up-cast shaft occasionally becomes a down-cast?—Yes.

18,094. Is that in the hot weather?—I think it is generally when there is going to be a fit of wild weather.

18,095. Is it changed by the direction of the wind?—No; I think that it happens when the wind is in all parts, sometimes.

18,096. Is it changed by hot weather?—I have found it generally when it is going to be very wild weather. When I have made these observations I have generally found it so. Sometimes the wind is then driving from different quarters.

18,097. You have not discovered the immediate cause of the change?—No.

18,098. (*Mr. Leveson Gower.*) Do young boys work under ground in your mine?—Not many young ones.

18,099. At what age do they begin?—They will begin, perhaps, at 15 or 16.

18,100. Have you any medical club connected with West Burton?—Not at West Burton. The miners are in some sick societies, such as the Odd Fellows and the Foresters, and those societies, but they have no medical clubs. I think that they had at Kelheads; they had one when I was there, but it was broken up, and whether it is established again or not I do not know.

18,101. (*Mr. Kendall.*) Have you given your attention to any other mines beyond the mines in this district?—No; I do not go out of the district much, except when I am off for a pleasure trip. I am then generally amongst the mines where I go.

18,102. Do you ever go under ground so as to have a comparative idea of the ventilation in other mines, and in the mines in this district?—I have been in some of the mines in Derbyshire, and I have been on Grassington Moor many times.

18,103. In the Derbyshire mines where have you been?—I was once at the Cradge Cliff Mine; that was a very rich mine; it is not far from Matlock.

18,104. Was it worked at all by pumping machinery?—They had a very heavy engine there.

18,105. Did you go under ground there?—Yes; I think that the shaft was 70 fathoms, and the air was then very bad there.

18,106. Was that owing to a bad system of ventilation, or what?—I do not know how they got their air. I saw no appliance; I saw no pipes; they had just one pumping shaft.

18,107. Did you see the miners there?—Yes.

18,108. Did they look unhealthy?—I do not think that they looked so healthy as ours do here, but that is some years ago.

18,109. Do you think that your men here have improved in health a good deal in the last few years?—I do not see they are much different from what they were when we came.

18,110. Taking the health of the agriculturists and of your miners, do you think that there is any visible difference between the two?—Our miners do not look so rosy and healthy as the agricultural labourers.

18,111. Do you think that they live as long?—I cannot speak to that.

18,112. Your general impression is that the miner,

LEYBURN.

Mr. J. Tattersall.

4 March 1863.

though he lives in tolerably well ventilated mines here, still must suffer to some extent ?—I should think that they will not live so long as the agricultural labourers ; that is my impression.

18,113. Take Grassington ; do you think that the mines there are as well ventilated as they are here ; did you go under ground there ?—Yes, at different times, but I thought that they were not so well ventilated as we have them here, and they work in grit there, and it appears to affect the men very early. The dust appears to get on to their lungs, and their wind is bad.

18,114. Then you attribute the difference to the grit, and not to the mode of ventilation ?—I think it is the grit ; the mines are dry and very dusty in the grit ; they are generally hard veins.

18,115. Did you converse with the men at all ?—No, not on that subject.

18,116. (*Mr. Holland.*) Do the miners look older than the agricultural labourers at the same age ?—I should think that they do look older than the agricultural labourers.

The witness withdrew.

Adjourned to To-morrow at Grassington.

GRASSINGTON.

Thursday, 5th March 1863.

PRESENT:

The Right Honourable Lord KINNAIRD, K.T.	The Honourable F. LEVESON GOWER, M.P.
NICHOLAS KENDALL, Esquire, M.P.	P. H. HOLLAND, Esquire.
Sir PHILIP GREY EGERTON, Bart, M.P.	

The Right Honourable LORD KINNAIRD, K.T., in the Chair.

Mr. MATTHEW NEWBOULD examined.

GRASSINGTON.

Mr. M. Newbould.

5 March 1863.

18,118. (*Chairman.*) Will you name to the Commissioners the mines of which you have now charge ?—Sunside lead mines, Stoney Groves, and Prosperous Mine, Forest Moor Mine, and Yorkshire lead mine.

18,119. About how many men have you altogether working underground in Sunside ?—In Sunside we have about 90, and on the surface from 20 to 25, in Stoney Groves and Prosperous 15, in Forest Moor 10, and in the Yorkshire mine 6 ; there have been more but there are only 6 at present.

18,120. Do boys work underground ?—We have not one boy I think under 18 or 19.

18,121. Do they all work at the surface ?—Yes ; any boys that we have.

18,122. Do women work on the surface ?—None.

18,123. About what is the longest level in Sunside ?—A mile and a half.

18,124. Is that the lowest level ?—No ; we have one a mile and a half that lies away to the east of the general mines and we have two other levels each of which will go about a mile and a half.

18,125. Are the levels sufficient for taking off all the water or have you any machinery ?—We have no machinery excepting for below the levels ; we there pump it by a steam engine,

18,126. What are the beds generally in which most of the ore is found ?—In the limestone strata.

18,127. Do you work in the grit at all ?—Not at all in the Sunside Mine.

18,128. Have you many communications with the surface, that is to say, shafts ?—Yes, several.

18,129. Do the men go in by the level or do they go by the shaft ?—They go both ways, by inclines and some nearly perpendicular, and sometimes by the levels.

18,130. Do they go down by ladders or stemples ?—Mostly by stemples at the Sunside Mine.

18,131. Have you any ladder ways ?—None to speak of ; I think that we have not 20 yards of ladders in the whole mine.

18,132. Do you think that the men prefer stemples to ladders ?—They are more convenient for our mine than ladders would be ; we have not many deep shafts to climb up, they are more inclined.

18,133. Do you draw up any of the shafts ?—No.

18,134. Have you worked as a miner yourself ?—I worked for twelve months when I commenced with my father.

18,135. How many years have you been manager ?—45 or 46 years manager and assistant, I took the whole upon myself after my father's death in 1836.

18,136. Is the Sunside Mine a wet or a dry mine ?—It is generally dry.

18,137. In driving a forehead do you ever find a want of air on any occasion ?—Very rarely.

18,138. How do you ascertain that ?—We can tell by the burning of the candle.

18,139. Do the men report if they find it ?—We have no bad air, only sometimes it may be rather dull for want of circulation : there is no fire damp or anything of that sort. Occasionally we have a want of circulation, sometimes even a change of weather affects it.

18,140. Do the men on that occasion leave the work ?—No ; it is a very rare occurrence for the men to leave the work.

18,141. They work on as long as they can get the candle to burn ?—If the candle will burn, then of course they will work on ; perhaps it will be rather dull and they may work on as long as they can after that.

18,142. Do they then apply to you for any artificial means ?—We make air ways as quickly as we can, as soon as we see that it is really necessary.

18,143. Do you use any artificial means such as fans ?—We have fans and zinc pipes mostly for blowing.

18,144. Are those blowers supplied with air by a machine worked by hand or by water ?—Mostly by hand work.

18,145. You have no water blast ?—Not at present ; we occasionally use them in some parts of the mine, when we require them.

18,146. At present how long should you say that in any one forehead the smoke is getting away after blasting ?—It will be away in five or ten minutes. Of course, it depends upon the air, how near they are to an air way.

18,147. (*Mr. Holland.*) That is about the usual time, is it ?—It will vary a little ; it will be from five to ten minutes, some will be longer and some shorter.

18,148. (*Chairman.*) Will it ever be as much as an hour getting away ?—No ; not in getting away from the forehead.

18,149. How many men generally work in a partnership ?—Generally four.

18,150. Do you set the contracts yourself ?—Yes.

18,151. How many hours do the men work?—We require them to work six; they will perhaps work from five to six.

18,152. Are there so many men working by the bing and somany by the fathom?—Yes.

18,153. When they work by the bing are they bound to work so many hours?—We like them to stick pretty closely to the work for so many hours.

18,154. Do they work night shifts on those occasions?—It is very rare; we only work night shifts when we are lifting water from under levels.

18,155. Is that pumped by hand below?—No; we have a steam engine; it is only on one particular part of the mine in which we have it; we do not expect it to be of any long continuance.

18,156. Do the men pay for their powder and candles?—Yes.

18,157. What do they pay for their candles?—We generally charge them according to the price we give, sometimes it is lower and sometimes higher.

18,158. What is about the present price?—6*s.* 6*d.* a dozen.

18,159. Where do you get them from?—In the neighbourhood.

18,160. Do you contract for them?—Yes; we buy them every month.

18,161. (*Mr. Kendall.*) Do the men pay 6*s.* 6*d.*?—Yes.

18,162. What do you give?—6*s.*; we generally charge about a halfpenny a lb. more, just to keep them below the retail price; if we charged them only 6*s.* they might make a trade of it.

18,163. (*Chairman.*) Are they limited to a certain amount?—No; they have any quantity which they require.

18,164. What do you charge them for the powder?—We generally charge from 16*s.* to 18*s.* a quarter barrel, cost price from 50*s.* to 56*s.* per barrel 100 lbs., of course, the price of powder goes up and down; powder has been rather lower of late, but we have not reduced the price.

18,165. Do you use the large or the small powder?—The small powder.

18,166. Do you think that that is better than the large grained powder?—Yes; we like it better, we think that it does not make so much smoke for one thing.

18,167. (*Mr. Holland.*) Is the mine very dry?—Yes.

18,168. (*Chairman.*) Have you ever any accidents from blasting?—I scarcely remember but one; a man got his eye injured with it; he went back too soon before he had given the hole plenty of time to explode.

18,169. (*Mr. Holland.*) Were you well acquainted with the miners 20 years ago?—Yes.

18,170. Is their condition as regards health much different from what it was 20 years ago?—No; I see very little difference.

18,171. (*Mr. Leveson Gower.*) At what age do the boys begin working on the surface?—On the surface they begin at 12 or 14 years of age.

18,172. I suppose they leave off going to school then?—Yes, we do not keep more than about half a dozen boys altogether.

18,173. Have you schools?—There is a school adjoining the mine to which we subscribe.

18,174. Does the parent pay anything towards the school?—Some do.

18,175. (*Sir Philip Egerton.*) Have you much miners' asthma amongst the men?—No; I do not know that we have any more than there is generally in the neighbourhood among the other people who are not miners.

18,176. There is not more disease amongst your miners than amongst the agricultural population?—No, I think not.

18,177. Is there any medical club to which they belong, or do they just call in the union doctor, or any medical man?—They are generally in clubs, the Odd Fellows, and so on.

18,178. Benefit societies?—Yes; they mostly join those societies, and they have a doctor belonging to those clubs.

18,179. (*Mr. Kendall.*) What is the length of the most distant forehead which you have from good air; you have two levels a mile and a half long, take the end which is the furthest from good air?—I think not more than 100 yards; we have only one which is that distance. We have some a good deal nearer.

18,180. Have you a fan there for it?—No, we do not require it, we have a double way-gate; this is a top level. We have another rise from a horse level which makes a communication of air.

18,181. But still your end is 100 yards from that communication?—Yes.

18,182. Do you find the air bad at all there?—It is duller; it is worse when the men give up working. There are two men at a time, and they stop about five hours.

18,183. Have you any intention of ventilating it better?—Yes; we shall open a shaft from the surface.

18,184. How many fathoms is that?—About 40 fathoms from the surface.

18,185. Why have you not done that before; is it because of the expense?—No, we have not required it; but now we see that we shall have to do it.

18,186. Have you commenced as yet?—No.

18,187. How many fans are there at work in the mine?—Not more than three or four and those only occasionally.

18,188. Then if you do not use a fan here, where you do use a fan the air must be still more dull?—No; we place it where the air is very good, and take zinc pipes from thence; it is of no use blowing bad air back again.

18,189. But you do not blow any air into this forehead which is furthest off as yet?—No, we do not require it; the men can work without it.

18,190. What is the age of the boys who work these fans underground?—Sometimes they will have a boy of 12 or 14 years old.

18,191. Then you do allow them to go underground at that age?—Yes; two or three, we have not more than that; perhaps they will be 14 years of age. I think that we have only one at present.

18,192. No boy works as a miner underground; but those boys go to blow the machine?—No; the men blow themselves, or they hire a boy.

18,193. Is any person employed to mark the time when the men go down and when they come up?—No.

18,194. Then you allow them to follow their own mind on that point, in a great measure?—I let the contracts, and if I am not satisfied with the working I discharge them as I think proper; we have not anybody to watch them on our part.

18,195. How deep is your steam engine under the adit level?—20 fathoms.

18,196. What depth have you extended east and west from that?—About 40 fathoms east. We have another drift way at 10 fathoms deep, where it is about the same distance east, and about 50 fathoms west.

18,197. How do you ventilate at the 40 fathoms?—From the horse level; we have several sumpts and shafts or pits, down to the 20 fathom level.

18,198. How far is the furthest end from any good air there?—We have plenty of good air.

18,199. But how far is your end off?—40 fathoms.

18,200. You have no communication to come back to the shaft?—No, excepting with the horse level.

18,201. How far is the communication into the horse level from the very end of the 40 fathom level?—It will be within 12 fathoms.

18,202. (*Mr. Holland.*) You have said that the men work six hours each set, in two sets?—We require them to work six hours.

18,203. At what hour do they go on?—At six in morning, and come out at 12; it takes them nearly an hour going and coming.

GRASSINGTON.

Mr. M. Newbould.

5 March 1863.

18,204. At what time does the second set go in ?—They follow the first.

18,205. Immediately ?—Yes; they meet on the way.

18,206. And they work till 6 ?—Yes.

18,207. Then from 6 till 6 the mine is occupied ?—Yes.

18,208. And again from 6 to 6 it is unoccupied ?—Yes, in some parts, not in all parts of the mine. We have eight or nine miles of horse level.

18,209. Is the air much fresher at 6 in the morning than it is at 6 at night ?—In the whole mine we have not above three workings which are rather dull.

18,210. The difference is not very great ?—We have plenty of ventilation in our mines.

18,211. (*Mr. Kendall.*) Do you smelt your own ore ?—Yes.

18,212. What sort of health have the smelters ?—One of them died not 12 months since, and he was about 64; and he was a smelter from nine years of age.

18,213. His health was very good ?—Yes; his father was a smelter, and he lived till he was between 70 and 80.

18,214. (*Mr. Leveson Gower.*) Is the smelting done in the open air ?—No, it is covered up.

18,215. Are the dressers covered over ?—No.

18,216. (*Chairman.*) You said that the pumping engine pit was 20 fathoms below the horse level ?—Yes.

18,217. Is it at the mouth of a level ?—No; it is up in the middle part of the mine; we go up the horse level to it.

18,218. Have you ever observed whether there is any particular draft coming to that fire of the engine ?—There is of course a very good draught to the engine.

18,219. Do you think that it is of any use in ventilating the mine ?—We should not require it at all for working the mine if it was stopped up.

18,220. Is there an excess of draught along that level where the fire is ?—There is rather more just about where the fire is, but it does not make so much difference in the other levels; if you go even 40 or 50 yards from it, it does not make much difference.

18,221. You do not think that it acts as aiding the draught in the level ?—We have plenty of air without it; quite sufficient for any purposes.

18,222. (*Mr. Kendall.*) Where is your engine placed ?—Even with the adit level.

18,223. At the surface or in the mine ?—In the mine; it is even with the horse level.

18,224. How far in ?—About three quarters of a mile; and from the surface down to where this engine is placed it is about 60 fathoms deep.

18,225. (*Chairman.*) Has there been any occasion when the men have had to leave their work from any bad air occurring in the mine ?—What we call for want of air ?

18,226. Yes.—By chance; but it is very rare that we have anything of that kind.

18,227. In which description of bed is it more difficult to ventilate ?—In the shales and grit beds; I think they require a better ventilation than even the limestone does.

18,228. (*Mr. Leveson Gower.*) Do you extract fume from the chimney ?—We have a short horizontal chimney, but it is only a short one, it is not more than 30 or 40 yards; we clean it out once a year, or something of that sort. We have one miner now working 75 years of age who has been a miner all his life, and we have several from 60 to 70.

18,229. (*Chairman.*) How often are the men paid ?—We pay them every month.

18,230. And you clear off every month ?—Yes.

18,231. (*Mr. Holland.*) Are they paid for the current month ?—For instance, we clear off about the end every month, and we pay them on the third Wednesday in every month.

18,232. For the previous month ?—Yes; for February we shall pay on the third Wednesday in March; we only keep about a week in hand.

The witness withdrew.

Mr. WILLIAM BARRON examined.

Mr. W. Barron.

18,233. (*Chairman.*) Of what mine have you charge ?—Craven Moor.

18,234. Any other ?—No.

18,235. What number of men have you working underground ?—40.

18,236. How do the men go to the work ?—They go down ladders chiefly.

18,237. They go down a shaft ?—Yes, 56 fathoms.

18,238. How many shafts have you ?—One.

18,239. Is it bratticed in the middle ?—Yes; we have one shaft divided into three; we have two drawing shafts and one climbing road for the men as well.

18,240. How many levels are you driving from the shaft ?—We are driving two at present.

18,241. How far is the forehead from the mouth of the shaft ?—About 150 fathoms west at 42 fathoms deep.

18,242. How do you get air at thatend ?—The Old Man has worked it for several years before; it is a very ancient mine, and we hole up into his workings; there are other shafts from different workings, so that we can come out very near any place, viz., Woodhouse shaft, Longthem shaft, Derby shaft, and Cockhill level.

18,243. From these levels you hole up into the Old Man's workings ?—Yes; what we call rises.

18,244. What distance do you carry a level before you think it necessary to put in a rise to the Old Man's workings ?—It depends upon the metal; if we have good batches of metal we cut it all out and get the ventilation behind us.

18,245. When you drive by the fathom, how far would you drive ?—By using good zinc pipes we can drive 100 or 200 fathoms and sometimes 300, with fans or pressure of water confined to pipes.

18,246. Do zinc pipes decay ?—No, I have not found any decay.

18,247. How are the fans driven ?—By water wheel generally. None at Craven Moor.

18,248. What do you use ?—A trap door.

18,249. What size are the zinc pipes ?—From four to six inches.

18,250. And that gives you sufficient air without having a fan ?—Yes, for the distance that we drive.

18,251. Where you put the trap door, is the air which is diverted by the trap door from the bratticed shaft or from an Old Man's working ?—From a level; we have a level which comes in from the Cockhill mines to take all the water out, a depth of 56 fathoms; and we have a thorough communication of air both into the bratticed shaft and the other way. We put a trap door in the main level, and in a change of wind we have it both ways.

18,252. Then I suppose that the up-cast is dependant upon the weather ?—Yes; sometimes it draws down the level and sometimes it comes up the level and shaft, and it acts in the same way in the pipes; it is sometimes like a pump forcing the air in, and sometimes it is drawing it out; but the furthest level at present is only 48 fathoms from the trap door of main level.

18,253. And you find the air perfectly good ?—Perfectly.

18,254. How do you ascertain that ?—By the candle.

18,255. Not in any other way ?—No; we never think of anything of the kind; if the candle will burn straight up without slanting it, we consider that quite good and safe.

18,256. Supposing you were obliged to incline the candle, what should you do ?—We should leave off for a day.

18,257. Have you ever had to do that ?—No, never at Craven Moor.

18,258. Have you worked as a miner yourself?—Yes.

18,259. In what mines?—In the county of Durham mines; and I have worked at Rookhope, at Brandon Walls mines, the Derwent mines, Healyfield, and Silvertonnge mines, and I have been at Greenside mines in Westmoreland; I was agent there for four and a half years.

18,260. How long have the Craven Moor mines been working?—I believe about eight years by the present cess. I have been here about five years.

18,261. Is a deduction made from the men for candles and powder?—We let the contracts and keep a store and find all these things, and we take it off their money, but we calculate powder and candles. Not in average of wages.

18,262. What have the men to pay for candles?—7*d.* a lb., and 7*d.* a lb. for powder.

18,263. Are there any other deductions?—We find work tools as well, and we deduct 6*d.* a pound for the wear and tear.

18,264. (*Mr Holland.*) Is there any peculiar disease among the miners?—Not in our parts at all.

18,265. Are they as healthy as other labourers?—I think that they are; we have one man 75 years of age.

18,266. But take them as a body, is there any asthma among them?—There is some, but very little.

18,267. Is there more than among agricultural labourers?—Yes, in any mine there is a little more than that; but I think that in the limestone district there is very little difference between them and the agricultural labourers, as they only work six hours per day, and all get home to their own houses.

18,268. Do they look as young as other men of their age?—Yes.

18,269. (*Sir Philip Egerton.*) I think you say that the men go to their work by ladders?—Yes.

18,270. Is it usual in this district to have ladders?—A good many of the miners in this district go in by ladders.

18,271. Which do the men prefer, ladders or stemples?—Ladders; but I do not prefer having the ladders so long, because when you put in a ladder 20 or 30 feet long you make a stage, so that when a man gets up it, it is a little bit of relief.

18,272. (*Mr. Holland.*) You make a little slope?—Yes.

18,273. (*Sir Philip Egerton.*) As to the difference of expense between ladders and stemples, which do you suppose are the most costly to put up?—I should think that ladders in a permanent shaft would be considerably cheaper.

18,274. Do you think that they are safer than stemples?—Yes, a long way; I am confident of it.

18,275. (*Mr. Kendall.*) Have you ever been in a mine where stemples had been used, and where they had been done away with and ladders introduced?—In all the permanent roads (and I have been a miner since I was seven years of age) there have been ladders; but in little temporary roads which are wanted only for a few months you merely put in a few stemples, because it is not worth while to put in ladders.

18,276. (*Sir Philip Egerton.*) You mean in the rises where you want them for access?—Yes.

18,277. (*Mr. Leveson Gower.*) Do you ever use stemples in those cases?—Yes; sometimes we put in a ladder if it is likely to be a permanent road.

18,278. (*Mr. Kendall.*) Did you ever know a case where a miner quarreled with the ladders, but where after the use of ladders he preferred them to stemples?—No, I never heard of men making any objection to a ladder.

18,279. (*Mr. Holland.*) If ladders were put too long the men perhaps would object?—I think it is dangerous.

18,280. And is it not laborious?—Yes.

18,281. It is very hard work?—Yes.

18,282. (*Mr. Kendall.*) How frequently are there rests in your ladders generally?—From 21 to 30 feet.

18,283. What is the size of the hole through which the men go down?—Two feet.

18,284. The whole of the rest is covered over?—Yes.

18,285. (*Mr. Holland.*) How long is the floor?—It depends upon the size of the shaft; our shaft is six feet, and we slant the ladder.

18,286. You have a slant of about 5 feet in every 30?—Above three feet.

18,287. That is very steep?—No; the first ten fathoms that we go down we go right down one ladder almost.

18,288. (*Sir Philip Egerton.*) In case of a man missing his hold, are your stages strong enough to prevent his falling?—Yes, quite.

18,289. (*Chairman.*) Have you any accidents from blasting in your mine?—Not here; not much in the limestone. It is a very safe thing for that.

18,290. Is it the same in other strata?—No, not in the grit stone or the blue slate rock, or anything of that sort; it is more dangerous there. I should recommend copper prickers to be compelled to be used at those places.

18,291. Would it not be equally dangerous with the jumper or the tamping rod?—No, not with the tamping rod. With a copper pricker and an iron tamping rod very few accidents occur.

18,292. (*Mr. Holland.*) What is your tamping material?—Merely shale or a little barita.

18,292*a.* Is there that in the mine?—Yes; but we generally use shale.

18,293. (*Chairman.*) Do you use fuses at all?—No, we use at straws; we only use a fuse where it is very wet; it makes too much smoke when it can be done without.

18,294. (*Sir Philip Egerton.*) Do you use small powder or large powder?—Both kinds. The small powder is generally used where it is dry work, and the other when it is very wet.

18,295. (*Chairman.*) What do you think the most injurious thing to the miners' breathing besides the bad air?—I do not think that powder smoke is a very injurious thing, but still if you have too much of it you spit a deal of black when you come out. I would recommend a squib wherever it can be used for the sake of making less smoke.

18,296. (*Mr. Holland.*) What description of match do you use?—A slow match made of paper with grease from the candle.

The witness withdrew.

Mr. BENJAMIN CALVERT examined.

18,297. (*Chairman.*) Of what mine have you charge?—The Nedderdale Mining Company.

18,298. How many workings does that comprise?—Only three at present.

18,299. Which is the most extensive of those three?—The adit level.

18,300. What length is that adit level?—Perhaps from 700 to 800 fathoms.

18,301. What number of men are working?—Six.

18,302. How many are working underground altogether?—Six in the adit, and two fours in the other workings.

18,303. Do you communicate with any of the Old Man's workings?—No, it is a new thing; it is maiden ground. We shall have to do so by and by, but it will be sometime first.

18,304. What communication have you with the surface besides the adit level?—We have two communications; we have one very recently put through

GRASSINGTON. *Mr. B. Calvert.* 5 March 1863.

near to the head of the adit level; we have another about 100 or 150 fathoms further back.

18,305. In driving, before you put up this last rise to the surface, was the air at all close?—Very much so at times.

18,306. How long were you getting the rise up?—From 5 to 6 months.

18,307. During that time what means of ventilation did you provide?—We had a very powerful water blast, but that water blast was not sufficient to keep the bad air clear continuously; and we had a double communication as well. We had two sets of tubes up into a rise to help us to get this rise put through to another top level; but at times, for four or five days, the air was so bad that no one living could get in.

18,308. Then the men were obliged to leave off work?—Yes, of course. A candle would not burn, and a man could not live.

18,309. Do you think that that was affected by the weather?—Yes; altogether by the weather.

18,310. How often did that happen?—I think that happened, we will say, three times in the five months.

18,311. Has the new shaft completely remedied that evil?—Yes; we have had to put up doors to quench the air; we could not keep a candle in. We could not get up and down after we got the communication complete; and so we have had small doors put in to prevent that.

18,312. Had you to pay the men higher?—Yes, occasionally; because they must have something to live on, and so we had to give them an extravagant price to get this rise put through. Since that we have reduced the prices.

18,313. The men are always willing to work if you paid them for it?—Yes; they were willing to work when they could; but when they could not it was impossible.

18,314. Do you think that the men suffered at all from working there?—There was no compulsion used. If they had been forced to go in, and to remain in as long as they really could, they would have suffered; but I do not think that they suffered materially at all. If they had continued for a length of time there is no doubt of their suffering. I know that they would have suffered.

18,315. Were they off work from suffering during that time, or were they always able to come as soon as the place would admit of it?—They were always able to come as soon as the place would admit of it; there was nothing to prevent them.

18,316. Do you think that there was any carbonic acid gas generated in the mine, or that it was from want of air?—It was from want of it; but the damp was so strong, that if you had stopped too long you would have fallen down the same as a crow being shot out of a tree.

18,317. Was it worse at the top of the level or the lower part of the level?—It was generally the worst up above; it was owing to some different beds that we had to go through.

18,318. What were the beds through which you were driving before you got the last rise?—In this place it is all shale and grit.

18,319. Do you think that that is worse for ventilation?—Yes, no doubt of it.

18,320. Why do you think that it is worse for ventilation?—It contains more sulphur.

18,321. Have you worked as a miner yourself?—I have been in the mines now for something like 48 years.

18,322. How long as a miner?—I worked for, it may be, 27 years. Since that I have been engaged as agent.

18,323. How do the men go into the mine; by the adit level?—They can take either way now. There is very good accommodation either way.

18,324. Have you ladders or stemples?—We have only stemples at present.

18,325. Have you worked in mines where there were ladders?—Yes.

18,326. Which do you prefer?—I prefer ladders.

18,327. Do you think that the men generally prefer stemples or ladders?—A good many of the men prefer stemples; I do not. As an agent I prefer ladders.

18,328. Did you begin to work with ladders or with stemples?—Stemples.

18,329. And when you had to work with ladders did you object?—I did not much like them at first.

18,330. And after a time, having tried the ladders, you preferred them to the stemples?—I prefer them decidedly.

18,331. (*Mr. Holland.*) How long was it before you got to like the ladders?—In a few weeks. They are safer.

18,332. (*Mr. Leveson Gower.*) Why do you not put up ladders yourself now?—I believe that we shall; but two parts out of three is what we call a slant rise, and there is only about 12 fathoms plum; and I think that we shall put in ladders after we have got it complete; but we have some water to take off at present. To make the thing more complete, I should recommend ladders into any place.

18,333. (*Chairman.*) Is yours a wet or a dry mine?—Some odd places are rather wet, but it is not generally wet like some places that I have been accustomed to.

18,334. Do the men get wet in working there?—No, not much.

18,335. Is there much dust in any part?—No; there is not much dust either.

18,336. Have you ever any accidents from blasting?—No; we have not had one that I can remember.

18,337. Have you ever known of an accident from blasting when you have been working in a mine?—I have only known one in our district, and that was 40 years ago.

18,338. (*Mr. Holland.*) Do you fire your blasts by means of greased paper?—They do it chiefly by straw.

18,339. Is the straw lighted by a piece of greased paper?—Yes; a greased match.

18,340. Does that burn pretty regularly?—It depends upon the making of it. If it is twisted too tight it cannot burn, when it burns very slowly.

18,341. Does it ever burn unexpectedly fast?—No, I do not know that it does; not too quick.

18,342. But sometimes too slow?—It is sometimes too slow.

18,343. Does it ever miss fire?—The straw sometimes does.

18,344. But the match does not, does it?—Sometimes it does go out.

18,345. When the straw misses fire do you hole it out again?—We generally try to get it out and put in a second one.

18,346. Can you get it out safely?—Yes, with a straw you might.

18,347. Does it ever fire when you are getting it out?—No; but if you cannot get your straw down sufficiently, and have to bore it out, there is a risk.

18,348. Do you believe that the powder in that case can be got out dry?—Very often when it does not go it is on account of the damp, and on account of getting wet, and there is no danger if it is wet in boring it out again.

18,349. You trust to that, do you?—Yes; that is trusted to, and perhaps rather too much.

18,350. Do you consider miners much more unhealthy than other workmen in this district?—I do not know; a good deal depends upon men working continually in certain sorts of works, in a close heading where they are working continuously for years and years, it does injure them a little.

18,351. Do they look considerably older than other men of the same age?—I do not see that they do.

18,352. (*Mr. Leveson Gower.*) Have you ever known of any accident from the use of stemples?—Yes, I have.

18,353. How many?—One.

18,354. Was it fatal?—No, it was not fatal.

The witness withdrew.

Mr. Joseph Broad Champion examined.

18,355. (*Chairman.*) Of what mine have you charge?—Merryfield Mine.

18,356. Have you ever worked as a miner yourself?—Yes.

18,357. For how many years?—About six years.

18,358. How long have you been agent of the Merryfield Mine?—I have been there near about three years now.

18,359. How many men have you employed underground?—18.

18,360. What is the strata in which you find the ore principally?—It is principally between shale and grit.

18,361. Is it mostly picking or blasting?—Generally blasting, I think.

18,362. How many levels have you?—Two.

18,363. Which is the longest?—The adit level is the longest.

18,364. What is the length of it?—About 900 fathoms.

18,365. Do you communicate with the Old Man's workings?—We have not opened up the Old Man's workings.

18,366. How many rises have you in the course of that level?—We have three shafts from the surface.

18,367. How far is the forehead from the last shaft?—Merryfield level is communicated with Storney Groves level, and they carry the level forward.

18,368. How far is where you are working now at the forehead from the shaft?—About 20 fathoms.

18,369. Have you any difficulty in ventilation at that point?—No, not in the least.

18,370. Do the candles burn quite well?—Yes.

18,371. How far shall you drive before you put up another rise?—About 10 fathoms further; 30 fathoms we propose.

18,372. You think that you may drive 30 fathoms safely?—We could; but I think that in grit 30 fathoms is quite sufficient for the men to have good air.

18,373. There is more difficulty in getting good air in grit and shale than in limestone?—Yes; I think that there is.

18,374. Since you have been working there, have you ever had occasion to employ any artificial means for throwing in air?—Yes; we opened out the level 600 fathoms with air pipes alone.

18,375. Had you any means of throwing air into the air pipes?—Yes; we had a 40-fathom water blast.

18,376. Did you find it quite sufficient?—Yes.

18,377. What size was the pipe?—Eight inches.

18,378. Was it zinc or wood?—Zinc.

18,379. Does the zinc decay or corrode at all?—Yes; the water did decay it. I suppose that it was sulphuric acid coming from the sulphur which decayed the pipe.

18,380. How long do you think that they would last?—They last a great number of years with care.

18,381. But if they decay at points, the air escapes without coming on to the end, does not it?—Yes; and then we lap it with flannel.

18,382. You have to try it constantly?—Yes; we tried it in fact every day.

19,383. Do the men have extra pipes to carry on to where they are working?—Yes; they keep it on as close as possible.

18,384. How far is the mouth of the pipe generally from where they are blasting?—Generally about two or three fathoms; the pipes are nine feet long.

18,385. Have you ever any accidents from blasting?—No.

18,386. Do you make a deduction from the men for candles and powder?—Yes.

18,387. What do the pay for candles?—7*d.* a lb. as a general rule.

18,388. And how much for powder?—9*d.*

18,389. Do the men all go in by the levels?—Some go in by the levels and some go down by a ladder.

18,390. Have you ladders or stemples?—Ladders.

18,391. Do the men prefer the ladders to the stemples?—Yes.

18,392. Have you no stemples in any part?—We have no stemples.

18,393. (*Mr. Holland.*) You have said that the zinc pipes frequently decay; is that at the point where they are supported?—No; it is generally where there is a drop of water coming down from an old working.

18,394. How are the zinc pipes supported, upon holdfasts?—Yes.

18,395. Iron holdfasts?—Yes.

18,396. Is there anything between the iron and the pipe?—Yes; flannel.

18,397. Does that last pretty well?—Yes; it lasts very well.

18,398. It keeps them apart for a long time?—Yes.

18,399. Do you think that flannel is as good as wood for that purpose?—Yes; I think so.

18,400. Do you think that it lasts as long?—Yes; quite as long, I think.

The witness withdrew.

Mr. Henry Daykin examined.

18,401. (*Chairman.*) You are underground agent for the Grassington mines?—Yes.

18,402. How long have you been so?—I have been connected with Grassington and Cononley mines for 50 years.

18,403. Were you originally working in the mines?—Yes; have been agent eleven years.

18,404. How many men have you working underground now in Grassington mines?—About 76, I believe.

18,405. They are scattered about very much?—Yes; very much.

18,406. Do the men mostly work by the bing or by the fathom?—By the fathom; and so much a ton when we are working in pitch ground; it is not a custom in this country to work by bing; not in Grassington mines.

18,407. In what strata is the principal ore?—Grit.

18,408. Do the men suffer at all from the dust in grit in their breathing?—I should say that they will a little.

18,409. Do they work by blasting, or is there any work by pick?—Both ways.

18,410. Are the men working by pick more subject to dust?—No; I should say not.

18,411. In Grassington mines are all the workings in connection with the Old Man's workings?—Yes. Not all; some veins have been worked, not being connected with any of the Old Man's workings. I have not been in Grassington mines all that time. I was eleven years in Cononley Mine. I was a year and a half abroad.

18,412. Have you ever had occasion to employ artificial ventilation?—Many times; we are doing that now.

18,413. What means do you use?—In general we use a machine—a fan.

18,414. A hand machine?—Yes.

18,415. Is it a part of the contract that the boy who drives the fan is to be paid by the men?—No; the master always pays him.

18,416. Do you judge when it is necessary or do the men apply to you?—We judge when it is necessary; it depends upon the air; in some places we can work longer without employing artificial air than in others; it depends a good deal upon the sort of ground which it is, whether it is hard or soft.

GRASSINGTON.
Mr. H. Daykin.
5 March 1863.

18,417. Supposing that the men could not get a boy to drive the fan, would they stop their work?—Yes; they could not work without air; we always have boys, and we always get plenty of boys; we have a great many applications to employ boys, more than we can employ.

18,418. At what age do they drive?—Fourteen or fifteen, and so on.

18,419. Does it never happen that the men go on working, and the boy leaves the work?—The boys will sometimes play a bit, and the men have to get them to come back to work many times; they very soon know when the machine stops; boys are boys, and they will play a bit sometimes.

18,420. And leave the machine?—Yes.

18,421. (*Mr. Holland.*) The men find it out in an instant, do not they?—Yes.

18,422. (*Chairman.*) Supposing that the boy left the work, the men would go on working for the rest of that day, probably without him?—They would be very much inconvenienced if they did so.

18,423. But still they would probably do so if the boy had left the work?—Yes; unless it was very bad; if it was very bad they would come away.

18,424. But if not, they would continue at work?—Yes.

18,425. Had you any complaint from the men after I inspected the mine, that the boy had left?—No; I do not know that I had. The boy sometimes stops for a few minutes.

18,426. Do you use much timber in your mine?—In some places we do, and in some places we do not want any.

18,427. Do you judge when it is necessary to timber, or do the men apply for it?—The men know as well as we do.

18,428. And can they always get it?—Always; they have access to it at any time. We have plenty of timber, and the men always have it to go to when they want it; sometimes we will scold them for not taking it; sometimes they work where it ought to be put up, and it is not put up.

18,429. Do you fine the men at all for anything?—We do for bad conduct.

18,430. Supposing that a man was working where timber ought to have been put up, and where it was dangerous to work without it, and he had not applied for it, should you fine him?—No; we have never done so to my knowledge.

18,431. But you would find fault with him?—Yes.

18,432. From the fear of being found fault with is it likely that he would make an excuse that he could not get it?—I should think that he would not, seeing that it was there knowing that he could get it, because we have always plenty ready.

18,433. You always have it ready sawn?—Yes.

18,434. Then if a man stated that he could not get it, that no timber was sawn, you think that that would only be an excuse?—Yes; we have always plenty of timber on hand. I never saw a better place.

18,435. The men do suffer from working under ground I suppose?—I should say that they will.

18,436. What do you think they principally suffer from?—I should think from the grit dust, that that is the worst; that is my opinion of it.

18,437. More than from any want of air?—Yes, I think so.

18,438. Do the men enter the workings by the level, or do they go down by ladders or stemples?—By ladders, in our mines.

18,439. In some parts of the rises is it by stemples?—Underground some of the rises have stemples and some of them have ladders.

18,440. Do you go down sometimes by windlass?—Not much; perhaps we do while we are sinking, but afterwards we generally put ladders down.

18,441. Which do you think best, stemples or ladders?—I should say ladders.

18,442. (*Mr. Holland.*) Is there any doubt of that?—No, there is no doubt of it in my own mind. I have been used to both, but I should prefer ladders myself.

18,443. Why?—Both for speed and for safety too.

18,444. And ease of climbing?—You can make it easy both in climbing ladders and stemples too, it depends upon the speed.

18,445. (*Mr. Leveson Gower.*) Have you ever known any accident from the use of stemples?—I have known a leg or two broken.

18,446. You have known no fatal accident?—No, never in my life.

18,447. (*Mr. Holland.*) Have you known any accident from ladders?—Only slight ones, nothing of any importance.

18,448. No broken bones?—A broken leg, or something of that kind. I know a boy, who not long since, had his leg broken through falling from a ladder.

14,449. (*Chairman.*) At the end of each ladder is it covered over?—We have what we call a ladder soller, and a manhole through.

14,450. (*Mr. Holland.*) At what distance are your sollers generally from each other?—Perhaps four fathoms.

14,451. How long are the sollers generally?—It depends upon the width of the place.

18,452. What is it generally?—Perhaps 6 feet long by 3 feet 6 in width, something of that sort; but in the main shafts they are larger.

18,453. What is the usual length?—6 feet by 3 feet 6.

18,454. You said that you used fans for driving air in?—Yes.

18,455. Is there any doubt about the economy of using those fans?—We consider them the best of anything here, unless we can bring water to bear.

18,456. Is there any doubt that it is cheaper to drive air in than to let the men be short of air?—It must be cheaper, they could not work in bad air.

18,457. Do you use those fans before the air gets so bad as to affect the candle?—No; it depends a good deal upon the place where we are working; if it is hard ground we require a fan sooner, we cannot go far, but in ground which can be worked with a pick we should go further.

18,458. Is the fact of the candle beginning to grow dim your mark of the want of air?—Yes, generally, and the breathing.

13,459. Do you use a fan before you find it out by the candle?—No, I cannot say that we do.

18,460. Would it not be profitable to do so?—I cannot say; many men would want it when perhaps there was no occasion for it.

18,461. Cannot men do a better day's work when the air is good than when it is poor?—Yes.

18,462. What is the pay for working a fan?—We have two boys now working a machine, one of whom has 1*s.* 1*d.* and the other 1*s.*

18,463. Does one boy work as long as the men work?—Yes.

18,464. That is 1*s.* for the pair?—Yes; 1*s.* each boy per shift or day of eight hours.

18,465. Are the men of that shift able to earn more than 1*s.* because of the air?—Yes; I should say so.

18,466. There is no doubt if it is there?—Not a bit of doubt of it.

18,467. Then would it not be well to give these men who wish for more air, the air which they wish for, though it is not strictly wanted?—If they have sufficient air to work with we think that all that is necessary.

18,468. But if they could work better with more air, would it not be more profitable to let them have it?—But I do not know that they could.

18,469. You think that sometimes the men would ask for it when it was of no use at all?—Yes, many a time.

18,470. (*Sir Philip Egerton.*) What is the condition

of your working miners; are they a sober race?—They are very sober men here; there are exceptions.

18,471. Have they comfortable homes?—Very comfortable, I should say, for the most part.

18,472. What sort of distance have they to come to work?—I should say that it would be three miles from this village up to some of our places.

11,473. Do they walk three miles there and back?—Yes.

18,474. Do they take their dinners with them?—Yes.

18,475. Have you any places appointed for them to change their clothes?—We had a place on purpose, since I have been agent here, and they would not use it.

18,476. Then they walk home in the clothes in which they have been working?—Yes, they do.

18,477. It is not a very wet mine, is it?—No; it is a very dry mine.

18,478. There is not much drip from above?—No, not much. In sinking shafts or anything of that sort, there is dropping, but it is a very dry mine over head.

18,479. Do the men generally live pretty well?—Both ways I should say.

18,480. Do the single men take lodgings with the married cottagers, or have they cottages of their own?—Some do, who have not parents to live with; some live with their parents at home until they get married, and those who have no parents lodge with other people.

18,481. Have any of the miners gardens or land attached to their cottages?—Some few, but not many here.

18,482. (*Mr. Kendall.*) What is generally the size of the vein in your mine?—It varies very much.

18,483. From what to what?—We have one vein, I should say, six or seven fathoms wide; indeed, I have seen it so myself, and we have some no broader than two inches.

18,484. Where it is so very wide, is it rich?—Yes, in some places.

18,485. Where is the richest part now?—We have no rich place working at present; it is very poor now.

18,486. But you have had rich deposits?—Yes.

18,487. Where have you found those rich deposits principally?—In veins two or three feet wide, and some as far as six, and some as far as 14 have been very good.

18,488. How many tons of ore have you ever raised in one fathom?—I should say that we had one place, since I have come here, where we got 9 tons in one fathom.

18,489. What was it worth a ton, 20*l.*?—Not in ore.

18,490. Would the ore produce lead of 20*l.* a ton?—Yes, lead.

18,491. What is the produce of that ore?—75 per cent.; we sold some of it for pottery ore.

18,492. Do you find any difference in the air according to whether there is plenty of ore or not?—No, I cannot say that we do.

18,493. There is no difference whether you are working in a quantity of grit or lime, or where there is a quantity of lead?—It is better ore in lime.

18,494. But you see no practical difference as far as the air goes?—No.

18,495. (*Mr. Holland.*) Are any of your levels particularly hot?—No.

18,496. They never get above summer heat?—No; nor up to summer heat.

The witness withdrew.

Mr. WILLIAM CRAIG examined.

18,497. (*Chairman.*) Will you name the mines of which you have charge?—I have the superintendence of two or three mines in Wensleydale, and one or two in the neighbourhood of Kettlewell. I superintend mines in the higher part of Wensleydale belonging to the Wensleydale Mining Company.

18,498. What are the names of the mines?—They are called Hawes and Bainbridge. Then I am connected with another mine at Woodhall, near Askrigg in Wensleydale.

18,499. Those mines at Kettlewell are small workings?—Yes.

18,500. Which are the largest working with which you are connected?—Those in Wensleydale.

18,501. How many men have you working underground?—I can scarcely speak to that; I am only consulting engineer, and I have a brother up there. I should think that there are perhaps 100 men. I have three places which I superintend in Wensleydale, and three in Kettlewell.

18,502. Do you visit those mines occasionally?—Some I visit very frequently, and others only occasionally.

18,503. For the purpose of directing the workings?—Yes, generally.

18,504. (*Mr. Kendall.*) You do not set the work at all?—In some cases I set the work, and in others I only direct the work.

18,505. (*Chairman.*) Have you been for some time connected with mines?—I have been brought up to mines; I have been connected with mines for 45 years.

18,506. Is there more difficulty in working in one strata than in another?—Yes, occasionally.

18,507. In what respect?—We find that in the mountain limestone in this district we can drive and do with half the quantity of fresh air that we can in grit or shale; in grit or shale it requires more fresh air.

18,508. Is there any direct carbonic acid coming out of the rocks in any of those cases?—Yes; uphill we have a great deal of it, that is at Wearnside.

18,509. A good deal of carbonic acid comes out of the fissures of the rock?—Yes; particularly after we get under the millstone grit.

18,510. Does it come out so that it puts out the candle at once?—Sometimes I have seen it so that it has driven workmen out, and at other times we have sufficient air.

18,511. Is it affected by the weather?—Yes, I should say so, by the little changes which take place.

18,512. And this finds its way through fissures?—Yes, in some cases; not as a general rule.

18,513. Are the men obliged then to leave the work altogether?—In some cases I have known that they have had to do so.

18,514. What means do you use for remedying it?—If we have a deficiency of proper holes, or proper shafts, or second levels, and so on, we force the air by what we term a water blast, a pressure of water which throws it into a tank.

18,515. You think that that is the best mode?—It it is the best mode which I have tried; I do not know of any other.

18,516. When you have shafts do you observe that any shaft is more particularly an up-cast than another?—Not particularly; but when we have these changes of atmosphere our current of air changes; sometimes the shaft sucks down, as we term it, and at other times it draws up.

18,517. Would it not be an advantage to have one shaft as a permanent up-cast?—I think that it would not answer in lead mines.

18,518. Why not?—I think that we should have a pressure to contend with if we forced it one way in these changes of which we have been speaking, that if the air in the shaft was in the course of going down and you were forcing up, there would be a pressure against it—that is according to my experience. I am not aware of any benefit to be derived from it.

GRASSINGTON.

Mr. W. Craig.

5 March 1863.

18,519. In short, you could not well accomplish it?—It would make no difference whether it goes up the level or down the shaft, because we get the fresh air.

18,520. Is their no stagnation of air at times?—Not in any particular current; but we find the draughts sometimes very much stronger than at others.

18,521. When there is a change, owing to the change in the temperature of the atmosphere, are the men aware of it?—No, I do not know that they are; those are matters which they never notice particularly, except they are working at a great distance from a current of air, and then it affects them.

18,522. They would then discover that there was a change in the atmosphere?—Yes.

18,523. How would they discover it?—The air is not so clear.

18,524. Would they discover it by their own feelings or by the candles?—By the candles generally, that is generally their guide.

18,525. When it is in course of changing, the air is for a certain time stagnant, and will affect the men?—It perhaps does not work so quickly.

18,526 (*Mr. Leveson Gower.*) Dou you use stemples or ladders?—Generally ladders.

18,527. A witness from Swaledale told us that stemples were more economical to put up than ladders, because the stemples were used for supporting the side of the shaft; do you know any mines in which you think that that would be the case?—Yes; I have been in several mines where they climb by these stemples, and by the same timber which supports the shaft; but I decidedly think that it is better to have ladders.

The witness withdrew.

Mr. THOMAS WISEMAN examined.

M. T. Wiseman.

18,528. (*Chairman.*) You are the manager of the Appletree-wick Mine?—Yes.

18,529. Are you manager of any other mine?—No.

18,530. Have you ever worked in a mine yourself as a miner?—Yes.

18,531. For many years?—Yes.

18,532. In what district?—In Kettlewell.

18,533. The mines in the Kettlewell district are all small mines, are they not?—Very small mines.

18,534. Are a good many of them trial mines?—A good many of them.

18,535. Did you ever find the air bad in working these trial mines?—Yes; sometimes the air has been bad at Kettlewell, where we were trying.

18,536. How far have you ever driven a level from the surface where the air has become bad?—400 yards.

18,537. How did you find the air then to affect you?—We found it by the candles; the candles would not burn when the air was bad.

18,538. Did you see any of the men who were working with you suffer from that at all?—No, we did not.

18,539. Did you give up working there?—We would leave it for a few days, or for a week, till the air got good again, and then we would go back again.

18,540. Had you to leave it as much as a week?—I only remember once when we were a week; it was at hay time, and we were at hay, and we did not go for a week.

18,541. Had you ever to leave the work for a day and then go back again, or only for a short time?—Yes, we have had to leave for a day.

18,542. Was that quite sufficient to enable you to work?—Yes, quite sufficient.

18,543. The Appletree-wick Mine is quite a new mine, is it not?—It is.

18,544. Are you sinking?—No, we are driving a level.

18,545. What distance have you driven?—We have driven it 360 yards.

18,546. Is the air quite good there?—Quite good; we have three air shafts in that distance.

18,547. (*Mr. Holland.*) How far could you drive beyond an air shaft?—We have an air shaft close to the forehead.

18,548. (*Chairman.*) What is the distance between each of your air shafts?—80 yards.

18,549. (*Mr. Holland.*) You drove 80 yards beyond the air shaft?—Yes.

18,550. (*Chairman.*) Before you put up the last air shaft, when you were coming to the part where you put it in, was the air at all close?—No, not at all. The ore goes up to the surface and we take it out, and we keep taking it out.

18,551. (*Mr. Holland.*) It was not only an air shaft but also an exploring shaft?—Yes.

18,552. (*Chairman.*) Have you ever had to use any artificial means of ventilation?—Never.

18,553. Have you got on a good vein now?—Yes, it is a very good vein.

The witness withdrew.

Mr. THOMAS JOB examined.

Mr. T. Job.

18,554. (*Chairman.*) Of what mines have you charge in this district?—Only the Hebden Moor at present.

18,555. Have you worked as a miner yourself?—Yes, in Devonshire.

18,556. In what mine?—In Wheal Betsy, and also Wheal Friendship.

18,557. Have you worked in other mines?—Yes; I worked in Coniston mines in Lancashire, about six months 33 or 34 years ago.

18,558. Have you visited other mines?—Yes; both in Ireland and also in Derbyshire since I left there. I inspected them occasionally.

18,559. Have you been in mines where the stemples were used?—Yes, in Derbyshire.

18,560. To what depth of shafts?—I have seen stemples there 24 or 25 fathoms in depth.

18,561. Which do you think are preferable, stemples or ladders?—Ladders.

18,562. You have no doubt of it?—Not at all; they are more easy for climbing, and there is greater safety as well

18,563. What number of men have you working underground in Hebden Moor?—Nearly 50.

18,564. Are you connected with the Old Man's workings there?—It is quite a new field, there are no old workings to speak of. A level was formerly driven before we took on to it, but there were no old workings to interfere.

18,565. What is the longest level which you have driven from the day?—The longest level which goes from the day, which the former company and the present company have driven, is nearly 500 fathoms.

18,566. Are there many shafts communicating with the surface in that distance?—There are two levels from day; there is a level 20 fathoms above the lower one, and there are communications from the lower level to the upper level.

18,567. Are there shafts to the upper level?—No; we sank a shaft, but still it was of no benefit respecting the circulation of air, and it was of no advantage to us in drawing out the stuff.

18,568. So that now the ventilation is between the two levels?—Yes.

18,569. Do you find that quite sufficient?—Yes.

18,570. In what strata are you working there?—Sandstone or grit, and shale between the grit. There are two layers of grit, what we call the top grit and the bottom.

18,571. Do you find any difference in the ventilation according to the strata in which you are working ?—Yes, we do sometimes.

18,572. Which is the worst ?—When we have any great thickness of plate it is not altogether so good as it is in the grit, but there is no great thickness in general, not more than three to four fathoms between the grits.

18,573. Have you ever met with carbonic acid gas ?—We have met with foul air occasionally; it depends upon the atmosphere.

18,574. Can you describe any occasion when you have found carbonic acid gas coming out from the rock?—Yes ; we have just discovered it where there have been openings, or what we call crevices in the rock, and it will escape there occasionally; but then it will depend upon the atmosphere outside whether it has any effect or not, as to whether it is any detriment to the men, it will depend upon the point from which the wind is.

18,575. How do you discover it ?—By the candles not burning quite so well.

18,576. Have you ever heard it ?—We just hear a kind of a singing tone for a day or so sometimes before we should feel the effects of it.

18,577. (*Mr. Holland.*) Hissing out ?—Yes ; just coming out, that has been in the grit.

18,578. You hear it hissing out of the crevice, do you?—Yes, occasionally.

18,579. (*Chairman.*) Before you feel the effects of it ?—Yes.

18,580. Have the men to leave work on that occasion?—They are obliged to sometimes. We never allow them to work in a place where the candles will not burn.

18,581. You judge by the candle whether the air is bad or not ?—Yes.

18,582. What do the men pay for candles at Hebden Moor ?—About 7*d.* a pound.

18,583. How much for powder?—About 3*l.* a hundredweight.

18,584. Have you ever known any men suffer from working in mines?—No, not at Hebden Moor.

18,585. But have you in other mines ?—Yes ; I believe that in some cases they have suffered.

18,586. From your own knowledge do you know of any men who have suffered ?—Yes, from the time that I was a boy; in consequence of their working hard and in wet places, and not having been careful enough of themselves they have shortened their age.

18,587. Have they been broken winded ?—Yes ; it may have that effect sometimes. I have myself worked in places where it was very dusty, in Devonshire ; it was the gray slate strata there, and in some places it was very dry, and there it was worst; but if there was water and it was a wet place it had a tendency to prevent the dust from flying.

18,588. (*Mr. Holland.*) Are these mines as close to work in as the Devonshire mines ?—No; they are not so warm.

18,589. Do the candles burn better ?—No; I do not know that they burn better.

18,590. The difference is chiefly as to the temperature?—Yes; and they are not so deep. I have worked in 50 fathoms to 200 fathoms deep.

18,591. Have you any mines here 50 fathoms deep?—Yes, from the surface.

18,592. Did you ever work in any 50 fathoms deep from the surface in Devonshire ?—Yes.

18,593. Are the levels 50 fathoms from the surface here as hot as 50 fathoms from the surface in Devonshire ?—Yes, I think that they are.

18,594. Is the air similar ?—Yes, just the same, I think, when the same thing is laid out for ventilation.

18,595. Is the ventilation as good or as bad as it is in Devonshire ?—Just about the same.

18,596. Do you think that the miners are as healthy or more healthy here than in Devonshire ?—They are more healthy. A greater heat proceeds from a copper vein and also in the grey slate than in lime, from what I have proved from my own workings.

18,597. Do you see much effect from the carbonic acid which comes out when it is not enough to put out the candles ?—No ; but there would be an effect produced if the men worked in it for any length of time.

18,598. When it is not enough to affect the candles, do you think that it affects the men's health ?—I do not know that it does much.

18,599. When there is not enough carbonic acid to affect the candles, does it affect the men in their breathing ?—No, not much in breathing ; it affects the head a little.

18,600. Does it make the head ache ?—Yes, if the men continue to work in it many hours; but when it is like that they do not work long.

18,601. Does it ever gather so completely as to put out the candle if you put it at the bottom of the level ?—No.

18,602. Is your mine very dusty ?—Not particularly.

18,603. Do you think that the dust or the bad air affects the men most ?—Dust is very injurious, and bad air is also injurious; but I may say that they have not any bad air in Hebden Moor.

18,604. But you have dust ?—Yes, in dry places.

18,605. Does the dust make the men cough much ?—I think not.

18,606. Does it hurt them ?—It lodges upon the inside.

18,607. Do not they cough it up afterwards ?—We do not take any particular notice of that.

18,608. What particular injury do you think that it does ?—It may affect the lungs a little.

18,609. Have you noticed that it does affect the lungs ?—I judge from my own experience when I worked underground.

18,610. What effect had it upon you ?—If I worked in it I felt a tightness, a difficulty in breathing, if it was a close dry place.

18,611. How long did it last ?—A good emetic would clear it again.

18,612. But if you did not have an emetic, how long would it be before it would clear ?—Not long.

18,613. How long ?—It might take a day or two.

18,614. And during all that time you would feel a tightness ?—Yes, a little tightness.

18,615. That you think was from the dust ?—Yes.

18,616. Have you observed the same thing from poor air, not dusty ?—No.

18,617. What effect would that produce ?—You would feel a difficulty in breathing it when you were in it, but you would not feel it when you came out.

18,618. Have you felt all the strength out of you after working in bad air for some time ?—I have felt deprived of a part of my strength ; you would not feel so fresh.

18,619. (*Mr. Leveson Gower.*) Do you know any lead mines in Derbyshire ?—Yes.

18,620. Do you consider the men here to be more healthy than the men working in the lead mines in Derbyshire ?—No, I do not think that they are more healthy, because it was limestone in Derbyshire.

18,621. (*Sir Philip Egerton.*) How many levels have you ?—We have two that go in and come out at the surface, but we have three inside.

18,622. In which are you working now ?—What we call the low bottom and the middle level.

18,623. Do you find any difference in the air in the middle level and the lower level ; which is best ?—It depends upon the distance which is driven. At this time we have good air in both levels.

18,624. What distance are you working now from the air shaft ?—One level is in about 40 fathoms, and the other about 30.

18,625. Is the ventilation natural, or do you use artificial means of ventilation ?—It is natural.

18,626. And it is very good in both levels ?—It is pretty good.

18,627. Which is the best ?—At this time the middle level is best, although it is extended the farthest.

GRASSINGTON.

Mr. T. Job.

5 March 1863.

18,628. Has the air in the middle level been heretofore bad ?—No.

18,629. Never ?—Occasionally when the damp has come out. When the gentleman came here to test the air, we could not carry a candle in the level.

18,630. What do you mean by "damp"?—The foul air coming out through the crevices.

18,631. That is your name for the foul air which you have described in your evidence ?—Yes.

18,632. (*Mr. Holland.*) Do you call it cold damp ?—No, we call it damp.

18,633. (*Sir Philip Egerton.*) But you do not feel any ill effects from that now where you are working in the middle level ?—No.

18,634. (*Mr Kendall.*) How long have you abandoned work on account of the damp ?—I think two days.

18,635. Have you ever abandoned it before on the same account ?—Yes.

18,636. How frequently ?—We have had to abandon it twice since January, for about two or three days each time.

18,637. After two or three days is the air very good ?—Yes.

18,638. After this oozing out ceases ?—Yes.

18,639. Have you worked in Cornish mines ?—I have worked in Devonshire the adjoining county.

18,640. Are you a Devonshire man ?—Yes.

18,641. Are the wages higher here than in Devonshire ?—At this time the wages are much the same as they were when I left Devonshire.

18,642. Are the miners more sober here than they are in Devonshire, or just the same?—Just the same.

18,643. Do they live better here than in Devonshire ?—I think not; their diet is different from what it is in Devonshire.

18,644. Which do you think is the best diet, you having tried both ?—In Devonshire they use fried potatoes and bacon; but here they make use of porridge made of oatmeal; it is a very good food, but I do not make much use of it myself, I eat a little oatcake.

18,645. What age are you now ?—58.

18,646. How old were you when you began working as a miner ?—12 years.

18,647. Do you find yourself strong now ?—Yes.

18,648. You are as able to do your work as another agent ?—Yes.

18,649. You can go up and down anywhere ?—I cannot go quite so well as I could ten years ago.

18,650. Can you go any depth now ?—I cannot go any depth.

18,651. How deep do you go down ?—Our mine is not very deep; we have the benefit of going in the levels.

18,652. Still you are strong and healthy ?—Yes.

18,653. (*Mr. Holland.*) Should you like to climb 200 fathoms ?—No, I found that enough before I left Devonshire; 22 years ago.

18,654. (*Sir Philip Egerton.*) Do you like ladders or stemples ?—Ladders.

The witness withdrew.

Mr. JAMES RAY EDDY examined.

Mr. J. R. Eddy.

18,655. (*Chairman.*) I believe that you are the Duke of Devonshire's mineral agent ?—Yes.

18,656. For which mines ?—For the Grassington and the Cononley mines, the Duke works, and his mineral property generally.

18,657. Have you charge of other mines in other parts ?—I have charge of the Snailbeach lead mines in Shropshire, about 12 miles south-west of Shrewsbury.

18,658. Are they large workings ?—Very large.

18,659. Have you during all your life had more or less to do with mines ?—I have been here continuously for ten years, before that I was three years with a civil engineer, and before that again I was with my father in the office.

18,660. (*Mr. Kendall.*) Your father held the same situation as you now hold ?—Yes; he was the mineral agent to the Earl of Burlington and the Duke of Devonshire before the titles became merged. I also manage the Alport mines in Derbyshire for a company, and the Burlington slate works in North Lancashire for the Duke; the Duke works the latter himself.

18,661. (*Chairman.*) You smelt the ore at Grassington ?—Yes; we smelt all the ore here, and do likewise at Cononley and at Snailbeach.

18,662. You have turned your attention particularly to the smelting ?—Yes; I paid particular attention to the smelting in the early part of my time here.

18,663. Do you think that it is very efficiently done ?—I believe that the smelting at Grassington is as perfect as it is possible to make it, indeed it is acknowledged by large smelters to be better than theirs; but it arises from the simple fact that our men here have been for so long a time accustomed to one class of minerals only that they are quite masters of the thing, whereas at other works where they buy all classes of ore, it is a continuous change.

18,664. Do you work by water power or by steam power ?—At Grassington it is all water power; at Cononley there is one steam engine for winding, crushing, and pumping.

18,665. You make extensive use of the wire rope ?—Most extensive.

18,666. For all your drawing ?—Yes.

18,667. And for drawing at all angles ?—Yes. I have brought with me specimens of different wire ropes which have done service. This rope (*producing a specimen*) has six strands of six wires, No. 12; it is one of Newall's, made in 1844, it has let down about 200,000 tons upon a self-acting incline, 60 yards short of one mile long, independently of the waggons, which would amount to about 18,000 tons besides. That rope never broke in 14 years workings. We took it off thinking that it had done enough duty. I have tried to keep within the mark in the figures which I have given, and I think that it would turn out to be more if properly gone into.

18,668. Your experience of wire rope is that it is more economical to use than chains ?—There is no comparison.

18,669. And how is it with regard to hempen ropes?—We could not work hempen ropes where we work these wire ropes on account of their dead weight. In the rope which I have produced there are six strands of six wires, No. 12, that is what we used to work formerly. The centre core is hemp, they now sometimes make them of a mixture of gutta percha and hemp, which I believe works pretty fairly.

18,670. You find no difficulty in working it with an angle ?—None. This rope (*producing another specimen*) is a six strand rope, No. 12 likewise, but there is a peculiarity about it which I do not think advisable, In two opposite strands they have inserted instead of a hempen centre, a wire centre, I do not think that is advisable. If that rope was closely examined I believe it would be found that the twist in it in the course of working would not be uniform, in other words, I think, that by placing the extra wire in it, the rope has greater rigidity in a certain position than in any other. That is the argument which I go upon; I have not examined the rope, but I think that would be the result. This (*producing another specimen*) is a new rope which has not done any work.

18,671. Which do you think more durable and safe, flat wire rope or a round rope ?—Weight for weight, decidedly a round one.

18,672. Will you state your reason for that opinion?—My reason for it is this, that taking it weight for weight, it is the faggot of sticks exemplified. In a flat rope you have so many pieces of roundish ropes stitched together, so that the whole load is never

borne uniformly upon every part of that rope. In a round rope it is always borne uniformly by every single wire; but in a flat wire rope the strands will never bear at any two different moments exactly the same load, it is tearing at one side or the other. We work a flat rope at Snailbeach, in a shaft more than 400 yards deep. The rope with the two wire cores in it has drawn at Grassington mines during nine years certainly not less than 10,000 tons, besides the dead weight of the kibble. That part of the mine is exhausted. Of the two ropes which I have produced one has been drawing perpendicularly and the other at an angle.

18,673. (*Mr. Kendall.*) Do you get these ropes all from the same manufacturer?—No; formerly we got all from Newall's. My father was perhaps the first person that ever used a wire rope in a mine.

18,674. How do you manage now?—We have changed and find a material improvement. I know that all the Cornish ropes are from Henry Morton, of Leeds, and I have no reason to complain of them, because I have never tried them. I get ropes now from Garnock and Bibby, of Liverpool, and am trying one from Edge and Son.

18,675. (*Chairman.*) If anything gave way in the wire rope, at what point would it give way?—We have had the greatest difficulty (I am speaking now of those years when we knew less about wire rope than we do at the present time) at places where we wanted to make connections on the one hand with two lots of rope, or on the other for attaching the tail chain to the rope. We put on a thimble, and the difficulty has arisen when the neck of the thimble pressed hard on the rope. If the thimble went over the pulley-head (under the above circumstances), we sometimes used to neck the rope, and it would go away from the thimble before we knew any- thing about it; but with care and observation we have been able to get over that difficulty; we have not necked one for the last five years and a half, which is a proof that the safety is comparatively certain.

18,676. With a continuous wire rope you would think that there would be no danger?—We never lost the coupling off that rope (*pointing to one of the specimens*); we once broke a piece away from this rope (*pointing to another of the specimens*) working in a shaft 57 fathoms deep, by plucking at the sheeting and dividers; but we never broke that rope anywhere but at the coupling, so that there are two ropes there which have drawn together about 240,000 tons without a break.

18,677. (*Mr. Holland.*) Will you describe the improvement of the thimble?—Our mode of putting on the thimble is this:—If we put on the thimble to this rope we should separate and open the strands of the rope. Having done so we should bend every strand back over as near right angles as possible, for a length of about 8 or 9 or 10 inches, depending upon the kind of coupling which we were going to put in. A coupling for connecting ropes is usually put in longer than one which should pass over a pit-head pulley, though we always take care if possible so to arrange the chain and the landing place that there shall be no occasion for the coupling to go over the pit-head pulley. We then wrap the whole with old hempen rope, putting the greatest covering of wrapping on to that part of the rope on which the sharp ends of the thimble would bear. The thimble is made in two wings, connected together and riveted through the rope with four or five rivets, care first having been taken to chamfer back the inside of the ends of the iron wings. The iron embraces it in two arms, and we take care to chamfer back the inside of the end of the iron, so that if there should be a bend of the rope it allows a little play before the sharp end of the iron touches it. We never dragged one; that is to say, we never tore a thimble off, which shows that the system of putting it on is sufficiently strong.

18,678. (*Chairman.*) In the angles and ends what course do you adopt to prevent the wearing of the rope?—We have small pulleys.

18,679. You find that quite sufficient?—Quite sufficient.

18,680. So that that rope would be used at any workable angle, although a curve of a small radius would render the use of a wire rope impracticable?—At any workable angle. As a proof of that, at the Burlington Slate Works upon one of the shorter inclines (not the one to which I alluded before) there are two reverse curves, and speaking without having measured them, I take it that one curve is of as small radius as 30 feet, and the other is perhaps of 45 or 50 feet radius, which is very sharp. They are self-acting inclines.

18,681. (*Mr. Kendall.*) That they bear?—Yes.

18,682. (*Mr. Holland.*) How many pullies do you want to turn that curve; three?—We put as many as are necessary; we have no rule for that. We are forced to put them to the outside of the inside rail. This is a plan of the lines of wire rope now in use at these mines (*producing the same*). It is on a scale of 40 yards to the inch. There is no other mine in the world which has used so much wire rope as this mine; and I think I can say that no other person in the world uses more wire rope than I do. We have been drawing at Grassington mines from one shaft 960 yards from the machine; that is the length of the rope on the surface in a straight line, independently of the angles, and the depth of shaft is 120 yards more. We have been drawing at another shaft 1,320 yards, and at another nearly 1300 yards, besides angles and depth of shaft.

18,683. (*Mr. Kendall.*) Did you ever work that distance with a hempen rope?—No; the furthest that we ever worked with such a rope was 640 yards. I believe that it was with a hempen rope; but it was before I remember.

18,684. (*Mr. Holland.*) Have you ever worked out the fraction of loss?—No; but my father did so very minutely, and the difference between hemp and fire rope is so great, that it does not admit of the slightest comparison. In working at the furthest shaft the men have a signal made to them twice in the morning only. A hempen rope would with the alternations of wet and dry, and with the day's work have altered in length some feet. We could not have drawn back the hempen rope on account of the weight. The small wire ropes weigh about 6 or $6\frac{1}{2}$ lbs. to the fathom; they come to us about 3 inch ropes, and the one which has been working nine years is drawn down to about $2\frac{1}{4}$ inches. In the new rope we have improved it; we find it advisable, instead of having six strands of six wires, of No. 12 wire, to increase the number of wires and reduce the strength of each wire; and we now work them with six strands of eight wires, of No. 13 gauge.

18,685. (*Chairman.*) What is the price of these wire ropes?—They are 38*s.* a cwt. at the present time.

18,686. (*Mr. Kendall.*) What does a fathom weigh?—A fathom of that rope will weigh, I think, about $7\frac{1}{4}$ or $7\frac{1}{2}$ lbs. By increasing the number of wires, it increases the weight a little; the $3\frac{1}{2}$ inch wire new will weigh $9\frac{1}{2}$ lbs. per fathom.

18,687. (*Mr. Leveson Gower.*) You are agent to mines in different counties; you have mentioned four different counties?—Yes.

18,688. With regard to the health of miners, do you see any difference in those different mines?—The most healthy miners that I know are the Shropshire and the Derbyshire miners. I think that we have the least chance in the north of England; I am omitting altogether Devonshire and Cornwall. I think that the ventilation at Grassington, and the size of the levels, and all that sort of thing, have been on a better scale than in other mines in the north; but the small mines in the valleys between here and Alston Moor have, generally speaking, been carried on by small companies who would not spend money. Thirty years ago, when my father came here, a great part of these mines were worked by small companies, Derbyshire companies, and north country companies; and a great part of the miners came here originally

GRASSINGTON.
Mr. J. R. Eddy.
5 March 1863.

from Derbyshire and the north country. The late Duke then took all the royalties into his own hands: and we have constantly had from time to time, in going over any of the old works, to enlarge their levels. It is not seven years ago that we opened out more than 90 fathoms of one level, which at that time was not more than 3 feet 6 inches high and 2 feet wide; and a man worked in that level nearly all his time, who stood 6 feet 1 inch high.

18,689. Do you believe that those small levels still exist in this neighbourhood?—Yes, in the small mines; they do not exist in this immediate neighbourhood in the present workings, but they are existing in the old mines as old works.

18,690. Do you think that there are any mines in operation at this moment near here with such small levels as those?—There are levels which are too small; but I think that that is not so general as it was. Mr. Taylor, of London, who works the Derwent mines, is very particular about large levels; and we have mostly here made what we consider pretty good sized levels, and I think that the other mines are following that.

18,691. To what do you attribute the better health of the Shropshire and Derbyshire miners as compared with the miners of this district?—The health of the Shropshire miners is better than the health of the Derbyshire miners, from the fact that they have no shales, no argillaceous beds, or very little. For instance, in Snailbeach, in Llandeilo Flags, there are no soft argillaceous beds in the working part of the mine. In this district I do not think that there is anything to damage the men's health, save boring in the grit stone; that is the bane of this country; and I believe that what I am trying to get the men into at the present day, namely, wearing a moustache, is the only preventive, and I would say the only sure preventive for it. The gritstone causes the mines of this county to be less healthy than those of the two counties named.

18,692. (*Sir Philip Egerton.*) You encourage that in the miners?—I do; but you will not find many of them wearing it.

18,693. (*Mr. Leveson Gower.*) Are there many miners who are teetotallers?—We have not many teetotallers here; but I think that we have a less percentage of drunkenness than among any body of miners I ever knew. I am quite certain that we have less than among any body of miners I ever came in contact with.

18,694. Do you consider that there has been an improvement in that respect since you knew the district?—There has been an improvement resulting from temperance.

18,695. (*Sir Philip Egerton.*) Since you have been acquainted with this district, can you trace any improvement in the health of the miners; do you think that they are more healthy now than they were when you first came here?—I can see this very plainly, that those miners who have for the last ten years suffered the most from their working, and also those miners of the present day, who one would say are the worse for it, are men who originally worked in Arkindale and the northern country. We have in attendance here one man who has been working 57 years; all the men who are in attendance here have been working more than 30 years, and some of them are not more than 42 years of age; the youngest went underground at 7 and from that to 12 and 14, and I think that they are a very good sample; I am not at all afraid of showing them anywhere.

18,696. (*Mr. Holland.*) Are those whom you have here selected men?—No; they are those who have been longest in the mine, whose length of time of working has been my guide.

The witness withdrew.

Adjourned.

DEVON GREAT CONSOLS MINES.

Tuesday, 26th May 1863.

PRESENT:

The Right Honourable Lord KINNAIRD, K.T.
Sir PHILIP GREY EGERTON, Bart., M.P.
The Honourable E. F. LEVESON GOWER, M.P.
NICHOLAS KENDALL, Esq., M.P.
JOHN ST. AUBYN, Esq., M.P.
RICHARD DAVEY, Esq., M.P.
P. H. HOLLAND, Esq.

The Right Honourable Lord KINNAIRD, K.T., in the Chair.

Mr. THOMAS MORRIS examined.

DEVON GREAT CONSOLS MINES.
Mr. T. Morris.
26 May 1863.

18,697. (*Chairman.*) You are resident director of these mines?—I am.

18,698. What number of men are employed under ground?—About 500.

18,699. And how many on the surface?—Boys and girls about 450, and 250 men, making 1,200 altogether.

18,700. How many shafts are there?—11, and two footways.

18,701. At which part of the mine are the principal workings?—Wheal Josiah, Wheal Anna Maria, and Wheal Emma.

18,702. Which is the deepest level?—Wheal Josiah; 212 fathoms. We are now sinking below the 212 fathoms—two or three fathoms merely.

18,703. How do the men ascend and descend?—By ladders. Our working has been very small comparatively at the 212 fathoms; in fact, we have had no ore from the 140 fathoms down to the 212 fathoms, but now we fancy that we are riding on a course of ore at the 212 fathoms, and therefore we are now resuming our operations there by sinking the shaft, driving the levels, and putting down a winze.

18,704. At the 140 fathoms, therefore, are your principal workings?—At this shaft, from the 60 to the 140 fathoms.

18,705. Is the power chiefly water power?—Yes; pumping by water power and hauling by steam; four steam engines.

18,706. In hauling do you use a wire rope?—Yes; and steel for some. We have only lately introduced it, and we find that it answers very well.

18,707. Do the men ever go down by the kibbles?—Not that we are aware of; that would be a fine.

18,708. Do you use the skip or the kibble in hauling?—Both.

18,709. Then it is by an incline?—By a railway, and guides.

18,710. Have you any levels at the lower part of the mine running out to the surface, to the water levels?—No.

18,711. Is the whole of the water pumped?—Yes; chiefly water power and one steam engine.

18,712. Are there any levels wetter than others?—Yes. We generally leave them; we have so much ground open that we can do that. Where the levels

are very wet they are left until we get below them in order to drain; that we do with great economy.

18,713. Do you know which is the wettest level at which you are working?—I should say Wheal Emma at the 130 fathoms, at the eastern part of the mine, at present.

18,714. Is there any age to which the boys are limited in going underground?—Very much depends upon their size, because some boys are as big at 10 as others would be at 12; we do not let very little boys go underground.

18,715. Do the women work under cover?—Yes.

18,716. Is there any separate refreshment house for the women to go to?—Yes.

18,717. (*Mr. Kendall.*) Are Wheal Anna Maria, Wheal Maria, Wheal Fanny, Wheal Josiah, and Wheal Emma all under the same Company?—Yes.

18,718. What is the object of giving them separate names?—Merely to give them a name; we began with that system; we might just as well have called them A and B, or 1 and 2.

18,718*a*. The same parties hold the same shares in all?—Yes. We commenced in 1844. (*See* 18,724.)

18,719. You have no man-engine in any part of the mine?—No.

18,720. Have you it under contemplation?—At the 212 fathoms it has been a query with us whether we should abandon it, till lately; but the prospects are now so good that the probability is that we shall put a man-engine down there, and a perpendicular shaft, and a steam engine.

18,721. Has the subject of having a man-engine been discussed again and again in the mine?—No, because we are not sufficiently deep for it at any other point but the 212 fathoms.

18,722. You fancy that at a certain depth you should have a man-engine?—Yes; we should put one down at the 212 fathoms immediately if we get a course of ore, otherwise it would have been abandoned.

18,723. You have given the matter a great deal of consideration; at what period, generally speaking, of a mine's depth do you think it wise to begin to use a man-engine?—I should say from the 150 fathoms to the 200 fathoms. Much depends upon the nature of the men that you employ; we want a large quantity of work done in these mines, and our men are chiefly young men; young men, of course, are more able to climb the ladders than middle-aged men would be.

18,724. Your mine has been established some time, in 1844; if you started with young men you must after a while have a fair share of aged men?—Yes, we have some old men; but if we take on any fresh men we generally contrive to have young men.

18,725. Your impression is that on the whole it would be cheaper and better to work a mine till it is 150 fathoms deep before having a man-engine?—Yes; I should not think it necessary before arriving at that depth.

18,726. You do not think that the wear and tear of the men is much before that?—No; our men are very healthy.

18,727. (*Mr. Holland.*) At what age do you consider a man young?—From 20 to 30.

18,728. What becomes of them when they get above 30?—According to circumstances, employed at surface, or shallow parts of the mine. We have some few men now who have been with us from the commencement, that is 19 years.

18,729. What becomes of the men when they become old?—Some go away; others employed at surface. We lose our men occasionally; they go abroad, or to other mines where they can get better pay.

18,730. Your mines are not deeper than mines usually are?—No.

18,731. Do they leave your mine because they must climb there?—They leave occasionally from various causes. I can scarcely tell you from what cause.

18,732. Am I to understand you that when your men get above 30 they find the climbing too hard for them?—No, I should say not; but still our work is hard; we require them to keep constantly at it, and therefore we select young men as a general rule.

18,733. (*Mr. St. Aubyn.*) Have you any data upon which you can tell the average age of the men employed underground in the mines?—Yes.

18,734. What is it?—I cannot tell you without referring.

18,735. (*Mr. Davey.*) Have you not many men working underground above 30?—Yes.

18,736. Up to 40?—Yes; some 50, and some very good men too, and more than that probably.

18,737. (*Mr. St. Aubyn.*) Can you state the percentage of sick of those men working underground?—I find that it is 3 per cent. for the last three years.

18,738. (*Mr. Leveson Gower.*) Do you consider the health of the men affected by climbing?—I should conceive not much in these mines.

18,739. You have never perceived it?—No, not much; if we did we should put them to work at a more shallow level, say down at the 30 or 40 fathoms level, or something of that sort, instead of going down double that depth, or at the surface.

18,740. Then your object in putting up a man-engine is to save time, and not with reference to health?—To save the men as well, of course, and also to get the most work out of them.

18,741. Is the engine which you propose to put up a double or a single engine?—We have not sufficiently considered that point; we should not do that unless we got a course of ore there below the present run of ore ground.

18,742. Which do you consider most desirable?—I really do not know at present. There are various descriptions of man-engines, I believe, and therefore we should try to get the best.

18,743. (*Sir Philip Egerton.*) How many hours do the men work underground here?—Eight hours.

18,744. Does that include the time of going up and down?—Yes.

18,745. How long does it take your men to come up from the 212 fathoms level?—About half an hour up, less to go down.

18,746. Say one hour in going up and down?—Yes.

18,747. Then you lose an hour's work as compared with a man-engine?—Yes, deducting the time a man-engine would occupy.

18,748. In addition to the time which you would gain, the powers of the men would be more husbanded by going down by a man-engine?—Yes; there is no question that it would save a great deal.

18,749. And your calculation is that for anything below 150 fathoms a man engine would pay?—I should think it would, but I would prefer taking the advice of practical men.

The witness withdrew.

Mr. JAMES RICHARDS examined.

18,750. (*Chairman.*) You are the managing agent of these mines?—I am.

18,751. How long has the working of the 212 fathoms level been resumed?—About 12 months.

18,752. About how many men are now working there?—Twelve; six in the shaft and six in the drivage.

18,753. They are working at eight hours' shifts?—Yes.

18,754. How long do the men take to come up from the 212 fathoms level by the ladder?—I have never timed it; perhaps half an hour.

18,755. Are the men ever paid more for working in that level than in another?—Yes.

18,756. They are working by tutwork ?—Yes.

18,757. Are they young men ?—Yes, principally young men.

18,758. What is the next deepest shaft to the 212 fathoms ?—The 175 fathoms.

18,759. How many men are working there ?—None are working below the 157 fathoms.

18,760. How many men have you working there ?—Six.

18,761. Where are the greatest number working ?—About the 60, 80, 90, 103, and 115 fathoms levels.

18,762. What is the furthest point at which you are working from any shaft or winze ?—20 fathoms, as nearly as I can remember.

18,763. At what level is that ?—103 fathoms east of the Field shaft, I think. It is not so much as 20 fathoms.

18,764. You were working at a greater distance a short time ago, were you not ?—Yes, a little more than that, not a great deal more.

18,765. And you have now holed to a winze ?—Yes.

18,766. Was the air at all poor when you were holing ?—No ; it became warm, 65°.

18,767. Did you ever take the temperature ?—Yes.

18,768. What was it ?—65°.

18,769. Did the candles burn well ?—Yes.

18,770. You have no occasion to use any artificial means for putting in air at any of the levels where you are now working ?—None ; we have applied the air pipes now and then with waterfalls.

18,771. You have none at work now ?—No, but we have had them just when we were communicating to a winze.

18,772. Do you use iron pipes or zinc pipes ?—Wooden pipes.

18,773. Have you a plentiful supply of water always, to apply the waterfall to any part of the mine when you want it ?—Always ; we take it from the lift in the shaft if we have not it otherwise.

18,774. So that you can always apply the water power ?—Always.

18,775. Are the men limited to any quantity of candles ?—Yes ; a pound and a half to each man.

18,776. What do they pay for candles ?—8*d.*

18,777. And how much for powder ?—8*d.*

18,778. What other items appear in the bal bill ?—Smith-cost, and powder cans, and the safety fuse.

18,779. Do you always use the safety fuse ?—Always.

18,780. Have you ever had any accidents from blasting ?—Yes, some.

18,781. How do you think that that arises ?—From careless tamping.

18,782. Do you supply the tamping materials ?—Yes. There is always plenty to be found in the mine.

18,783. Have the men to take it with them ?—Yes. They use the mallet instead of the hammer in some cases where accidents have happened. Since the first or second accident we have used copper for tamping bars.

18,784. Are they merely tipped or cased with copper ?—They are shod with copper ; the upper part is iron.

18,785. Is it hard enough ?—Quite ; it is not necessary to use a hard substance for tamping.

18,786. Do you think that there would be no danger of fire if merely the point was covered with copper ?—It would be quite sufficient.

18,787. Would not the rubbing of the iron part of the bar against the side be likely to cause a spark ?—It would not if the bottom part of the bar is bigger than the upper part. We have had an accident of that kind, but it had been traced to the party looking into the hole with a candle.

18,788. Have you ever had an accident while a man has been using a copper tamping rod ?—No, never.

18,789. Are there any men working by tribute ?—Not a great many, only about a score, I think.

18,790. Where the ore is rich you find it better to work by tut work ?—Yes, it is almost entirely done by tut work.

18,791. Do you find an advantage in having experienced miners or young men as miners ?—Experienced miners.

18,792. Older men are not able to climb so well ?—No, they are not.

18,793. Therefore would it not be an advantage to have the means of bringing them up from their work ?—I dare say it would be from the deep part of the mine ; but we have gone very little depth for several years until now ; the bulk of our work is all above the 115 fathoms. The old men are employed in the shallow part of the mines and in the dry-houses at surface.

18,794. And for that depth mechanical means are not required ?—No. I do not think it necessary to have a man-engine there, where the ventilation is good.

18,795. (*Mr. Holland.*) We were told in the west of Cornwall that copper tamping rods were not perfectly safe ?—We have always found them safe with us.

18,796. What is your rock ?—The clay slate, but the lode is a mixture of caples and mundic and quartz ; that is where the tamping chiefly is ; we do not do much in the country ; our lode is very large. It is my opinion that a copper tamping rod is perfectly safe with proper tamping ; if bad tamping is used I believe there is a danger in using any bar.

18,797. You said that some of your men were working in hot air ?—The highest temperature which we have in any part of the mine is 70°, that is at the very deepest point.

18,798. You have no such temperatures as 90° or 100° ?—No ; the 70° is in the drivage from the shaft, at the 212 fathoms ; in the shaft it is only about 50°.

18,799. Have you any places where the candles will not burn brightly ?—Not any.

18,800. (*Mr. Kendall.*) The 212 fathoms level is suspended for the present, is it not ?—Only for a few days longer.

18,801. In consequence of the temperature ?—No. We are changing the pit work.

18,802. Was not the temperature very high ?—It was 70°.

18,803. Have you not a winze sinking down there ?—Yes.

18,804. How far is the winze down ?—Only 2 fathoms down.

18,805. How deep have you to sink before you communicate ?—We shall sink to the next level, say about 12 fathoms. The shaft and the winze are about the same depth ; they are going together. We have an air-machine now working in the shaft to supply the winze with air ; the shaft is in the country, and the winze is going down into the lode ; we have a powerful air-machine to supply this place. The temperature is nothing like 70° now.

18,806. Is it warm at the 103 fathoms level ?—No ; it is very good air.

18,807. What is the greatest depth that you have ever driven from a winze or any air communication without the aid of a fan or a jet ?—We have driven something like 100 fathoms without any aid but the natural ventilation. There has been no pipe or anything.

18,808. The end has been 100 fathoms from a winze ?—Yes, and the air has been perfectly good.

18,809. Had you any sollers ?—Nothing at all more than the natural ventilation.

18,810. You have gone from a point where there has been a communication with the air, and you have driven 100 fathoms without any jet or fan or soller, or anything ?—Yes.

18,811. What height was your drift ?—Seven feet.

18,812. And how wide ?—Four and a half feet.

18,813. Where was it ?—It was at the 60 fathoms' level, east of Thomas's shaft.

18,814. Can you at all account for that ?—The ground is very good ; scarcely any powder is required,

and the stuff is always taken out of the drivage and put into a waggon and trammed back at once; that is done every hour.

18,815. Is it upon the course of the lode?—Yes.

18,816. The country is slate, is it not?—Yes.

18,817. Is it porous slate; is there a good deal of cleavage in it?—Not a great deal.

18,818. Are there any crevices in it?—Yes, at places.

18,819. Are those crevices connected at all with any other place where there is good air?—No, the ground is entirely new.

18,820. Is the lode rich or poor generally?—Poor.

18,821. Is there any water in the end?—Yes, but not a great quantity.

18,822. When you got to the end of the 100 fathoms, did you communicate?—We then rose something like 40 fathoms more in the same way.

18,823. As I understand you, you went in 100 fathoms?—Yes.

18,824. And at the end of the 100 fathoms you began to rise?—Yes.

18,825. And you rose 40 fathoms?—Yes.

18,826. And you holed above?—Yes.

18,827. And you used no artificial means of ventilation?—We bratticed our rise in the usual way; the two ends were always kept open.

18,828. Did the candles burn freely all that time?—Perfectly; as well as they would now in this room. We were all surprised at it.

18,829. What was the temperature when you began to drive?—I should think 45 degrees.

18,830. And by the time you got into the end at 100 fathoms, it was about what?—About 60 degrees, I think, but I never tried it.

18,831. And it was 60 degrees up to the top of the rise?—Yes.

18,832. How many men had you driving?—Generally four men in the 24 hours; two pairs.

18,833. Were you afraid that more men would consume too much air?—No; but it was not necessary to push it.

18,834. The men worked 16 hours?—Yes.

18,835. Eight hours each pair?—Yes.

18,836. Should you have had any fear, if you had wanted to push it more, in working the whole 24 hours?—Not at all.

18,837. You think that there was quite air enough?—Quite; but in other places we have not been able to go 20 fathoms without artificial means.

18,838. In this mine what distance from a shaft or a winze have you ever known the air foul?—About 20 fathoms is the furthest point that we ever worked without a winze or rise, except at the 60 fathom level east of Thomas' engine shaft.

18,839. Have you ever found the air getting poor at the end of 20 fathoms?—Not poor, but only warm; not foul at all.

18,840. In other mines have you found the air at all foul when driving within 15 fathoms of a winze?—Yes, where a large quantity of timber has been used, and stuff allowed to accumulate.

18,841. Can you give any reason for the goodness of the air in the case which you have before mentioned, which struck you as extraordinary?—Only keeping the level clear of stuff; we always find that a benefit.

18,842. Did it turn out any ore at all?—Not a pound; we have seen a little of it, and that is all; but we have saved none.

18,843. Have you seen a man-engine?—No.

18,844. (*Mr. Davey.*) Mr. Morris said that your ore ceased to exist under the 140 fathoms?—It went down as deep as about the 140 fathom level.

18,845. What was the character of the lode when it changed?—It became more sparry and with caples and a mixture of killas. In the deepest part of the mine it is precisely the same.

18,846. Was it gradual or like a floor?—It was almost suddenly like a flaw.

18,847. In sinking down to the 212 fathoms did it continue pretty much of the same character all the way till you got to the bottom?—Yes, there being less mundic.

18,848. What is the change, now that you are more promising?—There is becoming more quartz, fluor spar, a good deal of mundic, and rich ore.

18,849. Some of the deeper levels on the plan have been driven, have they not?—No, they have not been down to the deeper levels until within the last three or four months.

18,850. (*Chairman.*) At which level are most men working now?—From the 40 fathoms down to the 115; there are very few men below that.

18,851. Have you a communication between all your shafts?—Every one, except the Wheal Maria shaft; we can walk three miles underneath.

The witness withdrew.

Adjourned to To-morrow, at Tavistock.

TAVISTOCK.

(*Note.—The evidence previously taken at Tavistock will be found at page* 294.)

Wednesday, 27th May 1863.

PRESENT:

The Right Honourable Lord KINNAIRD, K.T.
Sir PHILLIP GREY EGERTON, Bart., M.P.
The Honourable E. F. LEVESON GOWER, M.P.
NICHOLAS KENDALL, Esq., M.P.
JOHN ST. AUBYN, Esq., M.P.
RICHARD DAVEY, Esq., M.P.
P. H. HOLLAND, Esq., M.P.

The Right Honourable Lord KINNAIRD, K.T., in the chair.

Mr. JOSEPH MATTHEWS examined.

18,852. (*Chairman.*) Will you state the names of some of the principal mines with which you are connected?—The principal mines with which I am now connected are Wheal Friendship, Birch Tor, North Wheal Robert, and Wheal Russell.

18,853. What is the kind of ore?—From Wheal Friendship the principal produce is copper; there is a small quantity of tin. Birch Tor is tin, and North Wheal Robert is copper, and very recently tin ores.

18,854. Can you state the number of men employed on Wheal Friendship?—I cannot from memory; but I think it is about, underground men, 72; underground boys, 51; trimmers, fillers, &c., 12.

18,855. Is it fully at work now?—Yes.

18,856. Has there been any part of the mine inundated lately?—Yes.

18,857. Can you state from what cause?—The cause of the inundation has been a choke. There is

Tavistock.

Mr. J. Matthews.

27 May 1863.

a communication between Wheal Friendship and a mine called Wheal Betsey. A choke in the adit level had dammed back the water in a pretty considerable quantity into Wheal Betsey, and about three weeks ago this choke gave way; the water came back through the adit, and got into the mine.

18,858. Were there any people at work in the mine at the time?—No; it happened fortunately on Sunday.

18,859. If had happened on another day, would any lives have been lost?—I do not know. I should think that there would be no danger of any loss of life. There were so many ways of escape open at the places where men were at work that this would be scarcely probable.

18,860. Is it pumped out now?—No. It happened that just about the time when the accident occurred we were putting up a water wheel which had got into a bad condition, and therefore we can do nothing in pumping until that engine is put to work.

18,861. Do you know about the number of shafts which there are?—Six principal shafts, and two inclined planes.

18,862. What is the greatest depth?—240 fathoms under the adit.

18,863. What is the deepest level which you are now working?—At the present moment about 180 fathoms.

18,864. Is the water below that?—Yes.

18,865. On which lode are the men now principally working?—The principal workings are upon what we call the main lode, and Kent's lode.

18,866. What level is it in?—The 240 fathoms is the deepest which we have been working.

18,867. What other levels do the men work in?—There are men working at several levels above the 180 fathoms level, at 150 fathoms, and 100 fathoms, and several other levels.

18,868. Is the air quite good in 150 fathoms level?—I hear of no complaint anywhere. In the 150 fathoms level we have not had very good air, and we are now putting in a machine there by which the air will be improved; but I believe that generally the mine is very well ventilated.

18,869. The machine is not in at present?—I think it is not in yet.

18,870. What distance from the shaft is the end of the level carried?—I think it may be as much as 120 or 130 fathoms; but I speak quite offhand.

18,871. What kind of machine do you propose putting in there?—I cannot tell you that.

18,872. How do the men ascend and descend?—By ladders.

18,873. Is it a perpendicular shaft or an incline?—They are underlie shafts. There are two inclined plane into the mine.

18,874. But the other shafts are underlie shafts?—Yes.

18,875. Do the men come up the inclined plane?—No, none; we forbid their going up and down by the inclined planes under penalties.

18,876. Is the inclined plane used for drawing?—Entirely.

18,877. Do you draw by kibble or skip?—By skip (both).

18,878. With guide rods?—We have no guides, but there is a rail all the way. The men are not allowed on any account to go up and down by the rail.

18,879. Do you suppose that they do?—I think not.

18,880. Have you had any accident lately?—No; I think that we have had no serious accident there for several years; I do not recollect any.

18,881. No accident from blasting?—Neither from blasting nor from any other cause.

18,882. Have you changing houses at the footways?—We have changing houses on the mine.

18,883. Near the footways?—Yes.

18,884. Do any of the men change in the boiler-house?—We have no boilers. We have no steam engines at work.

18,885. Are the men allowed a certain quantity of candles per week?—Yes; I believe as a rule about 2 lbs. per week per man.

18,886. Do you know what the men pay for candles?—Yes; we have charged 7*d.* a pound for candles.

18,887. And how much for powder?—For powder the same.

18,888. Do you know what the cost price is?—The present cost price of candles is about 5*s.* per dozen pounds.

18,889. Is a deduction made for club money—Yes.

18,890. Is it for visible hurt, or does it include sickness?—We have a sick fund to which the men contribute; in case of hur they are paid by the mine in addition.

18,891. Does the money which the men contribute go to the sick fund?—Yes.

18,892. Does a part of it go to the club fund?—No; in case of hurt it is paid entirely by the mine.

18,893. Does the attendance on the sick include their families, or only the men?—The men and their families till they go to some work.

18,894. Is there a doctor appointed to the mine?—No; we appoint no doctor, but we leave the choice of the doctor to the men themselves, so that any man may choose what doctor he pleases, and each doctor is paid in proportion to the number of men that he attends.

18,895. How often is the pay of the men?—Twice a month; we have subsist and pay.

18,896. Do you pay in notes or in change?—All in small money; we pay no notes.

18,897. (*Mr. Holland.*) Then they can divide their money without going to a public house?—Yes. We always pay in such a way, that if we pay to four men 10*l.*, we give them 2*l.* or 3*l.* of silver, so that they can divide their money without going out of the mine.

18,898. (*Mr. Kendall.*) You have generally acted as purser of a mine?—Yes.

18,899. Almost always?—Yes.

18,900. You have never taken any management?—I have never taken any underground management.

18,901. You have been purser of mines for a great number of years?—40 or 50 years.

18,902. You not only know the Devonshire mines, but you know the Cornish mines a great deal?—Yes, some mines about St. Austell.

18,903. You have been a good deal mixed up with mines in the neighbourhood of St. Austell?—Yes.

18,904. Do you know much about the condition of the miners on the surface, their mode of living, and so on? Do you visit them much?—I see them and know their gettings. The general getting is about 2*s.* 4*d.* or 2*s.* 6*d.* a day.

18,905. Is the condition of the miners better now than when you first knew them?—Very much better.

18,906. Taking them as a body of men, are they more careful than they used to be?—I think so, very much.

18,907. More temperate?—More temperate.

18,908. Are accidents so frequent as they used to be?—By no means; the number of accidents from gunpowder are, I think, reduced two thirds.

18,909. I suppose the adventurers take more care in the appliances which they use?—We do all we can to render their work as little hazardous to life as possible.

18,910. Did you ever attend any inquest?—Never.

18,911. With regard to the surface accommodation, the changing houses, and so on, has there been much improvement in that way since you recollect?—Very much. In the first place, in all our mines we have dries, where the men's clothes are always dried for them before they go underground, and where, if they take off their wet clothes, they are dry by the time they come from underground; and that, no doubt, would very much conduce to their health.

18,912. With regard to their accommodation in their own houses, do as many sleep in a house as used to do, or not?—I think that, as regards those who live in town, there is a very great improvement in that respect; but in the country, I think, most of the families have two bedrooms and a room downstairs for cooking, and so on.

18,913. Can you speak as to the lodging of miners, whether, when a man is married, several men lodge with him, and whether two men sleep in a room?—I don't think that this prevails amongst miners working at Wheal Friendship, whether they live in town or in the country.

18,914. You cannot speak as to overcrowding?—I do not think that there is anything of that kind.

18,915. In any of your mines is there any arrangement for the separation of men from women during meal times, or things of that kind?—I think at Wheal Friendship the principal part of the girls reside very near the mine, and they generally go home to their meals.

18,916. There is no particular accommodation that you know of, either for the men or for the women, at meal times?—I do not think that we have at Wheal Friendship anything of that sort, but there is ample accommodation there for any few who may not go to their own homes to their meals; dinner, indeed, is the only one. [I take this question to apply to surface labourers.]

18,917. Have you changing houses there?—Yes.

18,918. And dries for the clothes?—Yes.

18,919. (*Mr. Holland.*) Has there been any other cause for the great diminution of powder accidents, except the increased carefulness of the men?—I think that the use of the patent fuse has very much tended to diminish accidents.

18,920. Is there any objection by the miners to the use of the patent fuse?—I have never heard of any. I think it would be very difficult to get our men to return to the old modes of "firing" their holes.

18,921. Is the smoke which it makes a serious objection?—I have never heard of any, except where ventilation is bad.

18,922. (*Chairman.*) Do you go down the mine?—Never.

18,923. Therefore you cannot speak as to the temperature of any of the levels?—I cannot.

The witness withdrew.

Mr. Richard Sleman examined.

18,924. (*Chairman.*) You are a surgeon?—Yes.

18,925. Resident at Tavistock?—Yes.

18,926. Have you the special charge of any mines in the neighbourhood?—Not the special charge, because in our locality the miners choose whom they please.

18,927. Have you many miners who come to you as patients?—Yes, a great number.

18,928. Those for sickness are paid for by the club money?—Yes.

18,929. What arrangements do you make with the miners for attendance?—We attend the men and their families; they pay 9*d.* a month.

19,930. Not all those who choose to come to you?—No; all those working at the mines pay 9*d.* a month.

18,931. Do they pay you?—No.

18,932. How are you remunerated?—We receive the money from the purser, the money being deducted from each man's pay.

18,933. But you receive according to those who come to you?—No; every man working at the mine is obliged to pay 9*d.* a month, whether he is married or single; we receive that 9*d.* through the purser.

18,934. You receive from the club money according to the number of men who choose to apply to you for medical assistance?—Yes; that is the custom of our neighbourhood.

18,935. The men select the surgeon, and the surgeon is paid for the number who come to him?—Not for the number who come to him, but the number on the list for the surgeon.

18,936. Is that for the year or for any limited period that the men select?—That depends upon different mines. In Wheal Maria the selection is once in three months, but in Wheal Friendship and some other mines the men have the power of selecting when they please; for instance, if I give dissatisfaction to a man he has only to go to the purser and have my name struck off the list and another substituted.

18,937. When is the settlement with you by the mine?—There is a little irregularity; it depends very much upon the character, perhaps, of the purser. At Wheal Maria we receive once in six months; at Bedford United once in three months, and at Wheal Friendship once in six months. In small mines we are anxious to receive more frequently, because otherwise we may lose the money, and I am told that in law we cannot recover more than a month. The Stannary Court tell us so, and therefore in small mines we look a little more after it.

18,938. In case of accident, how are you remunerated?—The 9*d.* covers everything except midwifery and vaccination—every ordinary sickness.

18,939. What are the principal disorders for which the men apply to you for medical relief?—When you are speaking of the district, that depends a good deal upon the portion of the district; for instance, at Mary Tavy, in consequence of the habitations of the miners being adequate to the population, we do not get much fever. If you go to Beer Alston, where the number of houses is the same, but where the population is 2,000 as against 500, you get more fever and more disease generally, and so at Gunnislake. I believe that the disease depends more upon the habitation of the miner than anything else.

18,940. By "disease" do you mean fever?—Yes, and general disease. With regard to the children they get more severe forms of measles and scarlet fever at Gunnislake than they would at Mary Tavy, because they are living in an impure air in consequence of the houses being densely crowded.

18,941. Is fever difficult to eradicate?—It is more severe at Beer and Gunnislake in consequence of the overcrowding. Cholera is also more virulent there when they get it.

18,942. Do you know a disease peculiar to miners called "miners' disease?"—Yes; but if you take certain districts it is not very rife; at Mary Tavy it is not, although it is a deep mine; you get more at such a place as Gunnislake and Beer.

18,943. Do you think that the overcrowding of the dwellings also tends to the increase of what is called miners' disease?—Yes, I think so; very much.

18,944. You think that a man is in an unhealthy state owing to his habitation?—Yes, you have that superadded to the other drawbacks upon him; first of all he has irregular hours, then when he gets home he has a miserable place to sleep in; he may be sleeping in the same room as that in which his wife is washing in the same day.

18,945. At what age do you think that this miner's disease generally attacks a man?—At various ages; about 40 I think sometimes; but there is very little of it in Mary Tavy.

18,946. Did you ever have a post mortem examination?—No, we do not get post mortem examinations.

18,947. Do you go down any of the mines?—No, I have never been down.

18,948. (*Mr. Holland.*) About how many years have you been in Tavistock?—About 30.

18,949. You have been in practice for that time?—Yes, rather more than 30 years.

18,950. You said that you thought the disease was

TAVISTOCK.
Mr. R. Sleman.
27 May 1863.

much more influenced by the dwellings than by the employment of the men ?—Yes.

18,951. Has there been much diminution in disease since the town of Tavistock has been improved ; it has been very much improved within 30 years, has it not ?—Yes. The town has been very much improved ; but then I rather doubt whether there has been that improvement in the dwellings, because although the Duke of Bedford has erected very good cottages the other parts of the town have been still overcrowded.

18,952. Has there not been a very great diminution in the overcrowding ?—There has certainly in those cottages, but not generally throughout the town.

18,953. Is there very much overcrowding still ?—A great deal.

18,954. Have you ever been at a mine where the doctor was appointed by the adventurers ?—Yes.

18,955. Which is the best system ?—The system where the men choose the doctor is by far the best ; it is best for the adventurers, it is best for the doctor, and it is best far the men.

18,956. Is there less grumbling ?—There is no grumbling at all.

18,957. The men just change their doctor as they please ?—Yes.

18,958. Is there any canvassing ?—No ; it is quite unnecessary, it is of no good ; if you have not anything like a standing, it is of no use to ask a man to employ you.

18,959. We were told in Cornwall that there was danger in this system, from the doctors and the men acting rather unfairly towards each other, the doctors canvassing for names?—That is all very well in theory. I was with Dr. Harness, under the old system ; he happened to be a nephew of Mr. John Taylor, who has just died, and it broke down under him ; he had other practice which was more remunerative, and he did not care so much about the miners, and then Mr. Taylor determined to throw it open. Wheal Friendship was the first mine in this neighbourhood where it was thrown open ; since that, you never hear anything like a row.

18,960. Does this system, in your opinion, give any unfair opening to a low class of practitioners ?—No, it cannot ; a man must be qualified. I think that as the men pay the money the other is a most unfair plan.

18,961. You think that that objection is merely fanciful ?—Yes. There are one or two mines in this neighbourhood which are not upon this system.

18,962. Do they go on as satisfactorily ?—Not at all.

18,963. I understood you to say that you thought that the miners' disease was much influenced by the dwellings ?—Yes.

18,964. By "miners' disease" you mean the particular bronchitis to which the miners are subject ?—Yes, bronchitis terminating in consumption.

18,965. Are the women of the miners' families here peculiarly liable to bronchitis or consumption ?—No.

18,966. But are they not as much influenced by the dwellings as the men, or more ?—No. The men have irregular hours, and when they come home they very frequently sleep where their wives are washing. Girls are not so ; they work by day, and come home and sleep by night. I draw the inference that the dwellings have a good deal to do with the matter, from the fact that at the deepest mine in our neighbourhood, Wheal Friendship, the miners' disease is not pravalent, and the cottages are not so filled.

18,967. Is there any other peculiarity about that mine ? Is it very well ventilated ?—I think it is just like other mines. I think that the ventilation of the mines in this district, with very few exceptions, has been attended to, because it is the interest of the adventurers to have them well ventilated ; you cannot get a man to work in a badly ventilated mine unless you pay him more.

18,968. Do a large proportion of the men work in the deep levels at Wheal Friendship ?—Yes ; it is essentially a deep mine.

18,969. They work all levels ?—Yes, but chiefly at the deep levels.

18,970. And they are not more unhealthy than other miners who work in shallow mines ?—No, certainly not.

18,971. In fact are they more healthy ?—Yes, I think so, partly owing to that ; and Mary Tavy, where Wheal Friendship mine is, is near Dartmoor, where there is pure air.

18,972. Are they younger or older men than the others ?—They are older, because at Mary Tavy as a rule the men are born and die there ; they do not migrate as a general rule to Gunnislake or Bere. At Bere and Gunnislake the miners have not been born there, but come from other districts, it being a new mining district.

18,973. Wheal Friendship is an old mining district ?—Yes. I have attended about 30 years ; it has been working, I think, about 50 years.

18,974. Has it increased much lately ?—It has rather decreased ; there are not so many men working there now as there used to be.

18,975. Have you seen much of the miners' disease ?—No, except at Gunnislake.

18,976. You have not seen it down the country?—No.

18,977. You cannot compare the prevalence of it here with it in the Cornish districts ?—No, not at all. I believe that it is influenced a little also by the strata. I believe that where the men are working in granite they get it worse than in killas ; it used to be so in old Gunnislake Mine very plentifully ; that was in granite. Perhaps the prevalence of the disease is also influenced by the miners themselves ; there is less intemperance among them.

18,978. Is it a marked disease among the miners ?—Not in Wheal Friendship ; not in Mary Tavy district.

18,979. It is so in Tavistock ?—Yes, and in Gunnislake.

18,980. A very large proportion of the men who are ill have that disease ?—Yes.

18,981. Three fourths ?—No, nothing like that. There is such a proportion as that you would notice it, but it is not so at Mary Tavy.

18,982. What are the chief causes to which you attribute it ?—There are several causes ; one frequent cause is boys going up the deep levels too rapidly, that is a predisposing cause, I think. Then another cause, I should say, is the irregularity of the hours at which the men work, the irregularity of their sleeping hours, sleeping by day and working by night, and I should also mention the dwellings. I believe it is admitted that in mines which are in granite the men suffer more than in killas. I have never heard it accounted for.

18,983. The system of using changing houses for drying their clothes has been introduced in your time, has it not ?—Yes.

18,984. Has it produced a marked improvement in their health ?—I think that that must have been the natural result.

18,985. Do you think that they suffer much from dust ?—No.

18,986. Do they suffer much from smoke ?—No.

18,987. Do they complain much of it ?—They complain of bad air ; but what they call bad air I believe is what they take at the public house ; working in bad air, I believe, has been working at the public house more than anything else.

18,988. (*Mr. Leveson Gower.*) Of the different mines with which you are connected, which, in your opinion, is the worst for miners' disease ?—I should say that the Gunnislake mines are the worst.

18,989. Those are not as deep as Wheal Friendship ?—No.

18,990. As to ventilation, are they worse ventilated than Wheal Friendship ?—The mines about Gunnislake, except Wheal Maria, are not so well ven-

tilated as the other mines ; they are newer mines, and in some instances machinery has not been put up nor shafts put down in sufficient number ; they have been obliged to use air machines.

18,991. Therefore though less deep they are worse ventilated than Wheal Friendship ?—Yes, and worse for the men to work in.

18,992. Do you apprehend that the miners are as long-lived as the agricultural labourers ?—In certain localities they are ; in other localities they are not. It hink that at Mary Tavy they are as long-lived.

18,993. But, taking the average, what is the case ?—If you take the average, you take the Gunnislake and the Beer districts ; they are not so long-lived ; they get fevers from which the others are exempt.

18,994. (*Mr. Davey.*) You said that there was a considerable improvement in the health of the miners since you had been practising ?—I think so.

18,995. To what age do they generally live now ?—I think that at Mary Tavy they live as long as the others.

18,996. And do they continue to work underground ?—Yes.

18,997. We saw yesterday that a greater part of the men underground were young men. What becomes of the old ones ?—You are, most likely, now speaking of the Devon Consols ?

18,998. Yes.—They have been very charitable at the Devon Consols ; when it started they took on a lot of men who were getting past work in other mines, and they have not had much work out of them ; perhaps they have had 10 or 15 years work out of them, and now they put them to do other things. But at Wheal Friendship they have had the men from their childhood perhaps up to 60, and they have one working at 70 at Wheal Friendship.

18,999. Then at Wheal Friendship after a man becomes of a certain age he is taken from underground and put to the surface ?—There are very old men working at Wheal Friendship now who do not like going to the surface. They work as long as they can ; there are many now working at Wheal Friendship between 60 and 70 years of age. Men and boys work together at Wheal Friendship.

19,000. Are you surgeon to the Devon Consols ?—Yes. But you must draw this difference between the Devon Consols and Wheal Friendship, that one is an old mine and the other a young mine. At Wheal Friendship you will find men who have been working there for 50 years.

19,001. Where do the old men go ?—In a place like Wheal Maria, if there are old men who have worked out their strength in the service of the mine, there are plenty of places where they can put them to dry clothes and cut up timber. A number of old men are wanted at Devon Consols, but still I know that they have employed men who were nearly past work in other mines, and then they soon become burthensome to them.

19,002. (*Sir Philip Egerton.*) From your experience in this district, how should you define shortly the symptoms and progress of what you call true miners' disease ; do you say that it commences with bronchitis ?—Yes, generally.

19,003. What are the next steps ?—It is a gradual disease ; it eventually gets into phthisis.

19,004. It becomes true tubercular disease ?—Yes.

19,005. Do you consider that to be the true miners' disease of this district ?—I do not go the length of saying that the miners are subject to that disease, and that their lives are shortened in consequence, because I have evidence to the contrary in Wheal Friendship.

19,006. I gathered from your evidence that you considered that the social habits of the population in some districts complicated this miners' disease ?—Yes.

19,007. Therefore you can scarcely call it the true miners' disease uncomplicated with other disease ?—No.

19,008. For instance, have they the black spit ?—Yes.

19,009. At what period of the disease is that ?—That is before it gets into what we call tubercular phthisis. They may have it, and it may pass off ; men work on for years after having it.

19,010. Are you quite confident that the black spit degenerates into true tubercular disease ?—Frequently it does.

19,011. In other districts we have evidence that phthisis is very rare in cases of miners' disease—that hepatization of the lung is the consequence ; do you find that to be the case in this district ?—No.

19,012. You have spoken of climbing the ladders as being a predisposing cause ; do you believe that it affects the lungs ?—Certainly ; it affects the heart and the lungs.

19,013. It proceeds to affect the heart also ?—Yes.

19,014. Then the miners' disease is complicated with heart disease ?—Yes.

19,015. I think you have stated that you have never had a post-mortem examination ?—No, there is no object to be gained in a post-mortem examination that I know of.

19,016. You could ascertain the state of the lungs by the stethoscope, I suppose ?—Yes ; or even without the stethoscope. I think you are pretty nearly certain what you are treating.

19,017. Have you ever known any cases of true miners' disease terminating in phthisis in districts otherwise healthy, where you have not had the complications of bad dwellings ?—I have had miners' disease in Mary Tavy, but it is rare.

19,018. Terminating in phthisis ?—Yes.

19,019. How do you account for the spurious melanosis, as it is called, that is to say, the black spit ?—I suppose that that is from the bronchial tubes.

19,020. Not from any dust which is inhaled ?—No, not at all.

19,021. From blood extravasated ?—Yes.

19,022. And the colouring matter of the blood causing black spit ?—Yes.

19,023. Not smoke or caroon ?—Not at all.

19,024. (*Mr. Kendall.*) How many medical men are there at Wheal Friendship ?—There are only two. I am not certain whether there may not be another medical man, but two I should say.

19,025. How many medical men are there at the Devon Great Consols ?—I can hardly say now. I think that I attend about 250. I do not trouble myself to ascertain who are attending the men. I am satisfied with the number that I have.

19,026. Have you ever conversed with any of those surgeons who have very few miners ?—No.

19,027. Therefore you do not know what their opinion is as to the present system ; you think it a good one, and the fairest to all parties ?—There is no question about it ; it does not admit of an argument.

19,028. Have you ever discussed the matter with the medical men who have very few miners ?—No ; in some mines I have very few.

19,029. You never heard any complaint of other medical men ?—You cannot have a complaint where the list is fairly kept ; there is no right to complaints.

19,030. With regard to accidents, are there fewer than there used to be ?—I do not know as to whether the number is fewer. I think that they are about the same.

19,031. Do you attend the inquest as a matter of course when there is an inquest ?—No, because that would involve the payment of a guinea. I mean that the coroner would not be justified in calling me.

19,032. If an accident occurs, and you are called to the man as the mine doctor, and he dies, is not it a matter of course that you attend the inquest ?—No ; we never attend unless the cause of death may be uncertain ; for instance, if I am called to a man, and I do not think that it is a case for amputation, and subsequently I consider that it is, and the man dies

Tavistock.

Mr. R. Sleman.

27 May 1863.

after the amputation, the coroner may or may not call me, because it may have been owing to improper medical treatment.

19,033. Do you think that it is on economical grounds that you are not called as a medical man generally?—Yes; I think that the coroner feels bound not to call us, because if the cause of death is apparent I do not see that we are required.

19,034. I will suppose an accident, and that the man lingers under that accident and dies?—Then we are not called as a general rule.

19,035. If you attend him in the meanwhile you are not called on the inquest?—No, not as a rule.

19,036. (*Mr. Holland.*) If a man dies after being hurt it is assumed that he dies in consequence of being hurt?—Yes, generally.

19,037. Without evidence of the fact?—Yes.

19,038. (*Chairman.*) Have you any miners who are working at Drake Wall's mine?—Drake Walls happens to be an exception to what I said just now. I did attend at Drake Wall's mine, but the purser thought proper to strike my name off the list.

19,039. The purser makes out a list of the doctors to whom the men apply?—Generally speaking he keeps a list for his own satisfaction; we seldom see it.

19,040. The men are to a certain extent limited in their choice by the list which the purser makes out?—No, they are generally allowed to choose what doctor they please.

19,041. (*Mr. Leveson Gower.*) Have you ever known a case in which your evidence could have been of use in the investigation in which you were not called on account of the expense?—No, I do not know that. The great object is for the coroner to watch whether there has been any neglect on the part of the mine, and blame attachable to them. I think that that has been the chief thing.

The witness withdrew.

Mr. James Hosking examined.

Mr. J. Hosking.

19,042. (*Chairman.*) Are you underground manager of any mine?—Yes, I am underground agent.

19,043. Of what mine?—Drake Walls.

19,044. Any other mine?—No.

19,045. Is East Gunnislake adjoining?—Yes, East Gunnislake is north of us.

19,046. What description of ore is yours?—Tin.

19,047. How many men have you working underground?—About 120 generally.

19,048. How many boys?—We have not many boys underground; not younger than about 18 or 20.

19,049. How do the men enter the mine and come out?—By ladders.

19,050. What is the greatest depth?—102 fathoms is the bottom of the mine.

19,051. Is that 102 fathoms below the adit level?—Yes.

19,052. Do you work by tut work or tribute?—The whole are on tut work.

19,053. What is the strata?—Killas or clay slate.

19,054. Is it hard or soft?—It is tolerably compact killas.

19,055. Do you blast much?—Yes.

19,056. Do you work by sinking?—Sinking and driving and stopeing.

19,057. Do you work up from a lower level, or do you work down?—Some portion of it we stope in back from the lower level, and some portion we stope under hand from the upper levels, something like quarrying; we call it underhand stopeing.

19,058. Do you use much timber?—Not a great deal, considering the extent of the mine.

19,059. How is the roof supported when you are working?—The sides generally are pretty well; we fill up some portion of it from the refuse.

19,060. You have accidents sometimes?—Very rarely.

19,061. When was the last time you had an accident there?—We have not had one for a good while. I can hardly say when the last was.

19,062. Was not one there last year?—I don't think that we have had any death for two years or moer than that. I think it is between two and three years since we had any death from an accident.

19,063. Do the men excavate the whole of the level below? Do they work by winzes?—We sink shafts first and we stope underhand and sometimes in the back.

19,064. Do you take out the whole?—Yes, with the exception of a few arches, small portions to support the sides here and there; in some places it is generally very firm.

19,065. There are a number of open workings to the surface?—Yes, it is very open. We have one down-cast shaft and two up-cast shafts. These are the degrees of heat, which I took myself.

The Witness handed in the following paper—

1862.	Brentons. lbs.
Candles consumed in the mine and at surface	15,388
Powder consumed	31,000

(*Witness.*) I think that ours is the most open mine in the county, because almost all the ground is beaten away; it is not closely confined as some mines are.

19,066. Are your men young men chiefly or old men?—Middle aged men; some from 19 to 20 up to 50.

19,067. Where do they reside?—Some of them near the mine, and some of them perhaps two or three miles off.

19,068. Is there plenty of house accommodation in the neighbourhood of the mine?—Yes.

19,069. Do the men change much or do they stay by you?—We have some men in the mine who have been there I believe 14 or 15 years, others 7 or 8 years, and others come for a few months and then leave.

19,070. Do they come from other mines in this neighbourhood or from a distance?—Some come from the westward, and some from other mines; some are constantly changing.

19,071. Have you any men who are at all affected in their breathing, who have come to you from other mines?—I do not know that we have now.

19,072. You do not think that men come to seek work there on account of its being a more open mine than others?—Some have done so, I believe; some have left other mines to come there, and they find that they are much hardier after they come there to work. They generally accustom themselves to carry a bit of food with them, and when they are in other mines they have no appetite to eat it, but in our mine

they can eat it and are glad to have it ; they are heartier.

19,073. From the system of working the men are not at all afraid of working there ?—No, I never heard them complain.

19,074. You do not think that there is any danger in the mode of working your mine ?—No ; I have been in the mine between eight and nine years, and we have not more accidents there than in other places, I believe.

19,075. Is there an allowance of candles to the men ?—Six men have 10lbs. of candles in a week ; it is hardly 2 lbs. each.

19,076. What are they charged for the candles ?—8*d.* a pound.

19,077. And for powder ?—8*d.*

19,078. Have you any doctors attached to the mine ?—Yes.

19,079. How are the doctors paid ?—Every man subscribes 15*d.* a month for doctor and club.

19,080. Is the club merely for visible hurt or for sickness ?—For hurt, not for sickness.

19,081. How much does the doctor get out of the 15*d.* ?—9*d.*

19,082. And the rest is for the men in case of injury ?—Yes, in case of an accident.

19,083. Do those doctors attend other mines besides yours ?—Yes ; Dr. Brown from Callington has perhaps about 30 of the men, and there are Dr. Sellers from Gunnislake, and Dr. Northey ; those two gentlemen have the greatest part of them. They live at Gunnislake, about a quarter of mile from the mine.

19,084. Then the men choose either of those two doctors ?—Yes.

19,085. But two are appointed by the adventurers ?—Yes.

19,086. How often are the wages paid ?—Once a month.

19,087. Is a month kept in hand ?—Yes.

19,088. Do you allow subsist ?—They have subsist one month and pay the other. We set a contract for two months generally.

19,089. Have you any women working at the mine ?—Yes, women and girls, a great many.

19,090. Do they work under cover ?—Yes.

19,091. Have they any separate place for getting their meals in ?—Yes, they have a house, if they choose to go in ; but they do not go in there in this this weather, in winter time they do.

19,092. Where do the men change on coming up from the mine ?—In the dry. We have a tube, about five feet in diameter, from the engine house, always warm. The smoke which comes off from our two boilers passes through this tube, and it always causes it to be warm, so that sometimes a man cannot suffer his hand on it. They dry their clothes, and there is a man to attend to that.

19,093. That is where the men change ?—Yes.

19,094. (*Mr. Leveson Gower.*) Have you many boys at work underground ?—No.

19,095. Have you any ?—None less than about 18 or 19.

19,096. Are any of the women whom you employ married women ?—We have two or three widows there, the husbands having been killed in the mine. One was killed in the mine about six or seven years since, and we have the widow.

19,097. But you have no married women ?—No, not with husbands.

19,098. (*Mr. St. Aubyn.*) Are there more accidents in your mine than in others in the neighbourhood ?—No, I do not think that there are.

19,099. Have you found that there are more complaints by the men than usual as to the condition of the mine ?—No, I never heard any of them complain of the condition of the mine, as regards being afraid to work.

19,100. Are the footways and so on in good working condition ?—Yes, ladders with iron staves and wooden sides, with an underlie of perhaps 16 or 18 inches in a fathom.

19,101. Have you had many accidents from the falling away of the country ?—No, I do not know that we have had any accidents from the falling away of the country for years.

19,102. (*Mr. Davey.*) What is the size of the lode in this mine ?—It is branches chiefly, varying from 9 to 15 or 16 feet in breadth.

19,103. What is the character of the ground ?—It is clay slate.

19,104. You are obliged to take the whole of it to the surface ?—Yes.

19,105. You could not select any to remain behind for support ?—We have an arch which we have to support the sides. Perhaps every 10 fathoms there is an arch two or three feet thick.

19,106. Where you find it very soft at the sides, are you obliged to bring down the stuff from the surface again for support ?—It is not very soft, it is all open, but yet stands firm.

19,107. I understood you to say that you were sometimes obliged to bring the stuff down from the surface ?—Yes, because the burrow is so far off, and it is handier for tipping.

19,108. You could not select enough rubbish out of the mineral underground to fill up that space ?—The same space would not hold the same stuff again.

19,109. If you are working underhand or stopeing at the back, cannot you select sufficient refuse from the back of that level to fill up the space again ?—We cannot work in that way ; we cannot work as in a good many mines in Cornwall, taking away the side ; we are obliged to take away the whole of the branches up to the surface ; the branches sometimes are as thick as my finger, and sometimes they are two or three feet apart. We are obliged to take away the whole ; sometimes it is 15 or 16 feet wide, and sometimes wider than that.

19,110. (*Mr. Kendall.*) Does your timber cost very much ?—We have Norway timber chiefly.

19,111. Do you use a good deal of timber ?—We have only one timber man and an assistant in the mine ; it is not a costly mine for timber.

19,112. (*Mr. St. Aubyn.*) Can you state how many men have been killed in the eight or nine years that you have been in the mine from the falling away of the country ?—No, I am not prepared to answer that question, but I think it is three.

19,113. Not more than three ?—Not above three, and one of them was killed by blasting the powder, one was killed by an accident in timbering ; he fell away from the stage, and another fell away through a hole.

19,114. But there has not been a single accident from the ground falling on the men ?—No.

19,115. How many years was the mine worked before you came ?—I believe that the mine has been working this time about 18 or 19 years ; I cannot tell to 12 months.

19,116. Did you ever hear of any man being killed from the falling away of ground on him in the mine before you came there ?—No, I do not recollect that there ever was such a case.

19,117. (*Mr. Kendall.*) You have been on the mine nine years ?—Between eight and nine years.

19,118. And there has been no accident during those eight or nine years from the falling in of the ground ?—No.

19,119. You do not consider the ground dangerous ?—No.

19,120. The men are not afraid to go there on account of danger ?—No ; I never heard one of them say so.

19,121. (*Mr. Davey.*) Did you ever hear of any accident occurring whilst the mine was part open to the surface ?—No, it was before I came there that it was part open to the surface. It is a mine of old standing ; no person can tell the commencement of it, and it used to be worked quite open.

19,122. Were you in the neighbourhood longer than the nine years ; what part of the country did

Tavistock

Mr. J. Hosking.

27 May 1863.

you come from?—I have been in the neighbourhood of Callington a great many years past.

19,123. Are you a Cornish man?—I was born in Callington; I was reared chiefly in Fowey Consols; I worked there for a great many years; I had all my rearing there till I was 21 or 22.

19,124. How long have you known Drake Walls?—I was never well acquainted with the mine before the last 9 or 10 years.

19,125. (*Mr. St. Aubyn.*) If it had been a common thing for men to be killed in Drake Walls nine years before you went there, you would probably have heard of it?—I should, no doubt, have heard of it; it would generally have been cried up as a dangerous mine, if it had been so.

19,126. And, in your opinion, it never has been considered as a dangerous mine?—No.

19,127. (*Mr. Kendall.*) At what depth did you work in the Fowey Consols Mine?—125 fathoms was the deepest level I ever worked in.

19,128. How was the air at the 125 fathoms as compared with the Drake Walls Mine?—Fowey Consols was a very hot mine.

19,129. You consider your mine much healthier than Fowey Consols?—Yes, nothing to be compared to it.

19,130. Did you work in the Fowey Consols as a tributer or as a tut-work man?—As a tut-work man generally. Some of the ends in Fowey Consols were very warm.

The witness withdrew.

Mr. William Gard examined.

Mr. W. Gard.

19,131. (*Chairman.*) Of what mine have you charge?—I am the manager of East Gunnislake and South Bedford and Old Gunnislake.

19,132. What is the description of ore in those mines?—Copper.

19,133. How many men have you working underground?—At present we have about 30 at East Gunnislake; we have only 6 at present at the Old Gunnislake Mine; we have generally about 100, but we have taken off a portion of the men now.

19,134. What is the deepest level at which you are now working?—36 fathoms under adit; about 75 fathoms from the surface.

19,135. The men go down by ladders?—Yes.

19,136. How far is any level driven from any shaft or winze where the men are now working?—We are now driving for the purpose of ventilation; we are in 170 fathoms from the engine shaft.

19,137. How is ventilation provided there in the meantime?—Artificially, by pneumatic pump.

19,138. How is the pump driven?—It is worked from the main rod of the engine.

19,139. It is not water ventilation?—No, it is air forced in.

19,140. Has that answered completely in the meantime?—It serves for the purpose of the number of men that we have now in the end; but we have a large quantity of ore laid open, and we have tried to take it away; we first tried artificial ventilation by driving a 46 fathom level and sinking a winze inside, and then driving a second level hoping that we should so get a current of air; that the smoke would come away from the end and come back to the part of the mine where there is a winze up again to another level, and so away off the shaft; but it failed, inasmuch as the current was backward and not the way we wished. We have tried every way to get a current of air, by doors and one thing and another, but have failed, and consequently we abandoned taking away the ore until the present shaft which we are now sinking and this level are communicated.

19,141. You did not try the application of fire?—No, it would be impossible to do so. We have about nine fathoms more to drive to reach the shaft; the shaft is not down yet; 20 fathoms sinking of the shaft will bring it down to the 36.

19,142. And in the meantime you must depend solely upon the air which is driven in?—Upon the air driven in by this machine.

19,143. How long is the smoke now getting away from where the men are working?—It goes away freely; there is very good air indeed there now.

19,144. Do the candles burn freely?—Yes.

19,145. How is the air taken in?—By 4-inch zinc pipes a part of the way and 6-inch zinc pipes.

19,146. The machine is constantly at work being attached to the engine?—Yes; the same power keeps the water as well as the air.

19,147. You think that that sized pipe would not admit of more men working than there are?—No, certainly not; it would be against our own interest to put on more men.

19,148. How have you ascertained that?—We ascertained it practically by the amount of work.

19,149. Have you taken any means to ascertain the number of men who can work with the power of the air machine which you now have on?—We have an end to drive, and the ore to be taken away is behind that narrow ventilation; the consequence would be that if the men behind were making a great quantity of powder smoke, you never could bring your air pipe close into the end for fear of its being broken by blasting. I dare say there is quite enough for 12 or more men there.

19,150. How many corps do they work?—Three of eight hours each.

19,151. Do they work for the whole 24 hours?—Yes, they work day and night, and they relieve in place; they mostly relieve at the sumpt house where they change. We make them relieve in place because it ensures regularity. If a man is not down to the time his colleagues grumble. The men keep a check on each other.

19,152. You think that that is the best way?—Undoubtedly, because the men who have been down eight hours, if the next pair of men are not down at the proper time, take care that it shall be reported.

19,153. Would that answer if the mine was deeper?—Decidedly.

19,154. Then the men would work longer hours?—It would come nearly to the same thing, because if the men were underground eight hours the others would come down and relieve them at the time.

19,155. Whose business is it to remove the deads? Is it in the contract?—No; all the hauling and tramming is done separately.

19,156. Is yours water power entirely?—Yes.

19,157. What amount of candles are the men allowed?—We allow them about 2 lbs. a week each man.

19,158. What is the price charged for them?—We charge the men 8*d.*

19,159. And for powder how much?—6*d.*; but practically the adventurer pays for all that.

19,160. What do the candles cost you?—About 5½*d.* to 6*d.*, and very often they cost us 6½*d.*

19,161. Is there any difference in the management of either of your mines?—Not at all.

19,162. How are the doctors appointed?—I appoint the doctor.

19,163. The men have not a choice in the doctor?—No; I have never in any mine, where I have had the management, allowed them to choose the doctor.

19,164. What is the deduction for the doctor?—9*d.*; we charge 1*s.* 6*d.* We do not allow any sick pay, for this reason, that very often in a mine old men come in whose constitutions are broken before they come there; they get laid up, and there is so much taken away from the fund which would otherwise go towards the man who is hurt, and who then requires everything that you can give him, therefore we prefer accumulating a large fund for a man who is hurt; and they all of them have their own sick clubs. I take it that if we allowed sick pay, in fair-

ness to the men, we ought to have every man medically examined before coming into the mine; a young man would have to pay to the support of an old man. If you have a given number of men there must be a given sum subscribed.

19,165. They have sick clubs among themselves?—Invariably. As a general rule I think that there is no miner but who pays to a club besides his mine club. I think that at all events 75 per cent. pay to clubs besides their mine clubs.

19,166. The men have never objected to the doctor?—No.

19,167. How often do you pay the wages?—Once a month.

19,168. And do you keep a month in hand?—Yes.

19,169. Do you allow subsist?—Yes, occasionally.

19,170. Do you pay in notes?—I pay in gold and silver always.

19,171. Do many oldish men come to work?—Yes, we have several men who have been in our mine for eight or nine years.

19,172. Have you any men who are affected in their breathing?—We had one who died very recently, and died almost suddenly; he had been complaining of an uneasiness on his chest, and he reported himself sick, and the next day he died; he burst a blood vessel, and he was dead in about five minutes.

19,173. Are there any men working there now whom you know to be affected in their breathing?—None that I know of.

19,174. (*Mr. Holland.*) How long had that man whom you have mentioned been ill?—We did not know that he had been ill, nor I believe did he know himself; his comrades said that he had been complaining for about a week before.

19,175. Did he find the climbing very hard?—No. From my own experience I do not think that the climbing, if you take sufficient time at it, is any more than rowing a boat.

19,176. How much air does the engine send in?—I can hardly tell; the air pump is about 2 feet square and 6 feet stroke.

19,177. How many strokes are there in a minute?—About $3\frac{1}{2}$.

19,178. For how many men?—For six men.

19,179. That is about 112 feet a minute?—Yes. It is quite sufficient.

19,180. Does it pay the adventurers well to supply it?—Of course; we could no work at all without it.

19,181. Does the extra work which you get from the men pay for the engine very well?—Undoubtedly: it will at all times pay to ventilate a mine well; it does not matter to what expense you go, provided you have a paying mine. I consider that good ventilation is the best outlaid money that you can possibly have in a mine.

19,182. There is no doubt about it?—There is no doubt in the world about it. The system in all mines throughout Devonshire and Cornwall is this: you set an end, we will say, that is worth 10*l.* a fathom to drive; you give the men a price which will give them the average rate of wages of the district; our men will earn about 3*l.* 5*s.* a month, and the captain uses his judgment, so that the men will get about that sum. Every mine captain will set so that the men shall get that, whether there is good air or not; if a mine is badly ventilated he finds by and by that the men instead of driving two fathoms drive one, and he still pays for that one the same price as for two.

19,183. (*Mr. Kendall.*) As you are such an advocate for ventilation, I will ask you why you drove 170 fathoms before you sank a shaft in order to communicate and have ventilation?—Our engine shaft is upon the boundary of two sets, and before I had the management of the mine they had been working entirely westward; they had got down to about 70 fathoms, and had driven about 150 fathoms, and had driven 16, 24, 36, 49, 60, and 72 fathom levels, and it had always been a coaxing mine,—too much ore to abandon it, and not enough to pay. When I took the management we were in granite. I saw that the dip of the granite was very near the engine shaft, and I thought that by driving an exploring level into the clay slate from there I should very likely find a deposit of ore. We were just at the very junction. I saw that it was very quartzose ground and not likely to be productive, and I thought that if we could get from that into the clay slate, very likely we might obtain ore. Therefore we drove an exploring level, one single level, and we very soon cut ore. As soon as we had done that we went away to a considerable distance and commenced the engine shaft for the very purpose of ventilating it, and we are sinking that shaft for the purpose of ventilation.

19,184. (*Mr. Holland.*) Why did you put that engine and shaft there?—The engine shaft was for working westward; we have two shafts westward which give perfect ventilation, but when we changed the direction of the mine altogether, and began to work in unexplored ground, we drove a single level, an exploring level, and that into a rising hill; it was necessary to go off a fair distance to sink this shaft to make it pay; we are now paying 20*l.* a fathom for sinking that shaft.

19,185. (*Mr. Leveson Gower.*) Do the men complain about the ventilation?—They did, when we had so many men in there.

19,186. Do you rely upon the captains for knowing when the ventilation is bad, or upon the men?—We depend upon ourselves. I go underground myself as often as I think necessary; about once a week or once a fortnight.

19,187. Have you had any accidents lately?—None, except one man who went in to see whether the fuse had taken fire, and it very satisfactorily showed that it had, for he arrived there just as the hole went off, and hurt his hand; that was all. I think the mercy was that he had not been blown to the winds. We have had no fatal accident there for seven or eight years. We had a man who had his legs crushed in the water wheel, but we have had no fatal accident underground. In fact, we have but one man on hurt pay, and that is the unfortunate man who lost his leg in the water wheel.

19,188. (*Mr. St. Aubyn.*) What was the temperature at the end at the 170 fathoms?—64°, I think when a gentleman took it the other day.

19,189. You were driving an exploring level?—Yes.

19,190. And you did not sink a shaft from the surface until after you had cut the ore?—No; we were then in about 60 fathoms, and there we had plenty of air; the moment we cut ore we commenced sinking a shaft.

19,191. Supposing that you had not cut ore, then how far should you have considered yourself justified in going, without additional ventilation, before you sank a shaft?—We should have had artificial ventilation the moment we thought that we required it, if the air became hot or impure.

19,192. Before sinking a shaft for the purpose of natural ventilation, how much longer should you have gone on?—We have been sending in artificial ventilation now for a considerable time; I think, ever since we got to the 80 or 90 fathoms.

19,193. How far would you have driven your exploring level before sinking a shaft to make natural ventilation?—I can hardly answer the question; it would depend entirely upon the nature of the ground; upon whether I thought that the ground was likely to prove productive. I should judge entirely from the nature of the stratum. It is quite possible that we should have abandoned it altogether; if we had driven into the clay slate, and had found from its nature that it was not likely to be productive, we should not have followed it; we drove through the granite and found it wholly unproductive, but the moment we passed through that into the clay slate, we found the ore.

19,194. (*Mr. Davey.*) What is the distance between the two shafts?—Nearly 170 fathoms.

TAVISTOCK.

Mr. W. Gard.

27 May 1863.

19,195. Do you consider it economical to drive on such a great distance?—Yes, decidedly.

19,196. Would you not have got ore much sooner if you had taken 150 or 100 fathoms between the shafts?—No. There are cross courses between the two, which would have rendered it impolitic to have sunk a shaft at a nearer spot than that. The moment that this communication is through, we can make ventilation to every level throughout the mine, to whatever depth we go, in reason.

19,197. Your going such a great distance is a special case?—It is. We are about in the course of the summer to begin another shaft; we shall go with it about 100 fathoms.

19,198. But you would be able to work the intermediate ground between the two shafts much easier, would you not?—We have about 70 fathoms of barren ground. Under no circumstances should we have sunk a shaft nearer than 100 fathoms.

19,199. What is the depth of the adit at the shaft?—We have two adits; it is 39 fathoms to the deep adit.

19,200. So that your bottom level down to the 36 fathoms would be only 75 fathoms to sink?—Yes, from the surface.

19,201. Having that short distance to sink, do you not consider that it would have been more economical to have had the shafts nearer each other?—No, decidedly not, in any case.

19,202. (*Sir Philip Egerton.*) Where do you get your ore out, by the adit level?—No, through the 36 fathom level, and up the main engine shaft.

19,203. How do the men get to their work? By which shaft?—Down the main engine shaft.

19,204. Have they sollers?—Yes.

19,205. Have you a dry?—Yes.

19,206. Do the men live in the immediate neighbourhood?—All in the immediate neighbourhood, with the exception of one who lives at Tavistock.

19,207. They live within a mile?—Within five minutes walk.

19,208. Do they find it worth their while to change in the dry before going so short a distance?—Invariably; they leave their working clothes there.

19,209. Is the mine a wet mine?—No; we have a 9-inch pump, working $3\frac{1}{2}$ strokes in a minute. It is by no means wet.

19,210. Are the hands whom you employ principally married men?—Principally, I should say.

19,211. Have they cottages?—They have cottages in the village.

19,212. Freehold or leasehold?—They mostly rent them by the week or the month.

19,213. Do they take lodgers?—Yes, unfortunately there is too much of that.

19,214. They are too much crowded?—They are very much overcrowded, and the sanitary condition of the village is very bad. I believe that there is nothing which tends so much to the deterioration of the miners' health as the state in which all these little dirty villages are.

19,215. What is the name of the medical man who attends?—There are two, Mr. Sleman and Mr. Wood; they are partners.

19,216. Are the families of children large in your neighbourhood or not?—I should say large, generally.

19,217. What provisions have you for education? Are there any National Schools?—There are a Church school and a Wesleyan school, but the Wesleyan school is only a Sunday school, taught by girls who are as ignorant as their scholars, as a general rule.

19,218. Do the owners of the mine do anything in assisting in the education of the children?—No.

19,219. (*Mr. Kendall.*) As I understand the 170 fathoms at the 36 was driven on the course of the lode?—Yes.

19,220. And then you were off the engine shaft about 60 fathoms before you found any ore?—About 60 or 70 fathoms.

19,221. How long did that ore continue?—It has continued more or less up to the present time.

19,222. What will it average per fathom?—About 3 tons.

19,223. What is the maximum?—Six.

19,224. When you found that there were 6 tons of ore did you find the air worse than when the ore was poorer?—No, I do not find any difference in working, whether there is more or less ore. We never had the ore continue yielding 6 tons for any length of time. From $2\frac{1}{2}$ to 4 tons would be the quantity.

19,225. How long before there is ventilation shall you go on?—We shall make a communication in November, and we shall raise no ore there until the communication is made.

19,226. For a while you have eight men working in the end?—We have twenty, besides the six men in the end; we have twenty-six men in all.

19,227. How many had you driving the end?—Never more than six, two at each relief. Some have eight, but then they work six hours; that is very exceptional. We have never tried eight, but have thought of doing so.

19,228. In addition to driving on this end you tried to stope?—Yes, we tried it for two months but ceased that, as we found that we could not do so.

19,229. (*Chairman.*) You have stated that the condition of some of these mining villages is very injurious to health?—Deplorably so.

19,230. Has the Sanitary Act ever been put in force?—Yes. I was chairman of the committee for two years, and took a great deal of interest in trying to have it carried out, but was beaten by the owners of cottages; they found that I was making them drain. In the committee which was working there, of which I was chairman, I had farmers for my team; they were very difficult to drive at first, but at last I got them to work the Act, and when the owners found that they were compelled to drain and remove pigsties, and put up water-closets, those who owned these miners' cottages immediately set to work and we were all turned out together. There were two medical men, Dr. Sellors was one, and Mr. Wood the other. We were all sacked at once, and a set of men were put in purposely not to carry the Act out. The law has lately been altered, so that if the Act is not carried out by a committee it is put in the hands of the guardians, which is only going from bad to worse, and making it very certain that it shall not be carried out, because the guardians, beyond the parish, have no interest at all in your parish, and those who are within your parish, if they wished to carry it out, would carry it out under the Nuisances Removal Act by a committee; but they have done nothing of the sort; they have obstinately prevented it. I wrote to the Board of Health, and they sent a medical officer down there. He went about and said that it was very horrible, and that he had never seen anything worse in all the inspections which he had made. I said, "Is there no remedy?" He said, "It would not do to "let all the world know it, but we cannot enforce it "if the Nuisance Removal Committee do not choose "to act, and if the householders choose to combine."

19,231. (*Mr. Holland.*) Why do you not indict yourselves?—I do not know who is to go to the expense. We have 8,000 inhabitants in our parish; the bulk of them are labouring men. Those who own cottages have a direct interest in giving the least amount of accommodation.

19,232. Can you suggest any remedy?—My remedy is that the General Board of Health should be empowered to carry out the Nuisance Removal Act.

The witness withdrew.

Mr. Alexander Henry Wylie examined.

Tavistock.

Mr. A. H. Wylie.

27 May 1863.

19,233. (*Chairman.*) You reside in Edinburgh?—I do.

19,234. At my request you went down to Cornwall to inquire into the circumstances connected with certain accidents which had taken place?—I did.

19,235. Including the Botallack mine?—Yes.

19,236. During your stay there another accident occurred?—Yes, that was in the neighbourhood of Camborne.

19,237. You were present at the inquest?—I attended the inquest.

19,238. Will you name the mine?—The mine was called the Buller and Basset United, about four miles from Camborne.

19,239. You made some inquiries concerning it?—I did.

19,240. Have you a list of the accidents which occurred, to which I drew your attention before you went?—I have a list of the accidents, including the one at the Buller and Basset United Mine. (*The witness delivered in the same, which is as follows:*)

(*See Table in next column.*)

(*Witness.*) My attention was given to the above summary of accidents. The first six occurred before I arrived in Cornwall, and my attention was directed to them by your Lordship, and my knowledge of the circumstances connected with them is derived from an attentive perusal of various reports of Mr. Twite respecting them, and the short-hand writer's notes of the proceedings of the various inquests. No. 7 occurred when I was in the immediate locality, and having personally attended the inquests, and having visited the mine, I am enabled to speak more directly to this special case; but my remarks on this and the previous cases will be contained in a report which the Chairman has specially desired me to hand in to the Commission, and which I will present with various reports, proceedings at inquests, &c. &c. The substance of these remarks I will now allude to informally with the intention of presenting them more fully in a few days.

No.	Date.	Mine.	Name.	Cause.
1	March 4	Dolcoath - -	Thomas Kessel-	Falling down the shaft 13 fathoms to avoid a fall of earth.
2	„ 24	West Fowey Consols -	James Sampson	Explosion while tamping.
3	April 15	Trevenen -	Thomas Wedlake	Falling away of ground.
4	„ 18	Tolvadden -	Charles Vincent	Falling through a trap door.
5	„ 21	S. Just United -	Emanuel Trembath	Falling through a trap door.
6	„ 21	Botallack -	Nine individuals	Breaking of the skip chain.
7	May 13	Buller and Basset United	Frederick Uren George Teague	Blowing out of boiler.

The witness withdrew.

[*Questions Nos.* 19,241 *to* 19,256 *omitted.*]

Adjourned to To-morrow at Ashburton.

ASHBURTON.

Thursday, 28th May 1863.

The Right Honourable Lord Kinnaird, K.T.
Sir Phillip Grey Egerton, Bart., M.P.
The Honourable E. F. Leveson Gower, M.P.
Nicholas Kendall Esq., M.P.
P. H. Holland, Esq.,

The Right Honourable Lord KINNAIRD, K.T., in the Chair.

Mr. William Hosking examined.

Ashburton.

Mr. W. Hosking.

28 May 1863.

19,257. (*Chairman.*) Of what mine have you charge?—West Beam.

19,258. How many men are employed there?—About 160 are employed underground and on the surface.

19,259. About how many underground?—I should think about 110.

19,260. Is it copper or tin?—It is copper and tin both, but principally tin. What we are returning now is tin. There are copper lodes in the set, in the property.

19,261. What is the deepest level at which you are working?—The deepest level from the surface, from the engine shaft, is about 90 fathoms.

19,262. What is it from the adit?—78.

19,263. How many levels are there working?—We are working at present seven levels.

19,264. How many shafts are there?—A great many shafts. We have seven or eight shafts altogether.

19,265. Are any of these shafts upcast and others downcast in the draught?—Some are up and some are down. You will find the draught playing up in some of the shafts and in some down.

19,266. Are they constantly upcast or do they change according to the weather?—They change sometimes. It depends upon the way of the wind.

19,267. How do the men go down and up?—By ladders.

19,268. Are the footways in the drawing shaft or are they separate?—The principal footways are in the drawing shaft.

19,269. Are they bratticed off?—Yes, we have put in a new footway all the way from the surface to the bottom in one shaft very recently. We have new timbered the shaft all the way from the surface and we have got in a new footway all the way.

19,270. Have the ladders 12 inch or 10 inch staves?—Principally 10-inch staves; they are much easier for climbing than 12-inch.

19,271. How many shifts work in the 24 hours?—Three.

19,272. What quantity of candles are the men allowed?—Each man is allowed 2 lbs. a week.

19,273. What is the charge for candles?—8*d.* per lb.

19,274. How much for powder?—The same.

19,275. What is the cost price of candles?—It costs me about 7*d.* We pay a higher price for our materials here than they do in Cornwall. For timber and iron and everything, it costs us 25 per cent. more to work our mines than in Cornwall; the prices are different. The land carriage beats us here.

19,276. How far are you from a railway?—West Beam is about eight miles from a railway, and the road is rough.

19,277. Is the stuff carted?—Yes, the mines further back in the granite towards the moor are nine or ten miles from a railway.

19,278. Are the men young or old men chiefly?—The majority of them are what we should term middle-aged men. The men, roughly speaking, I should think, would average something like 25 or 26.

ASHBURTON.

Mr. W. Hosking.

28 May 1863.

19,279. Have you many boys?—No, not a great many underground.

19,280. Are the women employed at the surface?—Yes, what we term framing the tin.

19,281. Do they work under cover?—Yes, all under cover.

19,282. Is there a changing house for the men when they come up?—No, they change in the boiler-house principally.

19,283. Have you had any accidents on the mine lately?—No.

19,284. Have you had any from blasting?—No, never one.

19,285. Do you use the safety fuse?—Yes.

19,286. Have you any particular kind of tamping rod?—The usual iron rod.

19,287. What tamping do you use?—The men select the safety fuse which they think best for the tamping; they select it underground from the different kinds of stone; we never have an accident from tamping, not from any blasting whatever. We generally give the best price for the best material of fuse, we find that answer best; we generally try to get the best material, so that the men shall have less accidents.

19,288. (*Mr. Holland.*) Do you ever use copper tamping rods?—No.

19,289. You think that an iron tamping rod is quite safe, with proper tamping?—We prove it so.

19,290. You say that the men are of middle age?—Taking the average of the men, I should say that they would average about 25 or 26; I should say so, but I don't speak positively upon the point; we have no old men in our mine.

19,291. Your men are much younger than workmen generally?—Much younger than the men in a great many mines in Cornwall.

19,292. They are a great deal younger than the men in other employments?—I do not know that, I cannot say as to that.

19,293. At what age do you consider a miner to be an old miner?—They vary a great deal in that respect, I see some old miners eighty years of age.

19,294. At what age should you consider a man to be an old miner?—At 70.

19,295. Is not a man of 50 an old miner?—No, I am 50 years of age, and I have worked in a great deal of poor air and powder smoke in my days, and I think that I could go underground now to my labour as well as any.

19,296. Of course, your miners are much like other miners; are they decidedly less healthy, than above-ground labourers?—They are very unhealthy men. You must bear in mind, that our mines are generally shallow compared with those in Cornwall.

19,297. Have you any close ends?—No, it is a well ventilated mine.

19,298. Have you any place where the candle will not burn well?—No.

19,299. What is the depth?—The deepest part of our mine is about 90 fathoms from the surface.

19,300. And many of the men work at a less depth than that, of course?—Yes, a great many; there are not many men working at the bottom of the mine.

19,301. (*Mr. Leveson Gower.*) I understand you to say that you have no boys working underground?—Not very many.

19,302. What is the youngest age?—I cannot say exactly; I should think that the youngest is something like 16 or 17, what we call a boy; there are but three or four, I believe, that we call young lads, and I should think that the youngest of them is something like 16.

19,303. If a miner wished to take his son who was much younger than that, would you object?—No, not at all, if it was a well ventilated place.

19,304. But they do not wish to take them younger?—They would not wish to take their sons into foul air; they do not wish to take them very young; if they did we should not allow it. The boys go first on the surface to work, generally on the floors washing the tin, and when they come to be about 14 or 15 their fathers feel inclined to take them underground, and of course we don't object to that, because it is then time that young lads of that age should go underground.

19,305. You say that you have not suffered from working in a mine?—No.

19,306. In what mines have you worked?—In some 35 in my day, I suppose.

19,307. Were they all well ventilated?—No, some were very bad indeed.

19,308. And yet you did not suffer?—There is no doubt that it did not do me any good; but I am 50 years of age now, and I enjoy very good health.

19,309. How long have you been a captain?—I have been a manager of a mine now for the last 14 years, and I went to a mine to work first when I was 11 years of age.

19,310. Is there any medical man attached to your mine?—There is.

19,311. What is his name?—Mr. Bean.

19,312. How is he remunerated?—By the men subscribing so much per man per month.

19,313. Is that for sickness as well as accident?—Yes; every man who works in the mine pays 1*s.* a month, and then the medical man attends them in sickness and accident, and also their families, their wives and their children, for that money.

19,314. If they wish to see any other medical man, have they the option?—Yes, they have.

19,315. Do they make use of that option?—No, I do not know that they do. They are very well satisfied with the medical man that we have. He is considered a very skilful man, and attends to the men very well.

19,316. Does the fund only go to the one medical man?—The fund only goes to the one medical man.

19,317. If they went to another man, they would have to pay him?—Some of them may live five miles out, and if they wish to have a medical man close at hand, they can have him, and he is paid by the fund as well as the others.

19,318. (*Mr. Kendall.*) You are about 50, and you began mining at 11?—Yes.

19,319. Out of the 40 years that you have been engaged in mining, you have been agent how many years?—14.

19,320. At what time did you begin to go underground?—I went underground at 13.

19,321. What depth mine did you ever work in in bad air?—In Tresavean, in hot weather, where the men worked almost naked.

19,322. What depth was it?—I think I worked at the 270 fathoms.

19,323. Where the large course of ore was?—Yes; I worked there in Captain John Martin's time. It was before the man-engine was put in. I was not there when the engine was erected.

19,324. How long did it take you coming up?—I cannot say now. I forget.

19,325. Were you very much exhausted when you came up?—Yes; and very much exhausted when we came out of the levels to take the ladder.

19,326. It was so very hot?—Yes. I have seen the candles in the clay turn down double from the heat of the ground.

19,327. Did you suffer in health then?—Of course I did not have such good health as I have now.

19,328. Have you enjoyed better health as an agent than you did as a miner?—I enjoyed very good health then, but I do not know that I was quite as well as I am now. I am in fresher air now. I am always in good air, and there is not so much powder smoke.

19,329. As I understand, the principal part of your work now is in the workings resumed by you, which were abandoned some time ago?—There was a party working this property previously to our Company taking it.

19,330. Was there any intervening time between your taking it and their giving it up?—No: the engine never ceased working.

19,331. What was the condition of the ventilation when you took the mine?—It was not bad; the levels and some of the shafts were in a very bad state of repair, but there was a communication from one to the other.

19,332. There was a good draught and good ventilation?—A capital ventilation.

19,333. How long has this been a mining district?—That I cannot tell you; for ages past.

19,334. Do the miners dwell in cottages of their own or in lodgings?—Some of them rent cottages and some of them lodge just the same as in other districts.

19,335. Do those who rent cottages let out to lodgers a great deal?—No, very few.

19,336. Did you ever have occasion to visit the dwellings of the miners here at all?—If a man has a fever, or is dangerously ill, or anything of that sort, we generally go to see him.

19,337. Then you are able to judge of the size of the rooms in which they sleep?—They have plenty of rooms here.

19,338. You have been in Cornwall a good deal; there, I suppose, you may have seen them rather thick?—They are rather cramped up in Cornwall compared with what they are here. Miners are not so plentiful here as in Cornwall.

19,339. What is their average pay?—Tutwork men will average about 3*l.* 10*s.* a month.

19,340. What do the women get?—One shilling a day.

19,341. Do your miners here live as well as the agriculturists or not?—They live better.

19,342. On the whole they live well?—Yes.

19,343. Taking them as a body are they a careful body of men?—Yes; taking them as a body we have a very good staff of men indeed in our mine.

19,344. Do you work principally on tribute or on stopes?—Principally on tribute.

19,345. (*Chairman.*) You say that you do not allow boys to go down when the air is bad; are there any places where at times the air is bad?—Not in our mines.

19,346. Not where you are driving?—No. We have, say, two levels, one over the other, with ten fathoms between; after we have extended the level so many fathoms, if there are any symptoms of the place being close, we put up a rise or sink a winze to ventilate those two levels.

19,347. Till that is put in is the air never close?—No; we don't allow it to go that distance to become foul.

19,348. You have been near Penzance and near Helston?—Yes.

19,349. Have you been farther east in Cornwall than that?—Yes; I worked in Tresavean mine; that is about Redruth.

19,350. Have you been anywhere near St. Anstell? I worked, at one time, a little while in Charlestown United Mines.

19,351. You have been in all parts of Cornwall?—I have been about a good bit.

19,352. Have you been in any other parts of Devon than this?—Yes, on the Moor in Dartmoor; I worked at the Birch Tor mine six years.

19,353. Then you have been in the exposed part of Devon and in the sheltered part of Devon?—Yes; the Birch Tor mine was the worst mine I ever worked in in my life.

19,354. What from?—From cold damp and poor air.

19,355. What do you call cold damp?—That is a damp arising from the rock. It settles in the level.

19,356. Can you breathe in that cold damp?—Of course.

19,357. Will a light burn in that cold damp?—Where it is very bad it will not.

19,358. When you have been in that cold damp, have you ever been down close to the rock?—Yes.

19,359. Could you breathe then?—Yes. I worked in that mine about twenty-seven years ago; it was a very rich mine when I worked there, and they had but one shaft, and in the summer time the air was very bad. I have seen the time when we could not carry in a light below the six fathoms from the surface in some parts of the season, and I being in an end I have seen my comrade in that end working, and I have gone back and have sat down, and I could see the shadow of the man but not the man; that was caused by the cold damp; and if a man put some tobacco in his pipe and took the candle to smoke, directly he took away the candle from the tobacco he could not draw any more smoke, the pipe would go out.

19,360. Is that mine at work now?—Yes. I do not wish to speak of Birch Tor mine now for I do not know anything about it.

19,361. (*Mr. Kendall.*) Have they two shafts there now?—I believe so. I have never been down the mine since I left it in those days.

19,362. Seeing that you have had much experience in various parts of Cornwall and in various parts of Devon, in the high lands and in the low lands, have you in all those districts observed any marked difference between the health of the agriculturists and the health of the miners?—The health of the miners about Ashburton, I should say, is equally as good as that of the agriculturists.

19,363. At Birch Tor, where there was that bad air, do you recollect how the miners were?—It killed scores of miners.

19,364. Take the Tresavean, and all those deep mines and the shallower mines in some parts of Cornwall; was there, in your opinion, a marked difference there between the agriculturists and the miners?—Yes, I should say so, owing to the miners climbing the ladders, the mines being so very deep.

19,365. From your experience, what do you think, is the most injurious part of the miner's occupation; is it climbing, is it smoke, or is it chill when they come up?—Climbing deep and bad air; a man has n business to be chill when he comes up, he should take it leisurely and change directly.

19,366. But they do not do that?—But that is their own fault. I think that climbing very deep is very injurious to the constitution.

19,367. (*Sir Philip Egerton.*) How are the children of the miners educated in your district; have you any national school?—We have a great many free schools. I do not think that there is a better place in the county.

19,368. Are they connected with the Wesleyans or with the Church of England?—Some with the Wesleyans and some with the Church of England.

19,369. How are the schools supported?—By people giving at their decease the rents of estates for the benefit of free schools. Ashburton is a capital place for that.

19,370. And the miners take advantage of it?—Yes.

19,371. At what age do the children begin upon your works?—It varies.

19,372. At about what age?—I should say about nine or ten.

19,373. How many hours do these children of nine or ten work?—They go to work at seven in the morning and leave work at five, and they stop for one hour in the middle of the day for dinner.

19,374. After they come upon your works those children have not much time for education, I presume?—No.

19,375. Do they attend evening schools?—Some of them do; they work in our mine the same as in all mines in the two counties.

19,376. Do you find that the children in your mines can read and write?—They all of them can read, but they cannot all write.

19,377. Do you find that the miners themselves are pretty well educated?—Some of them are pretty well educated, and some are rather plain; you could

Ashburton.

Mr. W. Hosking.

28 May 1863.

not prevail on some of them to learn to write if you were to do whatever you possibly could do.

19,378. Your mine is not worked on Sunday ?—No.

19,379. What distance are your miners from a place of worship, generally speaking ?—The principal part of them live in Ashburton.

19,380. Do they attend service either at church or at chapel ?—The principal part of them at chapel.

19,381. But they attend ?—Yes, very well indeed; they are a very steady lot of men, very good men.

19,382. (*Mr. Kendall.*) Are they Wesleyans ?—They are principally Wesleyans.

19,383. There are two sets of Wesleyans.—Yes.

19,384. Are they the old sect or the new ?—The old sect are here and what are called the Independents.

19, 385. Of which are there the most?—The Wesleyans, I think.

19,386. (*Chairman.*) What proportion, do you think, cannot sign their name, out of the number which you have ?—I do not know; there are some who cannot.

19,387. (*Mr. Holland.*) You said that miners suffered from climbing and from bad air ?—In very deep mines.

19,388. What other causes do they suffer from ?—I do not know. I should think that a medical man would be able to state that.

19,389. What do they complain of much besides that ?—When men have been working in very deep mines for many years and in very foul air, you will see them go away in consumption.

The witness withdrew.

Mr. John Sparham examined.

Mr. J. Sparham.

19,390. (*Chairman.*) Are you the medical officer to the union ?—I am the medical officer to the district.

19,391. How long have you been in this district ?—About 18 months.

19,392. Are you attached to any mine ?—The Devon New Consols. That is closed temporarily.

19,393. Have you miners employed at other mines who come to you ?—Constantly.

19,394. Do they pay for themselves, or are they paid for from the club of the mine ?—Some pay for themselves, and some from the club of the mine, and some fall on the parish. I get them in three ways.

19,395. Have you any men affected differently from other labourers ?—Yes ; there are different forms of disease with them.

19,396. Have you ever been down a mine ?—No.

19,397. Have you ever had a post mortem examination ?—No, fortunately not, since I have been here.

19,398. How should you say that the miner was affected ?—I think from a want of proper ventilation of the mine the miner's lungs become affected.

19,399. In what way does that show itself ?—Generally in the form of pneumonia.

19,400. Have you had an opportunity of seeing them in different stages ?—Yes.

19,401. In the early stage, how does a man suffer ?—He complains of a tight pain in the chest, and a slight cough, and it runs through his form : a rusty expectoration sets in, which in a few days changes to white, and they recover in two or three weeks.

19,402. Have they a cold ?—They complain of cold, but I am aware that it is pneumonia.

19,403. Can you at once tell ?—I at once treat them for it.

19,404. Do you see any difference on account of the particular mine in which they have been working ?—I think that from the Druid, as we call it, that is to say, the Devon New Consols, I get more than from any other on account of the depth ; it is an immense depth, and there is only one shaft to it. I get more men with pneumonia from that mine than from any of the others.

19,405. Should you say that it was increased from the want of ventilation, or from the climbing ?—That I cannot say. I have not had sufficient experience to say, but I have had more of it from that mine than from anywhere else.

19,406. When you find a man affected in that way do you advise him to give up work ?—Directly.

19,407. Have you known cases where they could resume their work with impunity afterwards ?—I have hardly been here long enough to answer that question.

19,408. Do they generally give up ?—They give up directly I order them.

19,409. Had you ever seen similar cases of men affected by working in mines before you came here ?—No. The coal pits do not produce that sort of thing.

19,410. What is the eldest man that you have had as a patient affected in this way ?—A man about 50. The men generally run about 25 to 30 here, I should think.

19,411. Have you any men now under treatment ?—Not at this moment.

19,412. Do you keep any record of cases ?—No ; I have no time for that.

19,413. Have you had any cases of accident since you have been here ?—A good many.

19,414. From what ?—Principally from falls, either men falling in the shafts, or pieces of rock falling upon them ; most of them have been scalp accidents.

19,415. Have you had fatal ones ?—No.

19,416. In what mines especially should you say that those accidents have occurred. Have they taken place in any one in particular ?—Not in any one in particular. When I first came here I had to attend them nearly all; one medical man, and the other being out of the way, I attended for the other medical men.

19,417. Do you know how many men are working in the Devon New Consols ?—When they were at work, about 40 or 50 men.

19,418. Why is it stopped ?—From some pecuniary reasons, I believe. I do not know precisely.

19,419. How long has it been stopped working ?—Not above a month or six weeks at most. I have had men on all the time ; there are some on now. Of course, the shaftman and some others are on now.

19,420. Are there any men now whom we could see who have been treated ?—No, not that I am aware of. They are all dispersed.

19,421. But before the mine was stopped, you had men ?—Yes, constantly coming to me with slight pneumonia and bronchitic attacks, which I attributed to their being in the foul air more than anything else. They complained that after they had been in this foul air for some time, they had a pain in the chest, and this went on for some days, and then they came to me with pneumonia evidently. How far the ladders might conduce to that by their having to climb up 600 or 700 feet, I cannot say.

19,422. How did they describe the first feeling of the symptoms ?—An oppression in the chest.

19,423. Was the head affected at all ?—Not much. They did not complain so much of that.

19,424. What is the food of the miners ?—I think they live pretty well.

19,424*a*. Do they get much butcher's meat ?—Yes, plenty of butcher's meat. They are rather a dissolute set here ; we get an inferior class of men, *i.e.* of the Cornish miners.

19,425. (*Mr. Holland.*) Is this disease very slow in its progress ?—No ; it is about two or three days before it gets to its climax, when treated at the commencement of the attack.

19,426. What is the end of it ?—The end of it is that resolution sets in, and they have a little rusty expectoration, and they get about again.

19,427. Do they have it again ?—Yes ; I have had one or two with a return of it.

19,428. Are they very liable to relapse?—That I can hardly say. I have not been here long enough to say. I have had one or two relapses. It seems to me that deficient ventilation is the cause which does so much mischief to the men.

19,429. (*Sir Philip Egerton.*) What opinion have you formed of the general health of the district, exclusive of the miners themselves ; of the families of the miners, for instance ?—My opinion is that we are excessively subject to disease of the lungs here ; that is to say, the general population, men, women, and children.

19,430. Is there a good deal of consumption ?—A great deal of consumption ; in fact, I have seen more consumption in the 18 months that I have been here than I saw for 12 years in Staffordshire. I was halfway between Wolverhampton and Stafford, north of Wolverhampton.

19,431. Is there much low fever?—I have seen none.

19,432. Are you inclined to attribute the prevalence of consumption and lung diseases to the air of the district, or to the overcrowding of the habitations ?—I think it is to be ascribed to the air of the district—the constant changes of temperature that we are subject to.

19,433. From the visits that you have made to the cottages of the miners, does it strike you that they are overcrowded ?—They are overcrowded in this town ; very much so.

19,434. But how is it in the country districts round about ?—In the country districts they are much about as they usually are.

19,435. Do you find much difference in the hygiene of the town and of the country districts ?—They are more unhealthy in the town.

The witness withdrew.

Mr. Joseph Phillips Nicholls examined.

19,436. (*Chairman.*) Of what mine have you the charge ?—Frank Mills and South Exmouth mines.

19,437. What is the character of the ore ?—Both the mines are lead mines.

19,438. About what number of men are employed underground at South Exmouth ?—About 70 in all.

19,439. And how many at Frank Mills ?—From 70 to 80.

19,440. Do those men work night corps ?—In some of the most important places, but not in all.

19,441. Are the men mostly tributers or tut-work men ?—There are tributers and tut-work men in one mine, but no tributers in the other. Frank Mills occupies 22 tributers, and the rest are tut-work men ; at South Exmouth there are no tributers.

19,442. Why are there no tributers there ?—Because it is a new mine, only just started.

19,443. Frank Mills is the older mine of the two ?—Yes ; and is opened to a greater extent.

19,444. What is the deepest level at Frank Mills ?—One hundred fathoms.

19,445. What number of levels are you working at present ?—40, 60, 70, 84, and 100 fathoms.

19,446. How many shafts are there ?—Three.

19,447. What is the greatest distance from any shaft or winze that you are now working ?—About 28 fathoms.

19,448. What are you driving ; are you driving on the lode ?—We are driving on the lode and cross-cuts. Our general drivings are on the lode.

19,449. How far can you drive on the level away from a shaft or winze ?—That would depend entirely on the nature of the lode ; if the lode is small and poor we can drive to a considerable distance, and the air will continue good, but in some places where the lode is large and rich we can scarcely go any distance without conveying air by some means either by pipes or otherwise ; where the lode is small and poor, you can, comparatively speaking, go as far as you like.

19,450. Is it a rich lode where you are now driving ?—The lode is rich within a few fathoms of the end, but not in the end, that is in the sixty fathom level.

19,451. In these three shafts is there one upcast, and are the others downcast ?—There is one upcast, and there are two downcast.

19,452. Is it always upcast ?—It has been so the last two or three years, and it is also against the laws of nature ; the lowest shaft is the upcast; it is a thing seldom seen.

19,453. That does not shift with the weather ?—It has not shifted in the last five years; just when it was first completed it shifted a few times, but it has since taken a regular draught and continued so.

19,454. Do you adopt doors or any other means ?—Yes, in some cases we adopt doors.

19,455. You take measures in order to continue the upcast ?—Yes, to continue it right to the end of the mine.

19,456. What artificial means do you use when the air gets bad ?—Sometimes doors and pipes, or a machine to blow air.

19,457. What sort of a machine ?—A fan machine, worked by hand.

19,458. Have you any water blast ?—Occasionally where there is a chance we throw a waterfall.

19,459. Have you any means of doing that ?—We have sometimes, we do not want it at present. We can do it in the bottom levels, but not in the upper, there being no water.

19,460. Is there no place at present where the air requires a fan ?—The worst place that I know of is in the 60 fathom North, and that is not bad.

19,461. (*Mr. Kendall.*) How far is the 60 fatho North off last winze ?—About 28 fathoms.

19,462. (*Chairman.*) Are you going to communicate with another level there ?—Directly, without going any further ; we are searching for the same part of the lode, in the 70 fathoms, to rise and sink and form a communication. We are not in the same part of the lode ; if we were, we should drain the water ; we only want to drain the water, and put a winze through.

19,463. In this place do the men work three corps ?—They do so in some important places ; we work as few by night as possible ; there are none working by night in that particular place.

19,464. How long is the end free from any men ?—From ten at night till six in the morning.

19,465. Do you find the air worst at night, or in the morning ?—It is worst at night, it freshens while the men are absent.

19,466. Have you any cold damp or carbonic acid gas in that mine ?—There is carbonic acid gas which comes out of the lode, but there is no cold damp.

19,467. What quantity of candles are the men allowed in Franks Mill's mine ?—2 lbs. each.

19,468. Is there much blasting ?—Very little.

19,469. Is it chiefly worked by the pick ?—Chiefly by the pick.

19,470. Is there much dust ?—No. The ground is chiefly damp, not wet, but a little damp.

19,471. Have you a pumping engine there ?—Yes.

19,472. A steam pumping engine ?—Yes.

19,473. Do the men ascend by ladders ?—Yes.

19,474. Is there any place for them to change when they come to the surface ?—Yes ; a very convenient dry.

19,475. Near the footways ?—Yes.

19,476. Are the footways in the drawing shaft ?—The principal part of the men come through the engine shaft and drawing shaft, but they are divided.

ASHBURTON.
Mr.
J. P. Nicholls.
28 May 1863.

19,477. They are bratticed off?—Yes. There are three shafts, and in case of accident they could come through any one.

19,478. The South Exmouth mine has not been working so long as the other?—It has been working two years.

19,479. Was it an old working before that?—There was very little done; the shaft was sunk about 16 fathoms.

19,480. How long have you been manager of either of those two mines?—Of the South Exmouth from the commencement, and of Frank Mill's from six months after it commenced; I have been between nine and ten years at Frank Mill's.

19,481. What is the greatest depth at South Exmouth?—The 60 fathom level.

19,482. What is the adit?—There is no adit in the district, the depths are given from the surface.

19,483. Are there more shafts than one?—There are three shafts.

19,484. How is the air generally?—The air is very good in general, but our shafts there do not work so regularly as in the other mine.

19,485. You have not a regular upcast and downcast?—No; the shafts stand nearly in a level, hence in a sudden change of wind they stop the wind current. We have raised one shaft 30 feet, and that has made the ventilation better.

19,486. Has that made it an upcast?—Generally, but not for certain. We have plenty of air. We have three shafts in the mine, and it is only open to a certain extent. Sometimes there is so much air that you can hardly carry a candle.

19,487. What length of workings is there?—The greatest extent of South Exmouth is 170 fathoms; the entire length.

19,488. Are the three shafts along the level?—No, the one air shaft is just against the engine shaft, against the cross cut.

19,489. Do they communicate with that long level?—They all communicate.

19,490. How far are you now working from any winze or shaft?— Not more than, I should say, 25 fathoms at the furthest place.

19,491. Have the men there ever complained of the air at the end?—Never.

19,492. Have you ever found that the candles would not burn there?—Yes, occasionally, and then of course the men must not stay there; they leave, if the air is even so bad that the candle will not burn; the men have no business there any longer.

19,493. Then do you put them to other work?—Yes, if it continues for any time; of course we should not keep the men idle. I have seen places where the lode has been large and rich, that you would merely strike into a cavity and you must leave directly, but in six hours there is as good air there as is here; if you let the gas escape the air will clear itself again directly and mix with the other.

19,494. Does it extinguish the light at once in in that case?—Yes, if you put it near it.

19,495. (*Mr. Kendall.*) It will not flame?—No.

19,495*a*. But it puts out the light?—Yes.

19,496. (*Chairman.*) Do you think that the men have ever suffered from working too long in it?—I do not know that they have. There is one class of our men that do not stand long, that is the men brought up to agricultural labour until they come perhaps to years of maturity; those men are the men who fall off quickly; but we have some men who have worked from boys who are very old; one was buried a few weeks since who worked in the mine till he was 75. There is another working on the mine, strong and healthy, 76. There is another regular miner in the neighbourhood, past 80, not working in our mine, but a regular miner.

19,497. Have you any boys?—Yes; some of the fathers are bringing their boys up.

19,498. Do those boys suffer at all?—They do not appear to suffer in any way.

19,499. Are the greatest number of the men working there young men?—We have some of all ages.

19,500. Have you women working on the surface?—Yes.

19,501. Do they work under cover?—All the women are under cover.

19,502. Have you a doctor attached to your mine?—We have a regular doctor.

19,503. Do the men pay club money and doctor?—Yes, the miners; but the surface men do not pay club, but only doctor.

19,504. How much do the men pay?—9*d*. a month for doctor and 9*d*. for club. The boys and girls pay 3*d*.

19,505. Is the club money for visible hurt, or sickness?—For visible hurt. A great many of the men are in the parish clubs, and if they are sick and receiving pay from both clubs they get more than if they are working. We are continually giving; in any case which we think deserving we help them.

19,506. Is there a separate account kept of the club money?—Yes. We give them gratuities; at the last pay day we paid £6 to the men that were sick; but they cannot claim it. The boys and girls have nothing to do with the club; the 3*d*. is for the doctor. The doctor attends them for everything and also the underground men.

19,507. By whom is the doctor appointed?—By the purser, and the men have a voice in it. When the present doctor was appointed it was left to the men whether they would like him or not. There has never been a complaint against him.

19,508. If the men were to go to another doctor, could the money be applied to him?—No. If they entered any just complaint against the doctor, he would be changed.

19,509. Have you a boiler?—We have two boilers at Frank Mills, and one at South Exmouth.

19,510. Are those boilers provided with any index?—One is, the others are not.

19,511. In the others, is it ascertained merely by the cocks?—By the cocks and the safety-valve.

19,512. Is there more than one safety-valve?—There is one to each boiler, and either one would apply to the other boiler, because they are connected.

19,513. (*Mr. Leveson Gower.*) Have you ever had any fatal accidents in your mine?—Yes; but not many. We have had fatal accidents in Frank Mills, but not in South Exmouth.

19,514. How many have you had?—Four.

19,515. Since when?—That is in all the working, I suppose, within the last nine years. Our accidents are very scarce.

19,516. When was the last?—In the beginning of January or the latter end of December.

19,517. What was the cause of that accident?—A scale of ground.

19,518. Did you work yourself in a mine when you were young?—Yes, from a boy of 12 years old.

19,519. Till when?—I have not worked much the last 20 years. I worked in Cornish mines until I was 24, and then I went to Mexico, and stayed there nine years. Since that I have been in Devonshire managing mines the greater part of the time.

19,520. Was your health at all affected from having worked in mines?—Never. I believe that up to February I enjoyed as good health as any person living; since then I have had congestion of the lungs. I caught a cold, and had congestion of the lungs.

19,521. (*Mr. Kendall.*) Did you catch cold underground?—No; I got wet above ground.

19,522. Wholly unconnected with mining?—Yes. My health is as good as any person's.

19,523. Have you worked in the deep mines in Cornwall at all?—Yes.

19,524. In what mines?—In the Great Consols; I have worked as deep as the 240 fathoms.

19,525. Did you go down by a man-engine or by ladder?—A ladder.

19,526. How long did it take you to go down?—About 20 minutes to go down.

19,527. And how long to come up?—Three quarters of an hour to an hour.

19,528. You had no man-engine in those days?—No.

19,529. How many hours used you to work underground clear?—It was called eight hours, but then we made the up and down in the eight hours.

19,530. You did not relieve in place?—Not except at the latter end of the month, or anything of that sort.

19,531. How long did you work in that deep level?—About six months; then I afterwards worked upon tribute for two or three years.

19,532. At the end of the six months did you find your health fail or not?—Not a bit.

19,533. What age are you now?—Forty-eight the 23d of next July.

19,534. Up to the time of your having this cold you were as strong as ever?—As strong as ever I was in my life, and I am now fast recovering.

19,535. Have you experienced the effects both of carbonic acid gas and of cold damp?—I have.

19,536. What is the difference between the two in the feeling?—In cold damp you would begin to get sleepy directly, and feel your legs to tremble, but the carbonic acid will put out your candle; the cold damp would have an effect upon you as quickly as it would put out the candle, or rather sooner; but in the other, before you feel the effects of it your light is gone, and hence you retire.

19,537. (*Mr. Holland.*) Does the light go out at the bottom of the level?—The air is very good there.

19,538. (*Mr. Kendall.*) Can you see cold damp?—You would see it as a mist before your eyes, and your candle would be blue.

19,539. (*Mr. Holland.*) Is it a peculiar-looking mist?—Yes; and you feel a curious sensation too as soon as you get into cold damp.

19,540. (*Chairman.*) Does the ground require much timbering at South Exmouth?—Yes, we use a good deal of timber in some places.

The witness withdrew.

Adjourned.

NATHANIEL JOHN HAYDON, M.D. and L.R.C.P., examined.

19,541. (*Chairman.*) Are you the medical attendant at any mines?—Yes; I have two mines under my medical superintendence. Yarner Mine in Bovey Tracey, and Atlas Mine in Ilsington.

19,542. How many men are employed at each of these mines?—Between 40 and 50 at each of them.

19,543. How long has the Yarner Mine been worked?—Between 6 and 7 years.

19,544. What is the ore raised from it?—Copper.

19,545. What is the deepest level?—40 fathoms; they are now sinking on the 50.

19,546. Is the mine a wet mine?—It was formerly a very wet mine, the water coming in on the men from the upper part of the workings; this arose from the nature of the ground. It is now very much improved; a steam pumping engine has been lately put up.

19,547. Did the men suffer at that time?—Yes, they were very sickly.

19,548. Are they improved in health?—Yes; but they are still sickly.

19,549. What do they principally suffer from?—Pectoral disease, such as bronchitis, inflammation of the lungs, and rheumatism.

19,550. What, in your opinion, is the principal cause of this?—The want of a good changing-house and proper "dry," so that the men have often to change while their clothes are still wet.

19,551. Do the men not change in the boiler house?—No; they are allowed to dry their clothes there, but not to change.

19,552. Why?—Because the captain considers it dangerous; the steam engine does not work regularly, but only at certain parts of the year when water power is scarce.

19,553. Have you many men at one time under your care?—Yes; particularly in wet weather. I have had as many as six or seven out of the 45 at work there.

19,554. From what disease?—From colds and from the diseases I before mentioned.

19,555. Do the men complain?—Yes, they complain of the want of a good "dry" and "change." Most of them have to walk from Bovey to the mine, just 2 miles, over an exposed road; they frequently get wet through; they then go underground for 8 hours, come up fatigued and freely perspiring, and have to put on their wet and cold clothes.

19,556. This, then, would be likely to induce sickness?—Certainly; for a man exhausted by 8 hours' work underground would be more liable to feel the ill effect of cold and wet than a man not exhausted; he would, therefore, be so much the more liable to "catch cold."

19,557. How is the mine ventilated?—I have never been below, but I produce a section of the mine. There are three shafts; the old engine shaft, a new air shaft, and the new engine shaft is now being sunk; there are numerous "winzes," and the captain and the men quite agree that the mine is well ventilated.

19,558. How many men did you say there were at Atlas Mine?—From 40 to 50.

19,559. What description of ore is raised there?—Tin.

19,560. Is the mine well ventilated?—I have never been below, but I produce a section of the mine. She is said to be very well ventilated.

19,561. Are the men healthy?—Yes very healthy.

19,562. What do you attribute this to?—To a good changing house and "dry" near the shaft.

19,563. How long have you had the medical superintendence of these mines?—About four years.

19,564. Have you ever had opportunities of investigating the diseases of miners except in those mines?—Yes. I formerly resided for four years in Cornwall, where I had frequent and continual opportunities of seeing and studying the diseases of miners; and some years since I had the medical care of a mine (lead mine) in Hennock.

19,565. Have you known any cases of miners' asthma?—Yes; I have seen many who have suffered from it; I have one case under my care at present.

19,566. How does it begin?—With slight difficulty of breathing and cough, depending on bronchial irritation; the amount of difficulty of breathing and cough necessarily differs in different individuals; in some cases the cough is nearly always present, dry and harsh.

19,567. (*Mr. Holland.*) How does it proceed; and what are the sounds on percussion and auscultation?—The circulation becomes affected, and you have increased frequency of pulse with more or less palpitation of the heart; a very harassing cough. You have a loud respiratory sound, but a dulness on percussion; this after a time is followed by a state of extreme exhaustion; the sufferer appears to waste away; his pulse becomes much slower; and in this state of sinking, or almost living death, he may and often does go on for several years.

19,568. Is there any black spit?—Yes; black spit is a frequent symptom of the second stage of the disease; it is called by some authorities carbonaceous bronchitis or black phthisis.

19,569. Have you formed any opinion how black spit is produced?—I imagine it to be a carbonaceous deposit from the blood, produced in the lung, mainly

Ashburton.

28 May 1863.

dependent on a long continued breathing of bad air in imperfectly ventilated mines.

19,570. Is it your opinion that a free and perfect ventilation of mines is necessary to prevent miners asthma and black spit?—I believe a free ventilation of the mines, conjoined with a good "change" and "dry," are the essentials for preserving the health of miners.

19,571. Is black spit never produced by other causes than by bad air?—I have seen black spit in a gentleman now a patient of mine, who was never in a mine in his life. He suffered for some time from a troublesome bronchitis, and for the last two years has shown "black spit." It has been examined microscopically by some eminent London men; and we came to a perfect conclusion, that in this case he had a carbonaceous deposit, and not a malignant disease. I do not know what produced it. It is a very common thing to find black matter in the lungs and bronchial glands.

19,572. Are you aware that some high authorities consider "black spit" to be a melanotic deposit?—I know there are a variety of opinions in this matter. The peculiar characteristic is the black matter. Messieurs Foy and Thenard from their analysis affirm it to be a highly carbonized insoluble matter, supposed to be altered colouring matter of the blood. Dr. Fyfe is of the same opinion. Dr. Cassell calls the black appearances spurious melanosis. Professor C. J. B. Williams says the production of black matter may coexist with various modifications of the nutritive process, * * * * as in the peculiar combination of black with opaque caseous matter, not unfrequently found in the lungs and bronchial glands; but, agreeing with Andral, he hesitates to class simple melanosis with malignant growth. I have not seen Professor Virchow's work; but I am informed he considers the deposit to be melanosis, and that Professor Goodsir coincides in that view. But without doubt two of the best papers on this subject are to be found in the Edinburgh Monthly Journal of Medical Science, 1846, by Dr. Makellar; and in the Edinburgh Medical and Surgical Journal, 13 vol., by Mr. Graham. It is here shown to depend essentially on the smoke from the lamps suspended from the miner's head while at work; to the inhalation in confined mines both of the carbonic acid generated in the pit, and of that expired by the labourers themselves; and also the inspiration of heated air after the explosion of gunpowder required in the works in which float carbon and carburetted gases.

The "black spit," which is after all one of the most serious complications of disease to which miners are liable, inasmuch as it is a symptom of a grave, intractable, and incurable pulmonary affection, has been long known. Haller relates it, so does Bayle and Laennec (Herbert's edition. 1846, p. 355, 71), under the name of Melanosis; but M. Andral, in his notes to Laennec (op. cit. p. 822, 23), very distinctly combats this view, especially in the case of miners, and he relates instances of miners who had been killed by violence, and who through life had exhibited no signs of pulmonary disease, had on post mortem examination been found with extensive black deposit in the lungs.

In Copeland's Dictionary of Medicine, vol. 2, p. 787, this disease is well treated of under the title of Spurious Melanosis.

In the Cyclopædia of Practical Medicine, vol. 3, pp. 97, 98, 99, 100, there is a most valuable paper from the pen of Dr. Carswell, "Spurious Melanosis," *from the introduction of carbonaceous matter.* He relates the cases of two miners: The first of whom was a patient in the Royal Infirmary, Eding, and died there; he relates the P.M. appearances, and the analysis made by Professor Christison of the black matter. 1. Concentrated nitric acid boiled on it did not alter the colour. 2. Immersion in a strong solution of chlorine had no effect. 3. A strong solution of caustic potass boiled on it took up some animal matter and filtrated very slowly. 4. He subjected a small portion of the black powder left after the action of the boiling nitric acid, well washed and dried, and introduced into a glass tube with a ball to the action of a low red heat a considerable quantity of gas which had the odour of coal gas, and on the approach of a light took fire and burnt with a dense white flame. In the tube a dark yellow fluid likewise condensed, which had exactly the odour of impure coal tar naphtha, and became a soft mass on cooling of the consistence of lard. This, when compressed between layers of filtering paper, yielded an oily stain to the paper, and left a white matter, which dissolved in boiling alcohol, but appeared again on cooling in the form of minute obscure crystals. Dr. Christison remarks on this, "It is scarcely possible not to recognise the ordinary products of the distillation of coal;" and Dr. Carswell said, "The result of this analysis does not permit a doubt as to the origin and nature of the black discoloration in the case;" but Dr. Carswell suggests that while there can be no doubt that these black masses are due to the inhalation of carbonaceous matter, "*is it not more probable that the accumulation is determined by a morbid state of the lungs themselves?*"

It is impossible not to be struck with this question of Dr. Carswell. The almost habitual breathing of bad air necessitates the fact that the blood is never properly decarbonized, from a want of a proper or sufficient quantity of oxygen; carbon can only combine with a given proportion of oxygen; carbonic acid is carbon in combination with the largest proportion of oxygen which it is capable of combining with. But the action of oxygen does not simply stop when it has combined to form this carbonic acid; another proportion of oxygen is required to cause the removal of the carbonic acid itself. In a deep mine or badly ventilated mine you not only have not sufficient supply of oxygen for these purposes of healthy life, but you are continually consuming oxygen by the lights which are necessary, and so continually adding to the quantity of carbon and carbonic acid; the lung is in a state of almost habitual congestion, and soon acquires that morbid state suggested by Dr. Carswell. It is well known to practical miners that "tribute men" who work in what is comparatively good air are freer from disease and longer lived than "tutt men" who work in bad air. A very excellent paper on the influence of respiration on the blood is to be found in "Stevens on the blood," pp. 1 to 162.

19,573. What practical conclusion would you deduce from these facts?—That no mine can be worked with a proper regard to the health of the miner that is not most freely ventilated; that in all mines, in addition to air shafts, there ought in all cases to be a series of winzes sunk, not as now for the purpose of profit to the mine, but for the purpose of ventilation, and so of health and life to the men.

19,574. Have you had any cases of miners with tubercular phthisis under your care?—Yes, and I found it aggravated by working at the mines; one man in particular was a labourer who took to mining after he was 30 years old, and he soon knocked up. I have seen many agricultural labourers take to mine work, but they cannot stand it long without illness.

19,575. As a rule do you consider that tubercle is produced by that condition described as miners' asthma?—On the contrary, while miners' asthma is frequent, tubercle is a rare disease amongst miners; it certainly may co-exist with the asthma, but is not produced by it. There is too a curious but very important distinction, for in the advanced stages of the asthma you get a very slow pulse, in tubercular phthisis you get a very fast one.

19,576. Have you made any post mortem examinations?—No.

19,577. How have you formed your opinions of miners' disease?—From a careful watching of numerous cases during the last 23 years, and by noticing the physical signs of disease, and by comparing my own experience with the best authorities who have written on the subject.

19,578. Have you seen any other form of disease amongst miners?—Yes. Many years since, in 1845, I

attended a man, Wm. Wilmot, working at a lead mine near Hennock, who was completely paralysed in his lower extremities from lead palsy.

19,579. Do you think he drank the water?—No, I do not. I made particular inquiry at the time, and I found he had been standing in the water of the mine. He was 26 years old.

19,580. Are the lead mines less healthy than the copper and tin mines?—I cannot say.

19,581. Have there been any accidents at the Yarner or Atlas Mines?—Very few and very trifling ones at Yarner; a man indeed fell down the shaft, but was scarcely injured. At Atlas there have been several bad accidents, including compound fractures of the legs, fractured skulls with depression, dislocation of shoulder, and some lesser casualties.

Ashburton.

N. J. Haydon, M.D., L.R.C.P.

28 May 1863.

19,582. Have you noticed any particular disease amongst the families of miners?—No; they generally live in the same way and are subject to the same influences as the agricultural labourers' families and are liable to the same classes of disease.

LONDON.

Wednesday, 17th June 1863.

Present:

The Right Hon. Lord Kinnaird, K.T.	John St. Aubyn, Esq., M.P.
Sir P. Grey Egerton, Bart., M.P.	Richard Davey, Esq., M.P.
The Honourable E. F. Leveson Gower, M.P.	Edward Headlam Greenhow, Esq., M.D.
Nicholas Kendall, Esq., M.P.	P. H. Holland, Esq.

The Right Honourable Lord KINNAIRD, K.T., in the Chair.

Robert Angus Smith, Esq., Ph.D., F.R.S., examined.

London.

R. A. Smith, Esq., Ph. D., F.R.S.

17 June 1863.

19,583. (*Chairman.*) You reside at Manchester?—Yes.

19,584. You are a professional chemist?—Yes.

19,585. And a Fellow of the Royal Society?—Yes.

19,586. You have made, I believe, the examination of air your special study?—I have.

19,587. I believe that at my request you visited Cornwall?—I did.

19,588. And you went underground in different mines?—I did.

19,589. Did you when underground make any experiments as to the state of the air?—I made some experiments upon the air with permanganate of potash, and ascertained that great impurities were to be found in the air. This examination on the spot, however, was only intended to enable me to understand the usual conditions of a mine, and to give me an idea of the nature of the investigation which I was about to undertake.

19,590. Did you take with you underground any peculiar means of bottling the air?—I brought away a number of specimens of air—I collected the specimens in this manner. I took tubes of this shape (*producing a tube*). These were filled with air—that is to say, air was drawn through them, and when they were completely filled with the atmosphere of the place they were sealed by means of a blow pipe, and were retained in that state until they were wanted for analysis. I used a bellows-pump to draw out the air. I have not brought it with me. When the tube was sealed it was in this condition (*producing another tube*).

19,591. (*Mr. Holland.*) It was sealed at the moment?—Yes, on the spot.

19,592. (*Chairman.*) You also had a good many tubes sent to you?—Somewhere above 200—perhaps about 250 have been sent to me.

19,593. These tubes have been sent since September?—Yes.

19,594. Do you know the levels or the mines where the air in those tubes was taken?—In very few cases indeed; in fact I may say in no case whatever, except in those which I took myself.

19,595. The tubes are all numbered, are they not?—They are.

19,596. After you had got the tubes at your laboratory will you describe the process which you adopted in order to ascertain the quality of the air which was contained in the tubes?—I thought it most important to ascertain first the exact amount of oxygen and carbonic acid, to see how far the air was deteriorated from the want of oxygen. In order that I may be more concise in my language I may, perhaps, be allowed to read what I have written, simply as a very short abridgment of my investigation, because it would require almost a volume of itself if I gave it fully, as it has been extended over many months. I did not confine my examination of the air to one method, but I considered it needful first of all to obtain an exact knowledge of the composition of the specimens, as far as oxygen was concerned, and along with it carbonic acid and nitrogen. As this can be given in figures obtained by very exact methods, all vague expressions and all uncertainty of opinion are removed. We may not be certain that air is wholesome, even when it contains the normal amount of oxygen, according to analysis, but we are quite certain that it is unwholesome when it does not contain that amount, the removal being made by breathing or combustion, and the products remaining. To obtain the amount of oxygen I used hydrogen, and exploded the two gases. I consider this the cleanest method. The number of specimens hitherto examined for oxygen and carbonic acid amounts to 120; there are, however, many others on hand for analysis, and some of the specimens have been examined for organic matter and other substances. Pure atmospheric air contains 21 per cent. of oxygen, or at least from 20·9 to 21. There are different opinions upon that subject, but 20.9 may be taken as the lowest. Any amount equal to or above 20·9 I shall call normal. Any amount below proves the air to be inferior. When the amount is as low as 20·6 the atmosphere is certainly very bad in the sense in which we find air to be bad in crowded rooms, still supposing the products of oxidation to remain. Air containing oxygen to an amount varying from 20·6 to 20·9 must therefore be called impure air. It is air in which no one can thrive, and into which if we suddenly come we feel great discomfort, whilst to some persons it is not tolerable even for a few minutes. Air having less than 20·6 of oxygen may be called extremely dangerous, such as we seldom are called on to breathe, and such as occurs only in exceptional cases, as in mines, and in similarly close spaces. Allowing these three kinds of air to exist, of good, bad, and extremely dangerous, the 120 specimens divide themselves thus: 25 specimens or 20·8 per cent. are normal; 30 specimens, or 25 per cent. are decidedly impure; and 65 specimens, or 54 per cent., belong to the extremely dangerous class. There are varieties in each of these three, but especially in the very impure and dangerous, for example, some speci-

London.

R. A. Smith, Esq., Ph. D., F.R.S.

17 June 1863.

mens have an amount of oxygen nearly as low as 18 per cent., so that about 12 or more per cent. is removed; now, as even a candle goes out when 24 per cent. is removed, and in some conditions such as in the absence of currents, even in less impure air, we can readily understand that we have arrived at a very deleterious atmosphere. I have not, however, obtained such extreme results as those which have been obtained by Mr. Moyle. Some of the specimens which I obtained contained little more than 18 per cent. of oxygen. Mr. Moyle, who examined the air of the Cornwall mines some years ago, found as little as 14 per cent. I am told, however, that many of those specimens which I have now in my possession for analysis are very inferior to those which I have already examined, and it may happen that I shall find Mr. Moyle's results corroborated. However, as the specimens appear, they have not sunk so low as Mr. Moyle's. I may say that in my experiments I found that at 16 per cent. an ordinary tallow candle was extinguished, and became perfectly black; at 14 per cent. paraffin oil burnt; and I think at 12 per cent. alcohol went out. More volatile oils of course burn longer.

19,597. (*Mr. Holland.*) Do you mean a paraffin oil lamp with a glass?—Yes, but in this case the chimney evidently assisted the combustion by causing a draught. What I have stated relates to the amount of oxygen. I have the details in these note-books, which are rather voluminous, and I did not expect to give them to day. The carbonic acid may be taken as the difference between the amount of oxygen actually contained in the gas and 21 per cent.

19,598. (*Dr. Greenhow.*) That is to say, that where there is only 18 per cent. of oxygen there will be 3 per cent. of carbonic acid?—Yes.

19,599. Do you find that this relation is always preserved, namely, that the increase of carbonic acid is exactly equal to the deficiency of oxygen?—I find it a little different. I believe that the relation would be exact if the carbonic acid were caused by breathing, or by the combustion of a candle; but as sometimes the carbonic acid is introduced by explosions and external methods, the relation is not exactly preserved.

19,600. (*Mr. Holland.*) The combustion may not be perfect; there may be carbonic oxide, and therefore there would not be an exact correspondence?—That would also be the case. Besides the carbonic acid there are other substances. I will first give the substances which are actually introduced into the atmosphere by the explosion of gunpowder and by combustion. These are carbonic oxide, hydrogen, and sulphuretted hydrogen; these three as gases. Then there are sulphate of potash, carbonate of potash, hyposulphite of potash, sulphide of potassium, sulpho-cyanide of potassium, nitrate of potash, carbon, sulphur, carbonate of ammonia, sulphide of ammonium, organic matter, sand, and in some cases a little arsenious acid. These are introduced into the air.

19,601. (*Dr. Greenhow.*) Which of these arise from the combustion of gunpowder; arsenious acid, for instance, will arise from a different source?—Yes; arsenious acid arises chiefly, as far as I know, from striking the arsenious ores; there is a strong smell of arsenic a moment after striking; some of the ores give it out in very decided quantities, and some of them give it only in very small quantities, but there is a very large amount in some of the ores.

19,602. Will you specify exactly which of the salts end gases you have named are given off in consequence of the combustion of gunpowder, distinguishing them from those given off in the working of the mine?—All of those last specified, with the exception of organic matters, sand, and arsenious acid, come from combustion. We know that these gases exist in the mines, and that these solid substances which I have spoken of occur along with them, because they are given out by the operations which take place in the mines.

A very important question relates to the amount of solid substances. This amount is great enough to render these materials visible even when there are only a few inches depth of air containing them. They issue from the mines with the appearance of dust and smoke. An important part, as I consider, of my investigation relates to the capture of the minute particles of which this smoke is composed, and their retention in a permanent as well as in a visible condition. All, or nearly all, the 150 tubes have been examined through the microscope, and in most cases I have marked down the relative amount of crystals formed in the tube. I thought it right to pay more attention to the crystalline forms than to the shapeless dust, as it is more interesting as well as more capable of proving the origin of both. I have obtained very correct drawings of the crystals in about 20 of these tubes, which show considerable variations in the forms; although sulphate and nitrate of potash are the principal crystals, sulphate of potash greatly predominating. Much of this begins as sulphide of potassium, and must act in a manner similar to sulphuretted hydrogen, if not more violently, at least I suppose so; it is, however, soon converted into sulphate of potash. I will show some of these substances.

(*The witness produced the same.*)

19,603. (*Chairman.*) I suppose that these are magnified?—Yes.

19,604. (*Mr. Holland.*) About how much?—About 60 diameters.

19,605. (*Chairman.*) Are you able to ascertain from the form of these crystals the composition of them?—As regards at least two substances I think I can, distinctly; these are sulphate of potash and nitrate of potash; there is a little unburnt saltpetre after the combustion of the gunpowder.

19,606. (*Sir P. Grey Egerton.*) Did you analyze them?—I have also analyzed them. I washed out a considerable number of these tubes and analyzed the result, and proved that these crystals do exist, chiefly sulphate of potash. It would be scarcely possible to obtain the result from one tube, but by having several tubes it is very easy.

19,607. (*Dr. Greenhow.*) I observe that you have marked upon some of these drawings that the samples of air were taken immediately after an explosion; are you aware whether that was the case with the whole of them?—In some of them it was a considerable time before explosion.

19,608. That is to say, at a time when there would probably be a smaller amount of these impurities in the air than would be the case at most other times?—Yes; I requested Captain Rowe to give me a few specimens immediately after explosion that I might see the difference.

19,609. (*Chairman.*) But the others were taken from the tubes as sent to you?—Yes.

19,610. There were only a few which were taken at your own special request immediately after explosion?—I think only two; I have, in most cases, marked down the relative amount of crystals formed. I have spoken of salts of potash. I obtained the potash by direct analysis; it existed in considerable quantities. Ammonia was found in the tubes to a considerable extent. Some of this ammonia would no doubt arise from the organic matter, but the greater amount must be supposed to come from the gunpowder. This prevents us from using the ammonia as a mode of estimating organic matter. I have somewhere the exact amount which I got in a cubic yard of air. The organic matter was found in very decided amounts by more than one method. It was obtained in the common way by boiling down the solution, that is, after washing the tubes with water and drying them. It was readily perceived by a blackening or by leaving charcoal when treated with sulphuric acid. It was also obtained by the use of permanganate of potash, which was a ready mode of observing it.

A very curious mode of examining the air came out which appears very trifling, and which at first seemed to me ridiculous, but which I think promises very valuable results, and to me is quite as certain as the more exact chemical method, but the objection to it is that it gives no figures ; this is, by the use of the sense of smell. By simply opening a tube of impure air and smelling it when we ourselves stand in a pure atmosphere, the result is so decided that practically analysis becomes unnecessary, at least when the impurities are of such a kind as are found in these tubes and in many unwholesome places. The examination of air for practical purposes will, in many cases, be performed by a man unskilled in science, if taught to examine it in this manner. I have been able, by the mere sense of smell, to distinguish in these tubes, tallow, tobacco, perspiration, and that closeness which has no name, but which we believe arises from carbonic acid and organic matter mixed. When we enter this region, namely, of smell, the fancy is apt to lead us astray, but in this case the results were beyond all my expectation, and such as I should have held to be quite impossible. They were confirmed also by others in my laboratory ; in fact they were too gross to allow of any mistake being made.

The following are the general conclusions which I draw: I believe that the inquiry shows without the shadow of a doubt the nature of the impurities of the air in gross, and proves also that they may be considered as the principal causes in operation affecting the health of miners. I believe also that the results show that something more than ventilation may be expected, and experiments are wanted to show how far a substitute for ventilation in some cases and to some extent will be effective.

19,611. Having proceeded so far in this inquiry, do you think that in order to complete it fully, and to enable you to give a complete report as to the state of the air in different mines according to the samples which have been submitted to you, further inquiries are necessary ?—I believe so. I should be sorry to leave it in this condition, although the part which I have done, I believe, leaves no doubt in itself. All the experiments are clear and distinct, but the experiments which have been made lead to others which I think would be not only of practical value but of scientific value also.

19,612. Can you state some few of the points which you think should be more specially inquired into ?—I should think it well to inquire into the exact relation of carbonic acid to the impurity of the air, that is to say, whether it is actively or passively injurious. For example, thus far to find the smallest amount perceptible to the senses, if the pure gas is mixed with the air, or to find how much is hurtful or perceptible if the gas is mixed with organic matter, such as animal exhalations. These questions are, I believe, practically important, and have never been decided by any one ; and I believe the work could be done without great difficulty.

19,613. Are there any means by which you could make those tests, such as a hermetically sealed room or otherwise ?—I have been promised the use of a hermetically sealed room for the purpose, and I would employ it in this manner :—I would pour pure carbonic acid into the room until I found it uncomfortable ; it would be a room sufficiently large for two or three people to sit in. I should also make another experiment using no carbonic acid, but simply sitting in a room until the breath caused the atmosphere to be offensive. Experiments of that kind I think would lead to the conclusions which are desired.

19,614. (*Dr. Greenhow.*) What conclusions do you expect from those experiments ?—I wish to know whether it is the carbonic acid which is actively injurious in a crowded room or the organic matter. My own observation leads me to believe that it is not the carbonic acid ; that is to say, that the carbonic acid is not so hurtful as the organic matter.

19,615. By what process would you arrive at the conclusion ; would it be merely by your own senses ?—I think that the senses must be the only guide in all this, because it is by the sense that we know when a room is unpleasant. I might also use some animals for the same purpose. They have perhaps less prejudice, but I should rather use the human being as the test than any other animal.

19,616. Would not such experiments constitute an investigation interesting in a scientific point of view rather than practically applicable to the atmosphere of mines ?—I have thought not. My intention was to apply it to the mines. It has seemed to me that in many cases the air would be rendered pure, or almost pure, by simply washing it when there was a difficulty of ventilation. If the atmosphere in some of the dark corners of these mines were washed with lime water all the dust would be taken down, all the crystals would be removed, all the carbon would be removed, and the carbonic acid itself would be removed ; and, in fact, out of the long list of substances which are found in the air there would remain perhaps not above one or two, and these existing in small quantities ; the one or two are hydrogen and carbonic oxide. That air would then be nearly pure, but there would be a deficiency of oxygen to an extent varying up to three per cent. It is possible that when the deficiency of oxygen was very small the removal of these substances would render the air perfectly wholesome. This experiment would show whether it would render it perfectly wholesome or or not. Supposing that the air were washed in this manner the diffusion would occur much more rapidly, and I believe that the normal amount of oxygen would be much more rapidly obtained after that, so that I think that the experiments would lead to distinct practical results in the mode of purifying the air. My idea was, that in the working space in one of the levels a fine spray of lime water, like a Scotch mist, should be used to wash the air. The operation of washing the air in this manner is seen better perhaps than anywhere else exactly under us. Mr. Goldsworthy Gurney uses it for cooling the air which is brought into the House of Lords. He uses pure water. The amount of water required is very small, and the operation is very simple. I think there can be no doubt of the great benefit which would result from that mode of operation ; and I think also that it would render a difficult and expensive mechanical ventilation less necessary in many places, at least, it would make it a lighter matter if it did not entirely do away with it.

19,617. You appear to be mixing up two things,—my questions have reference only to the experiments you propose to institute relative to carbonic acid gas ; and the point which I wish to ascertain from you is their direct bearing upon the purposes our inquiry ; I wish to have that clearly made out ?—I believe that if the carbonic acid were the chief ingredient which rendered the air injurious, as has been popularly the view for so many years, the washing of the air would be less available ; but if the organic matter and these other substances are more powerful than carbonic acid, we should be able to separate the results of the two, and to see how much is due to the one and how much is due to the other, and we should also be able to arrive at how much is due to the absence of oxygen. We should then have three inquiries, namely, how much is due to the absence of oxygen, how much is due to the existence of carbonic acid, and how much is due to the existence of animal and other exhalations. I wish to separate those three distinct conditions from each other. They have never been separated, and I think that the method of purifying the mines cannot be settled until those conditions are distinctly separated.

19,618. (*Mr. Holland.*) Are you aware of any evidence which proves that a small deficiency of oxygen alone is injurious, say a deficiency of one-half per cent. or one per cent. ?—I am not aware of any evidence upon that point, supposing the air to be otherwise pure.

LONDON.

R. A. Smith, Esq., Ph. D., F.R.S.

17 June 1863.

19,619. Are you aware of anything which proves that the mere presence of carbonic acid in small quantities is injurious?—I am not aware of anything sufficient. I have been making some experiments myself on that point. I went into a room in a brew-house where the carbonic acid amounted to ·27, rather more than a quarter per cent., and the atmosphere was very pleasant to breathe, nobody could object to it.

19,620. It was ·27 of the whole air?—Yes; it was by no means unpleasant.

19,621. What was the apparent effect of it?—It seemed to have a fresh and rather a pleasant effect than otherwise; whereas if you enter a room which has ·27 per cent. of carbonic acid in it caused by respiration, the effect is extremely oppressive, and it would be equal to one of our very badly aired public assemblies.

19,622. Is not the fair inference from that that the oppressiveness is not produced by the carbonic acid but by something else?—The inference is that the carbonic acid has only partly to do with the result, but a great point is to know how much it has to do with it, and I think that that inquiry must be made before any conclusion can be arrived at.

19,623. And not only for this investigation, but for all investigations concerning the action of air upon life?—Yes, for all similar investigations. Probably a very different result would have occurred if I had gone up to ½ per cent.; it might then have been too irritating; there was a certain roughness, but still it was pleasant. I do not know how it would have been if I had lived there a whole day.

19,624. What was the effect of such air as that in the brewhouse upon the men who were working permanently there?—There were no men permanently in that room; it was pleasant air although it was easily perceived that it was not normal air.

19,625. If I understand you rightly, you mean that we know nothing at all about the effect upon comfort of the mere absence of a small quantity of oxygen, and the mere presence of a small quantity of carbonic acid?—Our information is not sufficient; the two conditions are mixed in all our experiments.

19,626. They are mixed with other circumstances, which may produce the effect that you have attributed to the absence of oxygen and to the presence of carbonic acid?—The carbonic acid and the organic matter are generally spoken of confusedly; there can be no question about the other substances, the solids.

19,627. I understand that you intend to try experiments in an air-tight room?—Yes.

19,628. Might there not be in that air-tight room a very near imitation of a close end of a mine?—I intended to make it so.

19 629. You might explode gunpowder in it if you wished, and imitate it very closely?—That might be done, although the imitation would never be exactly the same as the original. I believe that if the impurities and the exhalations from the body remain long, they become more offensive, and probably putrefactive; the condition would never be exactly the same.

19,630. (*Chairman.*) The test which is used by miners when the air is very bad is that of the lights going out; what do you think is the occasion of the lights going out?—I wish to make experiments upon that subject also. The lights do go out in air such as I have tried, containing 16 per cent. of oxygen, but that depends a good deal upon the motion of the air; if a current is carefully produced, even a tallow candle may be induced to stay in longer than that, and may burn until there is a little more than 15 per cent. Then again it seems to me from accounts which I have received from miners, and partially from observations in mines, that the candle is inclined to diminish in light, and also appears inclined to go out a considerable time before 16 per cent. is reached. I am not quite sure of the cause, but I think that it is partly owing to the solid matter floating in the air. I have found from experiments upon the combustion of oil that extremely minute particles of solid matter completely prevent the combustion of oil, that is to say, they completely prevent a wick from acting as a proper conductor for oil.

19,631. (*Mr. Holland.*) What is the effect of using a chimney glass to a lamp?—It causes a greater current, and causes the light to remain longer.

19,632. It will burn with a smaller proportion of oxygen?—Yes.

19,633. Because of the extra draught?—Yes.

19,634. (*Chairman.*) What other experiments do you think it desirable to make in order to institute the full inquiry?—I wish to ascertain the effect of the absence of oxygen separately from the effect of carbonic acid. Supposing that this air were washed in the mode which I have proposed, there would then be an absence of oxygen, but there would not be the presence of those deleterious substances which have been mentioned. It would be important to know of what value this air, after being washed with lime water, would be for breathing and for burning. I think that this experiment has never been tried, and I think that it would be valuable; perhaps it has been tried by some one unknown to me. I have been making some experiments upon the mode in which the air is supplied to the depth of very long levels. I have some results of these, but not the whole results; and I should like to finish them. It is quite clear that after a time the very remote recesses of long levels become supplied with air very nearly normal, and even at very great depths, even in mines at a depth of 190 fathoms. I have thought it interesting, and perhaps practically of importance to know how the air enters. I have, therefore, obtained specimens of air from the floor of the level and air from the roof of the level, in order to watch the progress of the air to see whether there is a current below and a current above. My object in doing that would be to see how much could be expected from the action of diffusion of gases, and how much from the ordinary mode of ventilation by current. If the diffusion of gases will make up the air which I have supposed to be withdrawn, then, of course, we have a very great gain; we shall get pure air below without so much ventilation, or perhaps without any. To answer that question I think would be very important, and I think that the results would, practically speaking, be very valuable. There are some other experiments which would be necessary, in order to make the investigation complete; but I think they would not be of practical importance, although they would certainly be of scientific importance. I have, for example, been unable to obtain the amount of carbonic oxide and hydrogen in the air by experiment as I have hitherto used small specimens.

19,635. Will you explain the difference between the diffusion of gases and a current?—Ordinary ventilation is made by currents, that is to say, the warmer air rises and the cooler air enters below; but if any two gases, or any two atmospheres, are in juxtaposition, there is a natural tendency in the atoms of the gases themselves towards motion; and these move into each other or become diffused until an equilibrium is obtained; this is entirely independent of temperature.

19,636. (*Dr. Greenhow.*) Does not it depend in a certain measure upon the density of the gases, and will not gases of different densities mix more rapidly than gases of the same density?—The rapidity of diffusion is inversely as the square root of the density of the gases; a lighter gas, hydrogen, for example, will diffuse very rapidly, carbonic acid will diffuse very slowly.

19,637. (*Chairman.*) Is there any other essential point of inquiry?—I should think that it would be important to make experiments on the simplest mode of trying the air, so as to be useful for overseers and others.

19,638. You think that it would be of very great importance to agents and others engaged in mines to have a simple mode of testing the air other than by the candle?—Yes.

19,639. (*Mr. Holland.*) Are you hopeful of suc-

ceeding in that?—There are four or five methods, all of which promise something, and I should like to try them for some time, and to give them comparative value.

19,640. (*Dr. Greenhow.*) These last experiments on the simplest mode of testing impure air might be tried in your laboratory, might they not; without necessarily going down a mine for the purpose?—I could collect impure air anywhere, but I should prefer to take such impure air as had been produced by manufacturing operations in some way or other, such as really existed, rather than to form artificially impure air. In the next place I think that there should be some experiments made upon a mode of purifying the air somewhat in the way which I have suggested, or in other ways. Then it is necessary, I think, to continue the examination of the numerous specimens of air now on hand.

19,641. (*Mr. Holland.*) When you speak of purifying the air, do you mean the purifying the air without removing it?—Yes.

19,642. (*Sir P. J. Egerton.*) Have you tested any of these samples for ozone?—I have not. I never expected to find any ozone in them.

19,643. (*Mr. Leveson Gower.*) Would not the simplest way of trying the effect of washing the air be to try in a mine in which bad air exists?—I think that would be the best way; specimens would require to be taken before and after; the operation is not extremely simple, because at present all the passages of the mines are filled with air more or less impure; the impure air is making its way to the shaft upwards, and therefore it fills every space as it goes on with part of itself; and in making the experiments a good deal of this impure air would rush back; it would be well, therefore, to obtain a mine where the passages were very pure, in order to see how the depth of the level would fill with normal atmosphere. It is not in every mine that such a choice could be obtained.

19,644. (*Mr. Holland.*) Could not you try the experiment with a hydrant without much expense?—I think so; the chief difficulty would be in finding a good mine.

19,645. (*Mr. Davey.*) Would there not be difficulty in introducing the water?—I think not. I think it might be done by something like a garden syringe, and the assistance of a similar apparatus to that which is used for cooling the air in the House of Lords.

19,646. Would it not require pure water?—I propose lime water; the water of the mine would be sufficient in all cases for dissolving the lime.

19,647. (*Mr. St. Aubyn.*) Have you ever made any experiment, or can you form any idea of the comparative quantity of water which would be required to make this experiment on a certain number of cubic feet of air?—I have not a very good idea of that; it is just one of the points to be settled, but it seems to me, on thinking it over, that it would be a great convenience if the men would throw something like a gallon or two in the working space around them.

19,648. How many cubic feet of air would a gallon of lime water purify?—I have no idea, as a good deal would fall ineffective; but in examining that subject it seemed to me that it was a very frequent case that a level proceeded forward at a distance from a winze extending somewhere about 50 feet, and I have made a number of calculations upon the supposition that there is a space 50 feet long, 6 feet high, and 4 feet broad, in which the men are working. It seems to me that taking that space a few gallons might purify 1,200 cubic feet of air.

19,649. (*Sir P. Grey Egerton.*) Then in that case one of the hydro-pults or garden engines would be sufficient?—Something like that; but I would use the water much more economically than they do, as the spray would be exceedingly fine. If the Commissioners were to observe the mode in which the ventilation of the House of Lords is conducted, or rather in which the water is cooled for it, I think it would be at once seen that an exceedingly minute quantity of water does for a very large portion of air.

19,650. (*Mr. St. Aubyn.*) Is it necessary that the water should be very pure?—I think not; I think that the water of the mine is sufficiently pure; there is a little copper in it sometimes and a little iron, but these would be thrown down by the lime, and in fact nothing but lime water and a little sulphate of lime would remain.

19,651. In an ordinary mine would the common mine water be sufficient for that purpose?—I expect so.

19,652. (*Mr. Leveson Gower.*) Apart from this experiment, is visiting any more mines desirable for the purposes of your inquiry, or could you pursue that inquiry by having the air sent to you?—Except to perform certain experiments I do not propose to visit more mines, but to have the air sent to me from many others. It is a great pity I think not to make an inquiry perfect when it is begun; I should be sorry to see any part of the kingdom left out.

19,653. Then you consider that it is requisite, in order that your inquiry may be perfect, that you should visit some more mines?—I should prefer writing a complete report to writing an imperfect one, and I think it would be better for the purposes of the Commission.

19,654. (*Chairman.*) Do you think that it would be desirable to investigate the air of foreign mines?—It seems to me that if the Commissioners reported, without knowing the opinions of foreign scientific men upon the subject, there might be a danger of being behind in some parts instead of being before, as I think they might expect otherwise to be. I was especially desirous of visiting some of the mines of Germany, and indeed I shall probably do it for my own satisfaction. Those mines are worked with, perhaps, more scientific care than any mines in the world; there are professors, in Saxony especially, of every branch of mining, who are continually studying the subject, and I think that, considering the character of the German professors, we may be perfectly sure that they have made many observations that will be valuable to the Commission, and I should be sorry to write a report without knowing their opinions. On a subject like this reading is not sufficient.

19,655. (*Mr. Leveson Gower.*) Are you acquainted with the work of Monsieur De Combe upon mines?—No; I know that it is one of the largest and most complete works upon the subject; but I asked a friend, a mining engineer in France, to give me some information about it, and he said that it did not contain any analysis of the air of mines, so that I did not obtain it.

19,656. Is air in which the burning of a candle is perfectly unaffected ever objectionable air for men to work in?—I think that it may be very objectionable, even though a candle will burn in it.

19,657. (*Mr. Kendall.*) You think that a candle may burn well and still that the air may be injurious to health?—Yes.

19,658. Will you give an instance of that?—I believe that a candle will burn till there is about 15 per cent. of oxygen, and I believe that a man will feel very uncomfortable when there is even 20½ per cent., if there be carbonic acid and the usual exhalations from the human body. When I say 20½ per cent. I am keeping rather low, because I might say 20·7 for example, without being considered to err.

19,659. (*Mr. Holland.*) You mention an ordinary room?—Yes.

19,660. (*Mr. Leveson Gower.*) When there is no perceptible influence on the burning of the candle may the air be bad for the men to work in?—I do not think that the influence is perceptible in a room with 20 per cent. of oxygen, which is a very badly ventilated room indeed.

19,661. Probably you have not quite made up your mind upon the point; you have never turned your

LONDON.

R. A. Smith, Esq., Ph. D., F.R.S.

17 June 1863.

attention to it?—I have not made sufficient experiments yet, but I have thought a little upon the subject; for example, in a room badly ventilated, containing probably 20·6 per cent. of oxygen, I have never seen that there was any perceptible difference in the candles burning.

19,662. (*Mr. Kendall.*) As I understand you, you think it is very possible that a candle may be burning well and you may not perceive any deficiency of oxygen, as far as the candle goes; there may be enough for the candle and still not enough for the men?—That is quite certain. Although what I am about to state does not perhaps apply to mines, yet if sulphuretted hydrogen for example were in the air to the extent of ·01 per cent., I believe that none of us could exist long; and even the Manchester air and the air of the manufacturing districts, which is perceived to be inferior by those who enter it, is made impure by an amount represented by a decimal with either four or five cyphers after the decimal point; whether there are four cyphers or five I cannot say at this moment, although I made the experiment myself. That impurity is sulphurous acid, but with sulphuretted hydrogen I believe that a still smaller quantity is injurious.

19,663. (*Mr. St. Aubyn.*) It would have no effect on the candle?—Not the slightest; in other cases, too, a candle has a peculiar power of burning in air in which it is very difficult to breathe, and I will give an instance. When Dr. Frankland was at the top of Mont Blanc he tried the combustion of a candle there, and he found that it burnt exactly the same amount of tallow up there as it did down in the plains. It adapts itself to different conditions of the air in a very remarkable manner. The flame in the rare atmosphere elongated itself in order to have a greater space from which the ignited gases might obtain oxygen, but still it burnt the same amount of tallow, and did not go out.

The witness withdrew.

ALBERT J. BERNAYS, Esq., Ph.D., examined.

A. J. Bernays, Esq., Ph. D.

19,664. (*Chairman.*) I believe that you are a professional chemist?—Yes.

19,665. You are at present engaged at St. Thomas's Hospital?—I am professor of chemistry to St. Thomas's Hospital Medical College, and physiological chemist to the hospital.

19,666. You have, I believe made the subject of air to some extent your study?—Yes; to a very considerable extent.

19,667. You have lately made some experiments with regard to air with especial reference to the future site of St. Thomas's Hospital?—Yes.

19,668. I believe that at my request you made some experiments with regard to some bottles of air which I sent up to you from different places?—Yes.

19,669. Did those bottles describe the mine or the level where the air which was in them was taken, or were they numbered?—The greater part of them were only numbered and lettered. I had but scanty information as to where they came from.

19,670. Will you describe what the bottle was?—I had a number of wine bottles sent to me, the greater part of them holding about 46 cubic inches. I could see from the remains that they had been filled in the mine by taking them down full of dry sand; the sand of course was emptied below, and the bottles were filled with the air of the mine, and they were properly sealed. I found in two cases where the bottles had been cracked that the air was normal air, but in the other cases the majority contained a very impure air as far as regards carbonic acid.

19,671. (*Dr. Greenhow.*) They were hermetically sealed I conclude?—They were sealed as completely as could well be done; they were thoroughly well corked and waxed.

19,672. (*Chairman.*) Can you state shortly the result?—I can give you briefly a few facts with reference to them.

19,673. How many specimens were there?—About 40. I should say that I have not made the absolute corrections which are necessary for pressure and temperature, comparing the mine with the time when I made the analysis, but my own experiments were with the barometer at 30″, and the thermometer at the ordinary temperature of 60°. I do not know how I can make the matter simple except by stating, that, with only two or three exceptions, there is not a single air out of the 40 specimens which I have examined which does not contain one-fifth of one per cent. of carbonic acid, while they go up as high as 2·2 per cent. of carbonic acid.

19,674. You did this by an agreement with me at a very moderate charge, and you did not go so fully into the matter as you otherwise would have done?—Having ascertained the process to be an accurate one I made the weighings as accurately as they could possibly be done, and every one of them has been corrected; various of them have been done twice over with almost precisely the same result. Whenever I found that the quantity was very abnormal, I took a small quantity of the air and shook it with lime water; and as a proof of the general accuracy of the methods which I adopted, I may state, that in the one case which your Lordship has mentioned to me of a mine which was said to be properly ventilated, I was absolutely not able to weigh the carbonic acid, whereas in all the other cases the weight is on the average never less than 2 in the 1,000; and reaching in one case to 22 in the 1,000; in 17 cases to 11 in the 1,000 and 12 in the 1,000, and in very many cases to 4 in the 1,000. That I think will explain the general facts with reference to the 40 atmospheres.

19,675. As far as you have gone you are quite satisfied that the experiments are correct as to the amount of carbonic acid?—Yes, I have no doubt whatever about it, and that as a comparative result they are as accurate as anything can well be. They have all been done by the same method, which I had proved by experiment to be correct.

19,676. (*Mr. Holland.*) The best of these airs had more than double the usual quantity of carbonic acid?—Far more; we generally calculate I think about 0·4 in the 1,000, or from 0·035 to 0·04 in the 100.

19,677. You are speaking of country air?—Yes; in towns it may rise somewhat.

19,678. (*Dr. Greenhow.*) That is to say that the smallest of these specimens would have five times the normal amount of carbonic acid gas?—Yes; quite that; it is far above it if you take the average of the 40 specimens, but of course that is not a fair way to take them.

19,679. (*Chairman.*) I suppose that you have had no opportunity of making experiments as to other impurities in the air?—The only impurity which I ever carefully sought for was sulphuretted hydrogen, and that was never present; there was no form of sulphur which could be discovered in the air.

19,680. Have you ever tried an experiment with regard to candles; what state of the air would put a candle out?—I have never made a careful experiment, and I do not think that there is any accurate information with reference to the point. I feel perfectly confident from the analysis which I have made of these airs, that not one of them would put out a candle. That is my idea at least.

19,681. Should you say that it would affect it in any way?—The high figures would affect the candle in lengthening the flame and dimming it.

19,682. (*Dr. Greenhow.*) Can you tell the condition of these specimens of air as regards the amount of oxygen?—I cannot. Lord Kinnaird only asked me to determine the amount of carbonic acid.

19,683. (*Chairman.*) From the inquiries which

you have made, do you consider that the character of the mines calls for further inquiry?—With reference to the quantity of carbonic acid, it seems to me that the inquiries which ought to be made, if they have not been made by my friend Dr. Smith, are with reference to ascertaining whether these conditions are normal or accidental; in fact, to what extent these are constant quantities. It would have been very advisable if the air could have been taken two or three days running at different times of the day; I should myself have been much more satisfied as to the information.

19,684. Have you been down any coal mine?—I have never been down, but I have been a great deal into the neighbourhood of coal mines. I know a great deal about the men who work in coal mines, from a long residence in Derbyshire.

19,685. (*Mr. Holland.*) Have you analyzed the air of any coal mine?—Never, unless some of these airs are from coal mines, which I really do not know.

19,686. (*Chairman.*) Do you believe that it would be possible to employ a chemical agent with any effect for purifying the air of a mine?—That is a question which I certainly have thought about, but I am not aware to what extent at present it could be done, and I certainly should not like to hazard an opinion without an experiment, but my idea is that it would be possible. Of course, if we are to take the experiments which have been made with reference to pure air and foul air, there is not a doubt that the impurity of these airs is something extraordinary; it is far greater than what I believed to have been possible.

19,687. Do you mean possible for men to work in without injury to their health?—Yes; in my own experience miners always carry the foul air with them. They are not only satisfied to work in the foul air in the mines, but when they go home they stop up every possible crevice in their houses. I have been in miners' houses, and I could scarcely breathe; I had to go out of the house almost stifled. In Derbyshire it is a common thing for them to shut themselves up and not move out of the house if they have nothing to do, and to keep the temperature as high as it can be made.

19,688. That would affect the other inmates of the house as well as those who were working?—Yes, I believe so.

The witness withdrew.

[*For Questions Nos.* 19,689 to 19,757, *see Appendix B. p.* 154.]

Thomas Bevill Peacock, Esq., M.D., examined.

19,758. (*Chairman.*) You are a Fellow of the College of Physicians?—Yes.

19,759. You are senior physician of the Consumptive Hospital at Victoria Park?—Yes.

19,760. And physician to St. Thomas's Hospital?—Yes.

19,761. I believe that you have had great experience in diseases of the chest?—I have devoted myself perhaps more especially to that department of medicine for a good many years.

19,762. I believe that at my request you kindly undertook to visit Cornwall in the autumn of 1862, in order to examine into the state of health of several miners?—I did.

19,763. You went underground, I believe?—I went underground at Dolcoath.

19,764. You examined a great number of miners at work and above ground?—I examined upwards of 600 of the men who were at work, and 83 men who were ill, taking full notes of the cases of 63.

19,765. Did you examine also the men on coming up to the surface by the ladder?—Yes; I saw a considerable number.

19,766. And men coming up by the man-engine?—Yes.

19,767. And at their own houses?—Yes, I examined many of the miners at their own houses, but more particularly those who were sick.

19,768. You visited also some of the cottages?—Yes, I went into a good many of the cottages.

19,769. In short, you made a very thorough examination of the condition of the miners, and of what is called the miners' disease?—I think that I did so.

19,770. Did you have any opportunity of post mortem examination?—Yes, in one case.

19,771. You are, I believe, prepared to give the Commissioners a report?—Yes, this is my report (*delivering in the same*).

19,772. This report contains a full account of all the cases which you examined?—It contains, in the first place, a statement of all the cases of disease which I examined—63 of them being fully reported, and 20 others of less importance. There is next an account of the state of upwards of 600 men, more cursorily described, who were regularly at work in different mines; and, lastly, there is a general report founded upon those observations.

19,773. I suppose that you have no doubt of what is the actual disease called miners' disease?—I think that under the popular term "miners' disease" different affections are included. As a general remark miners' disease seems to be chronic bronchitis and pneumonia, but the precise form which the disease may take depends to a considerable extent probably upon whether the miner is originally of sound constitution or otherwise. If he be pre-disposed to consumption he suffers from a form of consumption, but if on the contrary he is not so pre-disposed, he becomes subject to chronic bronchitis and emphysema with consolidation of the lungs. The case which I examined was of the last description—there were no tubercles in the lungs at all; but there was chronic bronchitis, considerable consolidation, and several cavities.

19,774. What was the age in that case?—It was 55.

19,775. Have you prepared tables showing the condition of the men when you examined them?—There will be found a table including 464 examinations of men who were at work.

19,776. These tables will give very much the history which the men gave you of their life?—Fully so.

19,777. And also of the symptoms of any disease which you discovered?—Yes.

19,778. (*Mr. St. Aubyn.*) Were the miners you examined all from one district?—No; I visited the Par Consols Mine near St. Austell, the Dolcoath and United Mines in Cambourne and Gwennap, the Wendron Consols and the St. Ives Consols, and Botallack, Levant, and Wheal Owles, in the St. Just district. The men I examined were chiefly from the districts of Cambourne and St. Just; but I saw several at Liskeard, both who were sick and others still at work.

19,779. In fact they were taken generally?—Yes, throughout Cornwall.

19,780. (*Dr. Greenhow.*) This may be taken, therefore, as a fair representation of the state of the miners employed in Cornwall generally?—Yes. My object in going to Liskeard was to compare what I had seen in West Cornwall with the condition of things there. My observations at Liskeard entirely confirm those made in the other districts, although I had not the same opportunity of examining patients at Liskeard as in the western districts.

19,781. (*Chairman.*) I believe that you also examined several of the schools and children?—Yes; I visited some of the schools, and I particularly paid attention to the women and children that I saw at work at the mines.

The witness withdrew.

[*For Questions Nos.* 19,872 to 19,846, *see Appendix B. p.* 180.]

WREXHAM.

Wednesday, 15th July 1863.

PRESENT :

The Right Hon. Lord Kinnaird, K.T.	Nicholas Kendall, Esq., M.P.
Sir P. Grey Egerton, Bart., M.P.	John St. Aubyn, Esq., M.P.
The Hon. E. F. Leveson Gower, M.P.	P. H. Holland, Esq.

The Right Hon. Lord KINNAIRD, K.T., in the Chair.

Captain John Darlington, of Minera Mine, Wrexham, examined.

Wrexham. — *Capt. J. Darlington.* — 15 July 1863.

19,847. (*Chairman.*) What is the produce of the Minera mine, lead or copper?—Lead and blend; black jack, as they call it.

19,848. You have charge of the Minera mine?—Yes.

19,849. How many years have you had charge of that mine?—Twelve years.

19,850. Have you charge of any other mine in the neighbourhood?—I have not.

19,851. About how many men have you underground?—I think 355 working underground.

19,852. Are there any boys working underground?—No.

18,953. How do the men enter the mine?—By ladders, generally speaking.

19,854. What is the greatest depth at which you are now working?—220 yards.

19,855. Are there many shafts to the surface?—There are. I cannot say exactly how many; but I should think that you may safely say 25.

19,856. Do you use any artificial means of ventilation?—No there is no mine in the world which is better ventilated, I should think.

19,857. So that you do not require any artificial means of ventilation?—We do not.

19,858. How far do you think you could drive an end from any winze or shaft?—We have driven as much as 160 yards; but generally speaking I should not think more than from 80 to 90 yards.

19,859. When you were driving 160 yards how long did the powder smoke hang there?—I should think that it might be two hours.

19,860. Did you use any artificial means of ventilation when you were driving the 160 yards?—We had a fan.

19,861. How was it worked?—By what they call in Cornwall a duck machine. It is two boxes; one box working in water.

19,862. (*Mr. Holland*). You mean Taylor's duck machine?—Yes.

19,863. (*Mr. Kendall*). Are you a Cornishman?—Yes.

19,864. (*Chairman*). Was it attached to the engine?—No, it was worked by manual labour; a boy worked it.

19,865. In what kind of pipes was the air taken?—Our pipes were about 5½ inches. We have had wooden pipes, but we now use zinc pipes; there does not appear to be so much friction in the zinc pipes. There is perhaps no mine in the kingdom in a stratified district which is freer from the carbonic acid gas than this mine is.

19,866. Do the men go in immediately after firing?—Perhaps in about a quarter of an hour.

19,867. What is the longest distance which you are now driving from any winze?—90 yards.

19,868. Have you any artificial means of ventilation there?—No. I am very much surprised to find how it is. I can hardly account for it.

19,869. Do you know how long the smoke hangs there?—I should think that it is about the same time.

19,870. Do the candles burn well there?—Capitally.

19,871. Have you never any complaints?—Never.

19,872. Do you think that there any crevices in the rock or any swallows?—In some of the caverns, which you will find in the limestone district throughout the kingdom and throughout the world, there is generally contained some carbonic acid gas, and as soon as it is let free, of course it is heavier than the common atmosphere, but at the same time we get rid of it almost immediately. We have an immense current of air through our mines.

19,873. Is the mine wet?—Yes, in some places.

19,874. Where you are working now, at 90 yards, is it wet?—No, it is very dry indeed.

19,875. Is it dusty?—No.

19,876. Is it worked by the pick at all?—Very little; most of it is blasting.

19,877. In bargaining with the tributers and tut workmen, do they get rid of the deads or do you draw the deads?—They get rid of them; they are bound to pay all expenses.

19,878. And to remove the deads themselves?—Yes.

19,879. Have you ever to fine them if they do not do so?—We very often are obliged to threaten to do so, but I believe that they behave very well in general.

19,880. So that they generally remove the deads?—Always.

19,881. Have you any accidents from blasting?—We have had two.

19,882. (*Mr. Kendall.*) In what time?—One of them was five years ago last month and the other was somewhere about six months since.

19,883 (*Chairman.*) Were they fatal accidents?—One of them was fatal, but I think I can easily account for how that man was killed. I always caution the men very carefully indeed, and urge them to put in something, a small quantity of moss or grass upon the powder, so as to keep it down, but this man took some paper out of his pocket, as I understood, and in that paper, I think, there was the end of one of the lucifer matches, and as soon as he commenced the operation, it exploded; it killed the man; he did not die immediately.

19,884. (*Mr. Kendall.*) That is merely your own idea?—Yes.

19,885. (*Chairman.*) What material do they tamp with?—Shale. I fine a man very severely indeed, if I know him to tamp with anything of a silicious substance; anything like spar, or anything of that sort which has fire in it.

19,886. Have they always shale at hand?—Always.

19,887. Is there much shale in the mine?—There is not an immense quantity, but there is plenty for that purpose everywhere.

19,888. Do you work the machinery with steam boilers or with water power?—It is all steam; we have thrown aside the hydraulic engine since we brought up the great level.

19,889. The mine was an old mine?—It was.

19,890. Do you make use of the old workings?—Yes, we have unbottomed the old workings about nine months, but all our riches have been new discoveries.

19,891. Do the men when they come to the surface, change in the boiler house?—I very unfortunately made an oversight the other day when your lordship was there in not showing you the place where they shift their clothes; we have a very nice place—indeed we have nice places.

19,892. Is it large enough for all the men?—Yes; we have 355 men, and I think that you would never see better accommodation for shifting.

19,893. Do they all go from the different parts of the mine to that place ?—No.

19,894. They do not all make use of it ?—No.

19,895. You have smaller ones ?—Yes.

19,896. There are, I believe, no women working on the surface ?—Not one.

19,897. How many hours do the men work ?—Eight hours ; the time for which we wish them to stop, but they do not work more than six ; I could not say six and a half.

19,898. Your bargain is eight hours ?—Yes.

19,899. Have the men any small ventures of their own ?—No.

19,900. They do not work at their ventures ?—No, we do not allow that.

19,901. What allowance of candles have the men ?—Two lbs. a head.

19,902. What do the men pay for candles ?—About 6*d.*

19,903. And for powder the same ?—Hardly that ; the men pay exactly the cost price ; the powder is 45*s.* a cwt.

19,904. Is there any club attached to the mine ?—They have a sort of club amongst themselves, but the sick clubs about are numerous.

19,905. Is there a doctor attached to the mine ?—We have a doctor ; indeed we have three, I think ; the men make choice of their doctor ; every man makes choice of his own doctor.

19,906. Is the sum which they pay to the doctor a fixed sum ?—I think it is 2*d.* a head per month. I am not exactly sure; it used to be that.

19,907. But there is no account kept between you and the doctor ?—No.

19,908. How often do you pay the men ?—Every calendar month.

19,909. Is a month kept in hand ?—There are about nine or ten days in hand.

19,910. Do you pay in notes or in small change ?—All in gold and silver and in pence ; we never pay anything like a note.

19,911. (*Mr. St. Aubyn.*) Are you a Cornishman ?—I am.

19,912. Are you acquainted with the working of mines in Cornwall ?—Yes.

19,913. In what district ?—I have been in the Gwennap Consols and the United Mines, and in Skirby a good deal.

19,914. Have you been in the mines about Camborne ?—Never about Camborne ; but I spent a great deal of my time in St. Austell district, in East Crinnis and Pembroke, and that neighbourhood.

19,915. You say that the mines here which you are engaged in are remarkably healthy ?— They are indeed.

19,916. There is, as you know, a great difference in that respect between these mines and the Cornish mines ?—Yes.

19,917. Can you tell us, in a few words, to what you ascribe that difference ?—I imagine that there is an immense quantity of a foul kind of air which is always hanging about the killas in Cornwall, a sort of carbonic acid gas which is always hanging about it, and the miner inhales that, and consequently it brings on what they call a decline in Cornwall, but you never find that here. I most positively declare before you that I think that the average life of every miner in this country is above 55 years of age.

19,918. Then you ascribe the difference to natural causes ?—Yes.

19,919. And not to any difference in the mode of working the mines ?—I do not know a man who has died from anything like bad air that he received in the mine.

19,920. Are the mines, generally speaking, as deep here as in the Cornish mines ?—No, there are none in this country like the Cornish mines.

19,921. They are all descended by means of footways ?—Yes, they are just now ; the men go down by ladders.

19,922. You have no such thing as a man engine or a skip ?—We have a skip.

19,923. But the men do not use it ?—No.

19,924. Have you any places more than 100 fathoms deep ?—No, the deepest place is 220 yards.

19,925. (*Mr. Kendall.*) You attribute the difference in the health of the men almost entirely to the difference between the strata here and in Cornwall ?—Yes.

19,926. Is there any difference in the habits of the men ?—I think their habits here are good. I do not know what they have been in Cornwall for the last 25 years.

19,927. Did you work as a common miner in Cornwall ?—Yes, for 20 years.

19,928. Are the habits out of the mine of the Cornish miners and of the Welsh miners different ?—No, I should not think that there was a great deal of difference.

19,929. There is no such difference as to interfere with their health ?—No.

19,930. There is nothing in the habits of the Welshmen out of the mine which would conduce more to health than in the habits of the Cornishmen ?—No, I think not.

19,931. Are their lodgings as good here ?—I think that they are very good here.

19,932. Have they much garden ?—No, they are not at all like the Cornishmen for gardening.

19,933. They do not employ themselves so much as the Cornishmen ?—No, they are lazier people than the Cornishmen.

19,934. And yet they are a healthier class ?—Yes, but it is a healthy place ; the mines here are as healthy as they can be. As to sobriety, it is good; you know that it is improving everywhere, but here it is pretty good, with the exception of this town ; this town I think is very dissipated indeed.

19,935. (*Mr. Holland.*) What stone do you work in in your mine ?—Limestone. We have a great deal of the siliceous stone.

19,936. Chirt ?—Yes.

19,937. Is there any marked difference between the men who work in limestone and the men who work in chirt ?—Yes. I would rather do work in what is called the mountain limestone ; there certainly is better air in the mountain limestone or the carboniferous limestone ; ours is carboniferous limestone. There is better air in the compact mountain limestone or the carboniferous limestone than in the chirt or the shale. There is always some carbonic acid lurking about in the shale and in the chirt.

19,938. Are the men who work in the chirt decidedly less healthy than those who work in the limestone ?—We have not experienced that, but I should say that they would be ; we have not had sufficient experience to prove that.

The witness withdrew.

Mr. EDWARD WILLIAMS, of 4, King Street, Wrexham, examined.

E. Williams.

19,939. (*Chairman.*) What are the mines of which you have charge in this neighbourhood ?—The Park mines, the South Minera, and the Wynnstay Mining Company.

19,940. Do you know about the number of men in each of those mines working underground ?—In all there would be about 115 men ; the underground men would be, perhaps, about 95.

19,941. As to the Park mine, how many are there ?—About 45 men.

19,942. Are the workings in the Park mine connected throughout below ground, or are they worked separately ?—They are separate ; the eastern workings are separate from the western.

19,943. Do you use any artificial means of ventilation in any of these mines ?—We have a fan in the lower level which Mr. Kendall was down yesterday.

19,944. How is it worked ?—By two boys.

19,945. What is the extreme distance which you drive from any shaft or winze ?—We have a double

WREXHAM.
E. Williams.
15 July 1863.

level for nearly 200 yards from the shaft ; the current of air is through the lower one, and then there is room for it to pass over into another level. We have passed it, I think, from 80 to 100 yards, and our fan is placed about 30 yards on the shaft side of the ventilator.

19,946. Do you find that the carrying of the two levels by a division gives perfect ventilation ?—Yes, in the adit level it does so ; it will clear away the smoke of perhaps five or six blasts at the same time, in about three or four minutes.

19,947. Have the men any changing houses when they come to the surface ?—Yes, we have changing houses by all the shafts.

19,948. What quantity of candles are the men allowed ?—Generally speaking one set of 6 men take 12 lbs. every week.

19,949. What are they charged for the candles ?—About 6*d.* to 6½*d.* per pound ; they vary ; there is a small profit on them.

19,950. And for powder 6*d.* ?—Yes.

19,951.–Have you any doctor attached to your mine ?—Yes, Dr. Jones, of Ruabon; the men pay 6*d.* per month each to the doctor's fund.

19,952. Do you keep the account of the doctor ?—We keep the money.

19,953. The doctor is appointed by the adventurers ?—Yes, and he has his medicine and surgery on the mine, visiting the works every week.

19,954. Is there any accident club ?—No, we have been very free from accident.

19,955. The men do not pay anything as club money for accidents ?—No, we have only had three or four accidents within 16 years. One was a severe one ; a man lost his arm ; there has been no fatal accident.

19,956. Was the severe accident by blasting, or how ?—It was by the engine ; he got into the cog-wheel ; it was from his own carelessness ; he wore a long canvass coat, and it caught in the cog-wheel.

19,957. In the old workings do the men go down by ladders ?—Yes.

19,958. Do they go down the old workings principally, or any new workings ?—They go down the new workings and the old ; they go down the new shaft, and down to the deep level ; the shaft is 86 yards deep.

19,959. And they go by ladders ?—Yes.

19,960. (*Mr. Kendall.*) At present you are not doing much in the way of raising lead ?—No.

19,961. You are hampered by water ?—Yes.

19,962. By a large river which passes under ground in the Park mine ?—Yes.

19,963. What are you now doing in order to get rid of that water ?—We are driving a deep adit level.

19,964. How much deeper will that adit level come under the old workings ?—30 fathoms.

19,965. You have rich ore, but cannot follow it on account of the water ?—Yes ; the best ore lies about 4 feet wide.

19,966. How many fathoms will you drive before you cut the vein ?—We have to drive about 230 yards before we shall reach the average line of it.

19,967. How far have you gone at present ?—We are nearly 1,100 yards from the mouth of the adit.

19,968. Between the 1,100 yards and the adit end have you any shaft ?—Yes.

19,969. How far back from the adit end have you a shaft ?—A little more than 550 yards.

19,970. Are the men working in good air there now ?—Yes.

19,971. How was that effected ?—By means of a wall 2 feet of air-way is left by the side of the level.

19,972. What is the size of your level ?—At 7 feet 3 inches wide and 6½ feet high.

19,973. And you have a partition of what ?—Of stone and brick.

19,974. Is it air-tight ?—Yes.

19,975. You have a trap door near the shaft ?—Yes, the passage of the shaft is closed.

19,976. Then the air goes in from the adit end ?—Yes.

19,977. To the very end ?—Yes.

19,978. It comes round the division and up the shaft ?—Yes, the tramway is closed at the shaft : there is no way for it to get back again.

19,979. Is the air perfect in the end ?—Yes, quite.

19,980. How many men have you working in that end ?—12 ; they are now working 6 hours, three at a time in the end.

19,981. Is that as many as can work ?—No, we could put another man there.

19,982. Why do you not put another man there ?—We find that the 12 men drive just as much as the 16.

19,983. It is not on account of the air ?—No, it is from the room for working.

19,984. Do you find that sometimes there is a difference in the air in the end, that it is at one time better than another ?—Very seldom in that end ; the current is very strong.

19,985. Suppose you omit to carry up your division pretty close, do you not find a difference at once ?—Yes, no doubt of it, if it is left more than about 20 yards behind the end we find a difference ; we must not bring it too near the end or the current would be too strong. The men could not stop there, it would be too cold.

19,986. (*Mr. Holland.*) It would blow their lights out ?—Yes, and the blast would break down the wall.

19,987. Would it inconvenience them in any other way except in putting the lights out ?—Yes ; they would have to check it in some way, and the air would be very cold. We intended to put a donkey on the level to draw the stuff from the end, but we think that it would not live there ; that it would be too cold.

19,988. Have you observed a considerable difference between the health of the men who work in the chirt and the health of those who work in the limestone ?—In this district we have no chirt that they are working upon ; but in the Flintshire district there is a great difference. There is about ten years in the average age in favor of those who are working in the limestone.

19,989. To what do you attribute that great difference ?—We think that the dust of the stone is more injurious to the men.

19,990. Do you mean injurious to their lungs or in some other way ?—I do not know. The doctors will know that. It kills them sooner.

19,991. In what way does it injure them ?—In asthma ; they generally die of asthma.

19,992. The men working in the chirt are much more liable to asthma than the men working in the limestone ?—Yes.

19,993. That you are sure of ?—Yes, even in that district.

19,994. Is it due to the badness of the air at all ?—I do not know. I think that the dust would act in the same way without speaking of the ventilation.

19,995. Is there any difference in the quality of the air in mines in the two rocks, except the dustiness ? That I cannot tell.

19,996. Is there any difference in the air of which you are sensible ?—I cannot tell that.

19,997. Cannot you tell whether there is any difference in your sensation ?—I do not know that I can in those places. It is from the dustiness.

19,998. You are not aware of any difference ?—No.

19,999. Is the powder smoke very annoying ?—Very annoying.

20,000. Does it appear to injure the men ?—Yes, I fancy that it would.

20,001. Is it very important to get rid of it ?—It

would be, I think, a most important thing to get rid of it. In the case of men going into the powder smoke in the end the spit would be quite black for nearly the whole day afterwards; and the water which is thrown down upon the bottom of the shaft is very much discoloured, and it smells very bad.

20,002. That is the water which you use to wash the air. Yes; the water which is thrown down after the blasts have been made. We have a little stream which is dammed up in the cross-cut, it rises about a foot and a half in the floor of the level, while the men are sinking in the bottom. When they put their blasts out, the tap is taken out and the water goes down. When that water comes up it is black.

20,003. How long is it before the smoke is cleared away by that water?—It is a very short time; perhaps about ten minutes.

20,004. (*Mr. Kendall.*) From your experience can you state what the difference would be between the time in which the smoke would be cleared without water and with water?—It would be there for hours without water; in fact it would not clear away for the whole day after putting one blast there.

20,005. (*Mr. Holland.*) Have you seen cases in which men have suffered very much from cold after coming out of the mines?—Yes, when the weather on the surface is very cold, and the exertion on coming out of the mine is very great, particularly in the case of old miners.

20,006 Have you seen their clothes freeze on them?—Yes, at the new shaft which you saw yesterday. I have seen the men come up and their clothes actually freeze on them before they could reach the cabin.

20,007. (*Mr. Leveson Gower.*) Is the system of ventilation by a partition adopted in any other works that you know of?—I do not know any other case except in this level.

20,008. (*Mr. Kendall.*) What induced you to adopt it?—It has been done for the last 50 years.

20,009. Where?—In this very level.

20,010. Do you think that you shall be able to carry out the whole length in the same way?—Yes, I believe that we could go on for two or three miles if we wished.

20,011. (*Chairman.*) Do you think that in all mines where the men have to go by ladders it would be an improvement if they could have cages to go up and down?—Decidedly a very great improvement. We lose the labour of the best miners, that is to say the old tributers, in deep mines. They cannot go up and down the same the a young man, and generally speaking in the end of our own mine the old men have had to leave their work about an hour before the others, and then the young men, perhaps, would get up with them before they reached the top again.

20,012. (*Mr. Holland.*) What loss of effective power is there from climbing up and down say 200 yards?—I am sure that it is equal to half the stem of work for old men, and one fourth for young men; they would feel themselves more at their ease at their work if they did not climb, as they are used to their work.

20,013. (*Chairman.*) Do you know any case where men have lost their lives in air where the candle has been found to burn?—Yes, in the Bryngwyn Mine, near Mold, six men lost their lives, and the candle was found burning within about ten yards of the men.

20,014. (*Mr. Kendall.*) Were the men nearer the end than the candles?—Yes, they were between the end and the candles.

20,015. (*Mr. St. Aubyn.*) What did those men die from?—I do not remember what the verdict was, although I have read it; they were suffocated.

20,016. This is only what you have heard?—Yes. The coroner at Mold could give the particulars.

The witness withdrew.

Captain SAMPSON MICHELL, of Park Mine, Minera, examined.

20,017. (*Chairman.*) You are underground agent at the Park and South Minera Mines?—Yes.

20,018. How many men have you?—115.

20,019. How many underground?—About 100 altogether, spread over the mountain in different parts.

20,020. These mines are not all connected underground?—No, they are not.

20,021. They are separate workings?—Yes.

20,022. What is the deepest working?—The Park is 190 yards.

20,023. Have you on any occasion found the air bad, so that you are obliged to use artificial means?—Yes.

20,024. How do you judge when the air is bad?—We generally find it by the deadness of the candles burning, and its affecting any person who is in it.

20,025. Is that the only means by which you judge of it?—Yes, and the powder smoke lying so that the men caanot get on with their work so well.

20,026. How long does the powder smoke remain in any place where you consider the ventilation deficient?—From an hour to an hour and a half.

20,027. And how long where it is good ventilation?—It goes off in about two or three minutes where the ventilation is very good.

20,028. How far would you drive from any winze or shaft without any artificial means of ventilation?—We drive from 160 to 200 yards; we have done that without artificial means.

20,029. What is the artificial means which you would use in that case?—A fan, a duck machine, a water fall or partition wall.

20,030. In any of the smaller mines do you find any difference in the ventilation from the larger mines?—The deeper the mines are the worse the ventilation is.

20,031. Does not it depend upon the distance from any means of ventilation?—It rather depends upon the distance, but the deeper we go down the warmer it gets.

20,032. (*Mr. Kendall.*) You do not doubt, as I understand you, that if you carry on the division and make it air tight, you will be able to go through the whole length?—Yes.

20,033. What will be the whole length before you cut the vein?—About 230 yards additional to what is already done.

20,034. You think that you will have sufficient draught by this division without any artificial means?—Yes, if we keep it air tight.

20,035. (*Chairman.*) Is the draught of the current of air always the same way along the two divisions?—I have found it different.

20,036. Is it, do you think, affected by the weather?—I fancy that it is.

20,037. Is there a period when it is more stagnant than at other times?—It is a little in warm weather.

20,038. Whether it be a downcast or an upcast, is the air in the end very good?—Yes.

20,039. (*Mr. Holland.*) Does the direction of the wind affect the current?—Yes, it does.

20,040. Have you noticed that with any regularity?—I have not taken particular notice of it, but I should fancy that it would; that when the wind is east it would be more likely to go in at the mouth of the level.

20,041. The adit points east?—Yes, and it comes out at the top of the shaft.

20,042. Does hot weather alter it?—Yes, a little.

20,043. Does it ever make it stagnant?—No, I do not know that it makes it bad at all in this level, but it alters it in the workings on the hill. I have heard no complaint from the men in that level as to the badness of the air.

WREXHAM.

Capt. S. Michell.

15 July 1863.

20,044. (*Chairman.*) Do the men always complain to you if the air is bad ?—They do mostly if it is so.

20,045. But they will work on sometimes without doing so ?—Yes, they will work their contract through.

20,046. Even although they find the air a little poor ?—Yes.

20,047. (*Mr. Leveson Gower.*) Have you ever known the air bad and the candles not affected in the burning ?—No, I do not remember that I have.

20,048. The minute the air is bad the candles burn differently ?—Yes, and they are obliged to put them on one side.

The witness withdrew.

Mr. THOMAS TAYLOR GRIFFITH, of Wrexham, examined.

Mr. T. T. Griffith.

20,049. (*Chairman.*) You are a surgeon ?—Yes, consulting surgeon.

20,050. In the course of your experience have you ever met with cases of men suffering from miners' disease ?—Yes, some years ago I was more in the habit of seeing the miners frequently and constantly ; at one time I attended pretty nearly all the mines in this district and therefore the diseases which did occur fell very much under my observation.

20,051. Amongst them what was the principal disease ?—Asthma. That was a kind of generic term, which included many pulmonary diseases, bronchitis, and diseases of the heart and obstruction in the lungs ; but there was nothing very peculiar : the same diseases might have been produced very much under any circumstances which were favorable to them. The complaint which was most specially connected with mines certainly was lead colic.

20,052. Did you find that with men working underground ?—No, it was chiefly with men who were obliged to reside within the atmosphere of the smelting houses ; there were three at that time.

20,053. And they suffered ?—Yes, especially.

20,054. As regarded men working as miners underground, you do not think that there was any special affection ?—Probably there were dispositions created from circumstances. I should say especially that I think that posture contributed very much to the younger men being affected.

20,055. Do you think that that tended to shorter life among them ?—Certainly, as a cause. I am speaking of 30 years ago ; the miners were then short lived.

20,056. Have you any experience now ?—No, I have none which could enable me to speak to that point.

20,057. You do not attend any miners ?—No, I have not done so for the last few years.

20,058. (*Sir P. Grey Egerton.*) How does the disease which you call miner's asthma generally commence in this country; by bronchitis ?—Yes ; and then it depended upon family disposition or individual peculiarities as to its further progress. If there was a family tendency to consumption the bronchitis very often degenerated into consumption. A man might be very delicate or a very drunken man ; that modified the ultimate effects of the disease.

20,059. Do you find, in fact, that miners' asthma often degenerates into true phthisis ?—No ; I do not think that miners were very much disposed to that termination of asthma ; as it seemed to be more connected with and more liable to bring on heart disease than consumption.

20,060. In cases of miner's asthma, do the miners themselves attribute it to catching cold or to being exposed to dust or bad air ?—Bad air. I think that there are three circumstances which make miners, especially the younger miners, susceptible of bronchial disease—one is certainly the position.

20,061. You mean stooping ?—The cramped up posture, working in a gallery only about three feet any way, so that they must accommodate their position to the nature of the work ; they have no choice —that is one thing.

20,062. Then in addition to the deleterious air, the position is such as to prevent the free action of the lungs ?—Yes, and the diaphragm.

20,063. And the respiratory organs ?—Yes.

20,064. What is the next stage in the progress of the disease ?—Supposing a man begins with what may be called asthma, that is to say, supposing he suffers from difficulty of breathing, that perhaps passes off ; it is only whilst he is in the mine. It is not that they are liable here so much to any special noxious gases which have a name, it is rather a negative state, the absence of fresh air, from lights burning, and from a number of men destroying the oxygen of the atmosphere ; it does not arise, as in the coal mines, from chemical changes naturally existing, but from accidental circumstances ; perhaps the place may be a confined gallery with lights constantly burning, and a number of men working, inhaling the fresher air and expelling a quantity of deleterous air with carbonic acid gas ; and then certainly what does affect all miners is the absence of sun and sunlight.

20,065. Do you think that the exertion of going up ladders has any effect upon the miner's health ?—It may do so, but I cannot say ; here it has not been very great ; they are not obliged to go quickly, and very often here the ladders are assisted by ropes and chains down a shaft.

20,066. At what period of the disease do you find the complication of heart disease supervening ?—What are called their stems here are long, very often 12 hours. I have since learnt that stems in the mine are only of 8 hours continuance. But in most collieries they are all 12 hours long. A man struggles with it, and, perhaps, he is unwilling to apply or does not apply for medical relief till there is some form of bronchitis established, such as chronic bronchitis, and constant difficulty of breathing, and an obstruction in the air passages or bronchial tubes. The heart, to keep up the due relation between its own action and the transmission of the blood through the lungs, has to labour to overcome obstructions ; that leads, in some cases, to a thickening of the walls of the heart, or to an over action and attenuation and thinning, or, perhaps, both at once.

20,067. Or valvular diseases ?—Valvular diseases sometimes come on, if there is anything in the person's constitution leading to a deposit about the valves, but it does not necessarily follow ; it may be and frequently is a disease connected with it.

20,068. Did you ever see black spit in this district ?—I never saw it in a miner.

20,069. In case of death, what is the condition of the lungs after death ?—I have had no opportunity of judging, owing to the prejudice here against post mortem examination ; it is only very lately that a post mortem examination could ever be obtained, unless there was reason to state to the jury that there had been a want of proper treatment, or unless there was something upon a post mortem examination to necessitate a coroner's inquest; such a thing never occurred within my own experience.

20,070. But by a stethoscopic examination you have been able to form an idea ?—Yes.

20,071. What is your opinion ?—The stethoscope is a more recent instrument, and in my early practice it was very little used ; it is a thing of only 40 years existence in this country.

20,072. In your opinion is the result the hepatization of the lung or emphysema, or what ?—Emphysema. I should say very often bronchitis, and then chronic bronchitis with a permanent cough and emphysema. It depends on the state of the man ; if he happens to have in addition to bronchitis an attack of pneumonia, then that is followed by hepatization and consolidation of the lungs. If there is pleurisy, then there is effusion, and any or all of them may lead to chronic disease of the heart.

20,073. From your great experience in this district,

what should you suggest as the best remedial measure for the miner?—First of all, shorter periods of continuance in the atmosphere of the mine. To be 12 hours in an atmosphere very much deprived of its oxygen, with no sunlight, and breathing an air, formed in some measure by the combustion of candles, must be injurious. Then there should be as much dryness as possible; that is very often quite unattended to, and there is a trickling of water, and if a man is not inconvenienced by it, very little attention is paid to it. When the temperature is at all increased, a good deal of evaporation must go on, so that very often they are breathing a damp atmosphere loaded with an undue proportion of carbonic acid gas. I should say that the remedy would be dryness, shorter stems, and, above all things, ventilation.

20,074. (*Mr. Leveson Gower.*) Do you think that the health of the miners is inferior to that of the agricultural labourers?—Decidedly. When I was acquainted with them—(I could not speak statistically)—I should think that the average of 45 years was a longish life for a miner.

20,075. (*Mr. Holland.*) Are miners unusually liable to rheumatism?—Yes.

20,076. Much more than other men?—Yes, they are liable to it. With this class of men, unless you investigate their complaints, or they produce an inconvenience, you hear but little of them. But if you took 20 miners walking into this room, and asked them, you would find that most of them were subject to more or less rheumatism, but they would never think of mentioning it.

20,077. Is that rhematism chronic rheumatism?—Yes; I cannot recal many cases of acute rheumatism.

20,078. You attribute their pulmonary diseases to several causes; you mentioned bad air and inconvenient position?—Yes.

20,079. And what others?—The absence of sunlight for 12 hours, that is half of a man's life. Six months of a year that man passes in an artificial condition.

20,080. Is the dust of the mines likely to cause a pulmonary disease?—To a certain degree, from the chipping off of the stone, and the currents of air keeping the finer particles suspended.

20,081. Do you think that the powder smoke is a cause of that disease?—Where powder is used undoubtedly the combustion would assist in destroying the oxygen of the atmosphere.

20,082. The mines are stated to be much warmer than the outer air?—Yes.

20,083. Is the constant change from warm to cold air prejudicial?—Generally speaking; and no doubt miners bronchitis is very often produced by it.

20,084. By the alterations of temperature?—Yes. A man works below in a higher temperature; he comes up thinly clad, whatever the temperature may be at the pit's mouth. It may be in March; it may be snowing or raining; he retires to a small cabin and puts on some clothes, and then makes his way perhaps over the side of a hill for half or three-quarters of a mile.

20,085. I think you said that all men are liable to disease but miners in a particular degree?—Yes, all men are liable to take disease from variations of the atmosphere and so on.

20,086. But miners are liable to the same thing in a much greater degree?—More frequently in a greater degree.

20,087. Are miners as a class very much more liable to pulmonary disease than other men?—I should not say so.

20,088. You have attended colliers as well as miners?—Yes.

20,089. Is there a marked difference in the condition of those two sets of men?—Certainly. I should say that there is a greater tendency in colliers to pulmonary disease, and that they are not so liable to have heart disease with it; from family dispositions it more frequently ends in phthisis than with the miners. The miner's death is very often caused by obstruction within the chest, either through the lungs or through the openings of the heart, producing œdema in the legs, and hydro-thorax. If you enumerated the causes producing death in a certain number of miners and in the same number of colliers, I should say that you would certainly have a larger proportion of men among colliers dying of some form of consumption, and with the miners the largest proportion would be those dying from disease of the heart and dropsy of the chest.

20,090. Which class of men lives the best at home?—I think the miner; because he is more regular in his habits of living; he is more temperate; he has a better house; he has more cleanly habits; he is a better conditioned man, and therefore eats and drinks under other circumstances; he is not often drunk. The collier will only work five days in the week, and will drink for the remainder of the time; or he will perhaps devote Friday, Saturday, Sunday, and Monday to regular drinking: he makes no secret of it.

20,091. Is that very rare among miners?—Very rare; as far as my own personal recollection goes, I think that it is a thing almost unknown. You may have had of course a drunken miner now and then; but he was distinguished; he was known.

20,092. Are not colliers much more liberally paid than miners?—I do not know; but they are more regularly paid.

20,093. But notwithstanding the less regularity of payment of the miners they are more regular in their living?—Yes, and they are more provident men.

20,094. Notwithstanding that greater regularity of living, are they more unhealthy?—I should say that their complaints formerly had a more fatal character than with colliers.

20,095. They were shorter lived?—Yes.

20,096. There is no doubt about that fact?—Not in my own experience.

The witness withdrew.

Mr. EDWARD WILLIAMS, M.D. surgeon, of Wrexham, examined.

Mr. E. Williams, M.D.

20,097. (*Chairman.*) You have no cases of miners' disease under your attention?—I have not any, and I have come here in obedience to the wishes of the chairman; but I have so little to say, that I really hardly know how to begin to say it. I have no mining cases under my hands at all now.

20,098. But you know of the fact of the men suffering in mines?—Yes, that is very common,

20,099. Do they not apply to you?—Very seldom indeed. I do not recollect that I ever attended them for the miners' asthma.

20,100. Why do you think that they do not apply?—Because I think that they look upon it as part and parcel of their business. A man embarks as a miner, and he looks forward to the day when he will have this disease; he expects it,—he reconciles himself to it,—and puts up with it; and I think that he does not seek any advice from, perhaps, the misfortune that we cannot give him much assistance. It is a thing which goes on—he has other complaints—perhaps he may be laid up with a fever or with some other complaint, and then of course an enquiry is made into all the circumstances connected with his case, and we discover that he is labouring also under the miners' asthma. I never recollect being called in particularly to a case of miners' asthma.

20,101. But you have met with it in the course of your practice?—Yes, very often. The men think that there is no remedy; it is a thing which they think that they have to submit to, and they submit to it with the best grace they can, and they drag on their existence as well as they can.

20,102. And you think that it tends to shorten life?—Certainly.

WREXHAM.

Mr. E. Williams, M.D.

15 July 1863.

20,103. Do you think that it is general amongst miners?—It is very general amongst the miners working in lead mines.

20,104. (*Mr. Holland.*) At about what age do they get it?—That question I cannot answer.

20,105. (*Mr. Leveson Gower.*) Has there been any improvement with regard to the health of the miners within the last ten years?—I cannot speak to that, my experience with them was some years ago. I used then to come into contact with them much more frequently than I do now.

20,106. Can you state their average ages?—No, I have no statistics, but we always look upon them as a short-lived race of men.

20,107. (*Sir P. Grey Egerton.*) Are the cottages of the miners tolerably comfortable and healthy?—A great many of them live in their own dwellings, and are so.

20,108. Freehold?—Freehold, in some cases I think, and speaking generally, a great many of them are tolerably clean, and being on the side of the hills which we have up at Minera, I should say that they are generally speaking pretty well ventilated. Taking them as a class of people, I should say that they are quite as well off in their dwellings as their neighbours under the same circumstances. I should say that they are better off than the colliers.

20,109. What is your opinion of the general hygiene of the miners' families; are the families, generally speaking, a healthy race?—I should not hold them up as special examples of healthy people.

20,110. Are they as healthy as the agricultural population of the district?—No, I should say not.

20,111. To what cause do you attribute that?—I do not know that I can attribute it to any one cause specially. I cannot say that they inherit it, though possibly they may do so; but it is the impression on my mind that they are not such healthy people as the agriculturists.

20,112. Cannot you trace that to any cause, either to the habitations or to the habits of the people?—Not absolutely, though in many cases these doubtless have their influence.

20,113. I speak entirely of the families of the miners, the women and children?—I could not say that there was anything to which I could trace delicacy, but the numerous accidents incident to mining and the consequent loss of wages of the family, is a fertile source of poverty and privation, which of course must tell injuriously upon the health and vigour of their children.

The witness withdrew.

Mr. EDWARD DAVIES, surgeon, of Wrexham, examined.

Mr. E. Davies.

20,114. (*Chairman.*) I believe that you attend the different mines in the neighbourhood?—I do, more than other medical men here.

20,115. Will you state some of the principal mines?—There is the Minera mine, and there is the Union; those are the chief; there are several other smaller mines.

20,116. How are the doctors appointed to those mines?—Originally at the large mine the medical man was appointed by the company, but it seemed to give so much dissatisfaction to the men, that the directors left it to the men to select their own medical man, and to make their own terms with him.

20,117. Do the men pay so much?—they pay so much a month.

20,118. Do they pay it to the adventurers or to the managers of the mine, or to whom?—The carpenter receives the money; he is a man who has had a little education, and they pay it to him.

20,119. So that it is in fact quite an independent club?—It is quite independent of the masters or directors, or anything.

20,120. How long has that system been adopted? I have had it between five and six years, and I believe that that form of medical club was in existence for three or four years before.

20,121. What is the amount which the men pay?—6*d.* each a month.

20,122. Is that for themselves?—For themselves and wives, except in midwifery cases.

20,123. (*Mr. Holland.*) Does it include their families?—No, only the husbands and wives.

20,124. (*Chairman.*) In case of any accident is there any extra payment?—None whatever.

20,125. (*Mr. Holland.*) That is for both sickness and hurt?—Yes.

20,126. (*Chairman.*) Since you have been in this neighbourhood as medical man attending the mines, have you had any cases under your notice of what is called miner's disease?—I do not know exactly what that term would mean, but I have never found any disease peculiar to miners.

20,127. You have observed no particular affection of the bronchial tubes?—No. I have done so in coal miners, but not in lead miners.

20,128. Have you never found any of their respiratory organs particulary affected?—No, not more than I find in the ordinary agricultural districts.

20,129. Should you say that this is, speaking generally, a healthy district as regards consumption or any of that class of diseases?—No; there is a good deal of chest disease in this country, and it seems to be more prevalent in the mountainous parts than in the flat part of the neighbourhood.

20,130. Do you attribute that to any particular cause?—No, only to the great change in the weather more than anything else.

20,131. (*Mr. Holland.*) Alternations of temperature?—Yes, sudden changes.

20,132. (*Chairman.*) With regard to the houses, are the men well lodged, generally speaking?—The miners' houses round Minera are generally good houses, comparatively.

20,133. Are you subject to any epidemic fever?—There has been a good deal of fever among children, typhoid fever and scarlet fever, but no fever peculiar or prevalent among the miners themselves.

20,134. Then on the whole you would say that they were a very healthy class?—I should consider them very healthy.

20,135. And as long lived as others?—Yes, I think, equally so.

20,136. (*Mr. Holland.*) Do you say confidently that there is no excess of pulmonary disease among the mining population?—Yes. Since my attention has been drawn to this matter, I have taken particular notice.

20,137. There is no greater amount of bronchitis among them than among the ordinary population?—Just so.

20,138. You say that there is an excess of pulmonary disease generally in the district?—Yes.

20,139. And you attribute that to alternations of temperature?—I do not know to what other cause to attribute it.

20,140. Are not miners exposed to more frequent alternations of temperature than ordinary labourers whom you visit, the work being hotter?—I do not know much about the interior of the mines, and therefore I can hardly speak about that.

20,141. Have you ever noticed miners when they come up from the mines?—Not particularly.

20,142. Do you know that it is common for miners to be in a state of profuse perspiration when they come up from the mines?—I have never noticed it, but very likely it is so.

20,143. Are the miners in this part of the country in bleak situations frequently?—There are some of them sheltered between hills, or little rocks or mountains in the valley part, but most of them are in exposed situations:

20,144. Have not the miners frequently to go con-

siderable distances home from the mines?—Most of them in Minera; many live in the immediate neighbourhood; some live four or five miles off, but there are very few who do not live in the immediate neighbourhood.

20,145. If miners get hot at their work and have to go in bleak situations to their homes, it must predispose them to pulmonary diseases?—Yes, in some measure.

20,146. But you do not think that those diseases are more frequent with them than among the rest of the population?—My attention has not been particularly called to the fact of there being more chest disease among miners.

20,147. Are not they much more exposed than the rest of the population to breathing dusty air?—Yes, I should say so, from the nature of their occupation.

20,148. Is not that likely to produce pulmonary disease?—Yes.

20,149. Miners are exposed to a great deal of hard work in climbing?—Yes.

20,150. They are apt to be heated by that exertion?—Yes.

20,151. And they have then to go home long distances in very exposed situations?—Yes; of course it would to a certain extent predispose them to those diseases, but this is only supposition; their occupation is laborious, and the exertion of getting up to a certain height must make them warm, but I am not aware that they are so.

20,152. If the population generally are peculiarly liable to pulmonary complaint from the alternations of temperature, and if the miners are more exposed to those alternations of temperature than the rest of the population are not the miners more liable to pulmonary disease?—Yes, it would seem so.

20,153. After that, do you still adhere to the opinion which you have expressed?—Yes.

20,154. (*Mr. Kendall.*) Notwithstanding all these probabilities which you have heard of, yet you feel certain from your practice that the miners are as healthy as the agriculturists?—Yes, they are.

20,155. And that the miners' children are as healthy as agriculturist's children?—Yes, they are.

20,156. Before having to do with the mines, had you much to do with the agricultural population in those districts?—I have had to do with it sometimes. The miners country is very populous; the agricultural districts are not so.

20,157. Do you go over as much of the area of the agricultural districts as of the mining districts?—I travel a great number of miles in the agricultural part, but the districts are not so populous.

WREXHAM.
Mr. E. Davies.
15 July 1863.

20,158. Take the relative number of cases which you attend, is it two miners and one agriculturist?—For one agriculturist I attend six miners.

20,159. In this district, did you attend the agriculturists before you took to the miners?—No; my practice commenced chiefly in the mining district.

20,160. How many years have you been in practice?—I have been in practice in this neighbourhood six years next August.

20,161. Before you came here did you attend any miners anywhere?—I attended them in this neighbourhood before I came to reside here permanently.

20,162. At that time had you a good deal of agricultural practice as well as with miners?—No; nearly every medical man has more to do in the mining districts, because they are far more numerous.

20,163. Was the district in which you first started a mining district?—Yes, in the neighbourhood of Minera.

20,164. Then the whole of your practice has been amongst miners?—Yes.

20,165. But as far as it has gone among miners and among agriculturists, do you find the health of the one as good as the health of the other?—Just the same.

20,166. (*Mr. St. Aubyn.*) You mean to state generally that as far as your experience goes, the miners are not liable to any particular complaint arising from their calling?—I cannot name one. I have thought over everything since the question was put to me, and I cannot call to mind one.

20,167. (*Mr. Leveson Gower.*) Do the miners continue working in the mines to as late an age as labourers in the agricultural districts work in the fields?—There are several old men, but not very many. I cannot call to mind very many old lead miners. I can bring to mind several old coal miners, but not lead miners. I know one of 74 now working in a coal mine.

20,168. To what age do miners generally live?—A little over 50; from 50 to 60.

20,169. You have no statistics as to that?—I have not.

20,170. (*Mr. Holland.*) Do miners of 50 look as young as agricultural labourers of the same age?—Some of them look equally well.

20,171. I mean as a class?—Not meeting with an equal number on each side, I can hardly contrast them; the agricultural district here is comparatively very thinly populated.

The witness withdrew.

Adjourned to To-morrow, at Mold.

MOLD.

Thursday, 16th July 1863.

PRESENT:

The Right Hon. Lord KINNAIRD, K.T.	NICHOLAS KENDALL, Esq., M.P.
Sir P. GREY EGERTON, Bart., M.P.	JOHN ST. AUBYN, Esq., M.P.
The Honourable E. F. LEVESON GOWER, M.P.	P. H. HOLLAND, Esq.

The Right Honourable Lord KINNAIRD, K.T., in the Chair.

Captain JOHN FLOYD, of Westminster Mine, near Mold, examined.

MOLD.
Capt. J. Floyd.
16 July 1863.

20,172. (*Chairman.*) You have charge of the Westminster Mine?—Yes

20,173. Have you charge of any other mines?—None particularly; a small mine or two, but nothing to signify. I just go there now and then.

20,174. Of what description is the ore in the Westminster Mine?—Lead ore.

20,175. How many men have you working underground?—We have 48 now; we have 50 sometimes.

20,176. What is your lowest level?—Taking the lowest level, reckoning the engine shaft and altogether, it is 120 fathoms from the surface.

20,177. How long have you had charge of the mine?—I have been 20 years in the mine.

20,178. Are you a Cornish man?—Yes.

20,179. From what district of Cornwall did you come?—The western part; from Marazion to Hayle.

20,180. Did you work in the mines there?—Yes.

MOLD.
Capt. J. Floyd.
16 July 1863.

20,181. How do the men ascend and descend ?—By ladders.

20,182. How do you draw ?—By the wem engine.

20,183. With a skip ?—No ; with kibbles.

20,184. Have you steam power ?—Yes.

20,185. How many shafts have you ?—We have two principal shafts, but we have small ladder road shafts as well.

20,186. But you have two principal shafts to the day ?—Yes, one east and the other west.

20,187. Are they connected below ?—Yes.

20,188. What is the principal level which you are now working at ?—It is 64 fathoms from the surface.

20,189. Have the men any place to change when they come to the surface ?—Yes, they have a cabin prepared for them with steam pipes in it to warm it.

20,190. Have they any warm water ?—Yes, there is warm water condensing from the engine.

20,191. Do the miners reside near the mine ?—Yes, within two or three miles.

20,192. What allowance of candles have they per week ?—2 lbs. for each man.

20,193. What is the price charged ?—8*d.* a lb. we charge the miners.

20,194. And the same for powder ?—Yes.

20,195. Is there any deduction for club ?—No ; we have no club now ; we had a club until within the last 12 months.

20,196. Is there any subscription for doctor ?—Yes.

20,197. Is the doctor appointed by the adventurers ?—By the adventurers and the miners. The miners pay 6*d.* per month each man.

20,198. Who has the choice of the doctor ?—He is chosen by the men.

20,199. How is it managed ?—It goes by vote. We let them elect their own doctor.

20,200. Have you done that for some time ?—Yes, three years ago.

20,201. Did you make any change for any reason ?—We made a change. One doctor that we had before lived in Mold, and the doctor that we have now lives at Ruthin. The men were dissatisfied that the doctor living in Mold did not attend regularly, and they wished to change, and we let them choose their own doctor.

20,202. Do you keep a month in hand of the pay ?—Yes.

20,203. Do you pay in notes or in small change ?—In gold and silver.

20,204. Do you know of any men suffering from working in mines ?—There are a few old miners who have been working underground all their days who suffer a little, more or less.

20,205. You yourself have suffered ?—Yes.

20,206. Where were you working when you were affected ?—I worked some years before I had the management of mines in the mines in Flintshire, and I think that I am suffering from that.

20,207. You think that it was brought on by working ?—Yes, in the lead ore.

20,208. What do you think it was occasioned by ?—I do not know, excepting it was from the dust from the lead ore.

20,209. Do you think that it was from working in bad air ?—Yes. I have been working in bad air, and whether it has had some effect or not I do not know.

20,210. (*Mr. Leveson Gower.*) Do you consider the air better now than it was when you were working ?—When I was working myself I was working in Flintshire. It is not the same mine. Our mine is now in Denbighshire.

20,211. Do you consider your mine better ventilated than it was ?—It is very good air.

20,212. It is better air than where you worked ?—Yes.

20,213. At what age do the miners generally leave off work ?—We have some miners of 60 or 70 years of age working now. They generally leave off working at from 60 to 70.

20,214. (*Mr. St. Aubyn.*) You have had some experience in Cornish mines ?—Yes ; I worked a little there when I was young.

20,215. Comparing these mines with the Cornish mines should you say that they were more or less healthy ?—I think that these mines are worked on just the same system as the Cornish mines.

20,216. But with regard to ventilation how is it ?—I think that the ventilation is quite as good here as there.

20,217. With regard to the health of the men working in the mines do you think that they complain more or less here than they do in Cornwall ?—I think that they complain less here than they do in Cornwall.

20,218. Is there less of what you call the miners' disease here than in Cornwall ?—Yes, I think there is.

20,219. When did you leave off working in Cornwall ?—I was 18 years of age when I left Cornwall ; that is about 35 years ago.

20,220. The mines are not so deep here ?—No, not by a great deal ; some of the mines in Cornwall are very deep.

20,221. The men invariably ascend by the footways here ?—Yes, except in the coal mines ; in the coal mines the men go up and down in buckets and skips.

20,222. Do you think that it would be an advantage for the men if they were brought up in skips ?—I do not know ; as the mines are now worked I think that it would be of very little advantage where they work in different levels.

20,223. You do not think that the climbing is injurious to them ?—No, because they are working in different levels ; if the men all worked in the bottom of a deep shaft I think that skips would be advantageous.

20,224. Do you go much underground yourself now ?—Yes.

20,225. To what depth do you go ?—The bottom is about 120 fathoms from the surface.

20,226. Do you feel any inconvenience result from climbing ?—Yes, compared with what I did when I was younger.

20,227. If you could come up by any other means than by the footways you would not feel the same amount of inconvenience ?—No.

20,228. Therefore, in your opinion, it would be a good thing to have some other method of ascending ?—It would be an advantage to come up by skip instead of climbing.

20,229. Has that ever been suggested here ?—I do not know that it has, because no mines are worked to a great depth here excepting such as the old Minera Mine ; the mines generally in this neighbourhood are rather shallow.

20,230. You do not consider that a depth of 100 fathoms is so great as to induce the managers to bring the men up in skips rather than by the footways ?—To bring them up by skip a plim shaft would be more convenient and the shafts here generally go down with an underlay according to the vein.

20,231. But skips can be used in a diagonal shaft ?—Yes.

25,232. (*Mr. Kendall.*) What is the deepest mine in which you ever worked in Cornwall ?—I should think about 100 fathoms.

20,233. Whereabouts was that ?—In the parish of St. Hilary.

20,234. What was the mine called ?—Old Bertha Croft.

20,235. You never worked in Cornwall deeper than 100 fathoms ?—No.

20,236. Have you worked at 100 fathoms here also ?—Yes.

20,237. Do you find any difference at that depth here and in Cornwall ?—I think it is rather warmer in Cornwall ; I think it is cooler here.

20,238. You would rather work at 100 fathoms here than in Cornwall ?—Yes.

20,239. You think that you suffer less ?—Yes.

20,240. Do you think that there is less dust here?—I do not think there is.

20,241. You say that you cannot go up and down as well as you could; does that arise from your being an older man than you were some years ago or from any other cause?—I am certainly older than I was then and I have worked very hard and a good deal in mines, which perhaps has affected my lungs, so that I cannot climb now as I could then.

20,242. You think that it is partly from age and partly from the work?—Yes.

20,243. I observe that you have 50 men engaged here in picking ore; is that so?—No.

20,244. How many men have you?—50 altogether, that is driving and sinking and picking ore.

20,245. How many men have you picking ore?—In the dead bargains they are picking a little ore; we are getting a little ore in most of the places that we are working in.

20,246. Are you picking ore on the surface?—A little in waste washes and the hillocks.

20,247. (*Chairman.*) Is it in old workings that your men are principally employed?—No; we are extending our levels and sinking in new ground; there are 50 men altogether employed in picking in the old workings and engaged in the new ground.

20,248. (*Mr. Kendall.*) How do the men pick; is it by day work?—So much a ton.

20,249. Have they any shelter?—Yes, in wet weather; they do not require it otherwise, because they are working perhaps two or three hours in one place and three or four hours in another, where they can get a bit of ore.

20,250. Do they pick over all the old workings?—All the old hillocks.

20,251. How many men and boys have you upon the surface picking the old workings?—Two men and five or six boys.

20,252. What end where you are now working is farthest off any shaft?—We have rises and stopes working.

20,253. Have you any ends at all?—We have only one end which is carried on as a dead bargain, and that is not more than three yards from a shaft.

20,254. Where is your rise?—Sixty-two fathoms from the surface.

20,255. How far is your rise from any shaft?—About 35 fathoms.

20,256. Thirty-five fathoms in from the shaft you have a rise?—Yes; there are two shafts and there is a rise in the middle, and they have a thoroughfare of air from one shaft to the other.

20,257. How many men have you there?—We have ten men stoping in that rise.

20,258. Is it a rich part there?—Not very rich; the vein is large and it is worthy of trying.

20,259. Have you any close end where you are obliged to use a fan?—No, not at present.

20,260. Have you any end where the candles burn dull?—No; the candles burn well everywhere.

20,261. You say "not at present;" have you ever had such an end in the last twelve months?—No, not in the last twelve months.

20,262. In the last two years?—Yes.

20,263. Where was it; in what level?—It would be about 90 fathoms from the surface.

20,264. How far off from a shaft was it?—That end was continued, but we have had rises from there up to another level.

20,265. When the air was bad how far off was it from any shaft; I mean before you holed?—Before we holed it was 50 fathoms from a shaft, then we sank and rose to meet and then we had plenty of air, but before that the air was flat.

20,266. Before you holed was the air bad both in sinking and in rising?—Before holed the air was rather dead.

20,267. In the deadest time, how many men could you put there?—It only requires two men in the 8 hours each piece, 6 men in 24 hours.

20,268. Had you six men altogether?—We had two men working there and two men in the roof working eight hours, and when the air was very flat we only put them six hours.

20,269. Was the air ever so bad that they could not work six hours?—No.

20,270. Were the candles ever dull there?—The candles always burn dull when the air is flat.

20,271. Did you use any fan at all?—Yes.

20,272. Did that give you a good supply of air?—Yes, there was plenty of air.

20,273. (*Sir P. Grey Egerton.*) What age were you when your health gave way?—I do not know; my health has been failing for the last 20 years. I was abroad in North America for two years, in North Carolina, looking at the mines there, and I think that it injured my health very much; it was very hot there.

20,274. You suffered, you say, from lung disease?—Yes.

20,275. Had you any black spit?—Yes, when I was working, but not now.

20,276. What was the first commencement of your illness; did it begin with catching cold?—I was continually catching cold.

20,277. And then you got worse and worse?—Then I got feebler and feebler.

20,278. Had you any pain across your chest?—No.

20,279. Had you shortness of breathing?—Yes.

20,280. Did you find those symptoms aggravated when you were working in dead air?—Yes.

20,281. Do you think that dust and powder smoke had anything to do with your illness?—I think that dust had a good deal.

20,282. Then it might be the effect of the dust?—Yes.

20,283. Do you think that the powder smoke affected you at all?—I do not think that it did in the commencement at all, but in later years I think that it did.

20,284. Had you any palpitation of the heart?—I suffered a good deal from it some time ago, but I do not now; that is better.

20,285. Can you go up the ladders now?—Yes, but I must go up quietly. I cannot go up the ladders as I did 30 years ago. I think that I climbed too fast when I was young.

20,286. When you found your health failing, did you give up working in the mine?—When I found my health give way I was obliged to take it more quietly.

20,287. Did you put yourself under medical treatment?—Yes; I had some medicine from the doctors.

20,288. Did they advise you not to go on working?—No.

20,289. They let you go on working?—Yes.

20,290. Was that when you were working in Flintshire?—Yes.

20,291. When did you cease working underground?—It is nearly 30 years ago.

20,292. Has your health been good since?—No; my health has been poor ever since then.

20,293. Do you think that your health is worse than it was?—Yes; a great deal.

20,294. And you attribute it to the effects of the disease which you had when you were working underground in your youth?—No; I cannot tell what brought it on.

20,295. I thought you said that it was brought on by working underground?—No; I did not say that it was brought on by working underground, but I have been affected now for years.

20,296. But it was aggravated by working underground?—Yes; it fretted me very much; I was worse than I am now.

20,297. You were continually catching cold; and you attribute your illness to working underground, and getting hot and coming up to the surface in a perspiration, and not taking care of yourself when you arrived at the surface?—I dare say that it is a good deal from that.

MOLD.

Capt. J. Floyd.

16 July 1863.

20,298. (*Mr. Holland.*) Are you very liable to catch cold?—No; I am better than I was.

20,299. You say that you think that the mines here are cooler than in Cornwall at the same depth?—Yes.

20,300. What is the cause of that in your opinion?—Zinc strata is more porous. I think the copper mines are generally hotter than the lead mines.

20,301. Are these mines all in the limestone?—Yes.

20,302. Is there any chert?—There is chert in the eastern parts of these mines.

20,303. Is there much chert?—No.

20,304. Is there any differenee in the health of the men who are working in the chert and the health of those who are working in the limestone?—Not much difference I think.

20,305. How long does the powder smoke generally hang about in your levels?—It is according to the air.

20,306. What is the common time?—In our mine I do not think that it lasts more than an hour in the worst time.

20,307. How long does it hang so as to prevent the men from working?—It does not hang more than 10 minutes to prevent their working.

20,308. In Cornwall does not it hang longer?—Yes, in close places.

20,309. Is the ventilation much alike here and in Cornwall?—I think that the mines are worked on much the same principle here as in Cornwall.

20,310. And is the quantity of air passing through them much about the same?—Yes; but I think the Cornish mines are generally warmer than here.

20,311. At the same depth?—Yes.

20,312. Are a good many of your men affected in their chests?—A good many have been so affected about the country, but I do not know that they are all our men.

20,313. At about what age do they generally become affected?—It depends entirely upon where they have been working, whether in bad air or in good; some men are affected sooner than others.

20,314. Do a large proportion of the men become affected at about 40 years old?—I think about 50 generally.

20,315. Is it so large a proportion as to be remarkable among them?—No; I think not.

20,316. Have you many miners who attain the age of 50, without being very greatly affected?—I do not know, it may be so. You may find men in the country who are not affected at all.

20,317. Is it usual for them to be not affected when they are so old as that?—I do not know. The men in this county are not brought up entirely to mining the same as they are in Cornwall; they are brought up in farming, mining, and jobbing about; but the miners in Cornwall generally commence in the mines when they are young, and they continue in the branch that they are brought up to.

20,318. At what age do they generally begin working as miners here; are they generally fully grown men?—Quite young men.

20,319. They do not begin as boys?—No; not so young as they do in Cornwall.

20,320. Do you know about what age they are when they begin?—I should think from 18 to 20.

20,321. Rarely below 18?—I think that there are very few under 18 here.

20,322. Do men begin mining at 20 and 25?—Yes; I have known many men come from farms and from the surface.

20,323. Have you noticed that those who begin later in life bear the work better, or worse, than those who begin young?—I do not think that they are affected so soon.

20,324. Those who begin later in life, at 25 or so, are not affected so soon as those who begin earlier?—No; I think not.

20,325. You mean that they work a greater number of years before they become affected?—Yes, I think so.

20,326. Have you sufficient cases of that to be sure that that is a correct observation?—I do not know; I never studied the matter.

20,327. (*Mr. St. Aubyn.*) What is the size of the levels here as compared with those in the Cornish mines in which you have worked?—I think that the levels as driven now are much about the same size—6½ feet by 3½ to 4 feet wide.

20,328. (*Chairman.*) Do you come across any shale in your mine?—Yes; there is shale covering the runs of ore generally.

20,329. Does it ever happen to you that any carbonic acid gas comes from that shale?—I have never remarked it.

20,330. Do you consider it a good sign to meet with shale?—Yes; as a covering for the ore.

The witness withdrew.

Mr. GEORGE HUGHES, of Halkin, Flint, examined.

Mr. G. Hughes.

20,331. (*Chairman.*) I believe that you are the Mining Agent for the Marquis of Westminster?—I am.

20,332. You have the letting of the sets?—I have.

20,333. Will you describe to the Commissioners the mode in which you let them, whether for long or for short periods; are there a number of small sets let?—There have been a great many, but there are not so many now.

20,334. Those small sets are let for how long?—They are annual grants, renewable every year.

20,335. Other sets are let to adventurers for a period of years?—Yes; the smaller grants are swallowed up in a great measure by the larger ones now for which leases are granted for periods of 21 years. The present terms are 20*s.* a ton for a twelvemonth, renewable every first Monday in May; but I have very few of the smaller grants now.

20,336. You have a book showing the mode?—Yes (*producing a book*).

20,337. Has this system gone on for some time?—Yes; this system of letting has been going on for many years. They are on strings or veins which are numerous, close together, and bear shallow. They are generally let in small patches of 60 yards by 30, which they call two meres of ground.

20,338. Do the men who are working in other mines take any of these small sets?—Yes; that is almost invariably the case.

20,339. The miner works for how many hours in your mines?—Six hours; and he occupies the other part of the day on his own account.

20,340. That might tend to overworking; do they overwork themselves?—No, I do not think that they do; there has been a great strike about the overworking in our district; they will only work for six hours. In other places I find that they work for eight hours.

20,341. Does the six hours include changing at surface, or do they change down below?—I believe that the six hours embrace the whole, going down and coming up as well.

20,342. Should you say that the miners suffer in their health from working?—I do not mean to say that they suffer; but I cannot say that it is so healthy an occupation as surface labour.

20,343. I believe that the parish where you reside is principally a mining parish?—It is the greatest mining parish I suppose in the county; there is more of it in lead mines or open waste than is the case in any other parish.

20,344. Should you judge from the amount of poor rates in that parish that the miners die early?—Yes, there is no doubt about that; I conclude that from the pressure upon the parish in the poor rates.

20,345. How is that pressure upon the poor rates shown?—We pay more rate per pound by a good deal than the adjoining parishes.

20,346. Do you think that that arises from the families of miners coming upon the parish?—I cannot attribute it to anything else.

20,347. Could we get any return from the parish registrar showing that?—Yes; I have a return here (*producing the same*).

20,348. That return is for Halkin parish and Northop parish?—Yes.

20,349. Northop is not so much a mining parish?—Only a small portion of it.

20,350. Will you state what has been the amount of the rate in those two parishes for the last ten years?—In 1853 Halkin was 4*s.* 3*d.* in the pound and Northop 3*s.* 6*d.*; in 1854 Halkin was 4*s.* 6*d.* and Northop 2*s.* 6*d.*; in 1855 Halkin was 4*s.* and Northop 3*s.*; in 1856 Halkin was 3*s.* 6*d.* and Northop 2*s.* 6*d.*; in 1857 Halkin was 5*s.* and Northop 3*s.*; in 1858 Halkin was 7*s.* and Northop 3*s.* 6*d.*; in 1859 Halkin was 3*s.* 6*d.* and Northop 3*s.*; in 1860 Halkin was 6*s.* 3*d.* and Northop 3*s.*; in 1861 Halkin was 4*s.* 3*d.* and Northop 3*s.*; in 1862 Halkin was 5*s.* and Northop 3*s.*

20,351. Do the royalties pay a poor rate?—No, it is never asked; quarries pay but not mines; mines are very uncertain with us, we are not the same as they are in some countries, where a mine lasts for ages; even our best mine lasts for a very short while, as it is generally a shallow bearing.

20,352. What are the principal mines let to adventurers?—Rhosesmoor is the chief one; there are also Parrys Mine and Longrake; the others are all small mines and are nearly worked out.

20,353. Have the miners generally a piece of land attached to their cottages?—Some of them. A great many have stolen a bit of the common from time to time, and they keep a cow; the common is of great assistance towards keeping a cow; they make use of the piece which they have taken (perhaps an acre or two) for the purpose of getting grass for the cow in the winter, and in the fine part of the year they turn the cow upon the open common for which they pay nothing.

20,354. What does their food chiefly consist of?—I think that the miner lives quite as well as the farm labourer in this country, if not better; they grow potatoes, and they kill a pig, and they have a cow and butter and wheaten bread; sometimes they mix barley and wheat.

20,355. Have they meat?—Yes, occasionally; they manage to get a little meat, especially if times are good with them; then they have bacon; they have milk and potatoes, and bread and butter.

20,356. (*Mr. Loveson Gower.*) Did I understand rightly, that you attribute the higher poor rate of the mining district, compared with the agricultural districts, to the greater unhealthiness of the miners?—I cannot account for it in any other way. The pressure upon the poor rates must be from the number of paupers in the parish, and if it is not the miners that cause it I do not know what does it.

20,357. Would not uncertainty of employment cause it?—No, I do not think that it would; they move about. When the Minera Mine started we had very few miners in our district; they go away if they find any place where they can do better on their own speculation, and fall back upon their own adventure if the price of lead ore is high. The prices are very good now; we have 13*l.* or 14*l.* a ton for our ore.

20,358. Is there not a large floating mining population which is unemployed?—There always will be, I suppose, in all mining districts. I do not know that there is more in our district than anywhere else; I think that ours, if anything, is better than elsewhere.

20,359. As comparing a mining district with an agricultural district would not that rather account for it?—No, I think that it is quite as regular as in an agricultural district, for it depends in a great measure upon the price of corn how many labourers the farmers will keep; it is low now, in fact it is so bad with the farmers in our district that I do not know what is to become of them if it lasts much longer; the price of corn is so very low and the yield is so excessively small, that they cannot afford to keep the number of labourers upon their farms that they used to do.

20,360. Are the miners a provident set?—I cannot say but that they are; when they get a great deal of money in a very short while, like most speculators, it excites them, and there is a little stir among them.

20,361 (*Mr. Kendall.*) Have you ever gone though the cases of pay in any of your parishes; is the pay to the widows and children of miners principally?—We have a vestry periodically for that purpose.

20,362. Do you find that the recipients of pay are principally the widows and children of miners?—We have hardly anybody else in our district; they are all miners nearly.

20,363. Or is it more to worn out miners?—I suppose both; the young men die as well. There is a certain kind of stone which does not agree with them; we have a certain stone at times which tells very heavily upon a man's health, and it is so in all mining districts that I have been at. At Talargoch it is so.

20,364. You have spoken of small sets renewable year by year; you say that the men who work in the large mines only work for six hours, and spend also a portion of their time in working these little private concerns of their own?—Yes.

20,365. Do the adventurers and captains and agents of these large mines object to men working in both mines?—Not at all, except it is the pitman or anybody of that sort, where the whole of his care should be devoted to the large mine.

20,366. But when a man only works six hours a day, they do not at all care where he works afterwards?—Not at all.

20,367. There is no suspicion that he will only work light for them and harder for himself?—They do not care if he does, because it is either by ton or yard work.

20,368. Supposing a man is on tut-work and only works four hours, do they take notice of it?—Yes.

20,369. They make him work six hours?—Yes, the agent generally goes there to see the men go down and come up.

20,370. Have you any of those small sets within reach of this place?—About three or four miles off.

20,371. In these small workings do the men sink deep at all?—No.

20,372. How deep do they ever go?—They start from the surface.

20,373. And how many yards down do they go?—It depends upon circumstances.

20,374. What is the deepest?—Our district will not I think pay for working above 80 yards deep. We have seen bunches. Rhosesmoor is an exception, because they did not find the lead ore there till they got 80 yards deep; it is the same range of bearing measures.

20,375. In these small workings, how far do they generally go?—From five and six up to 20, 30, and 40 yards down; if they get anything which makes it worth while; they go down after it.

20,376. Do they ever work at risk to their health as regards ventilation?—I do not know that they do; the bearing is so shallow, that it will pay them better to sink a bit of a hole; they can do nothing if they have no air, and the expense is so trifling to relieve themselves of the foul air that it is easily adopted.

20,377. Can you sink at small expense?—Yes; I should think that you can sink at 10*s.* a yard, up to 20 yards deep in many places, except it is in rock.

20,378. How many men together generally take these little workings, two or three?—We generally let 60 yards by 30 for two, that is our rule, and I believe it is generally carried out.

20,379. I suppose that the same takers have the

first chance on the set being again let?—We never take it from them as long as they wish to work it.

20,380. (*Sir P. Grey Egerton.*) Do both men of the pair work underground, or is one bringing out the ore and the other working?—They both work underground.

20,381. Till they have an accumulation of ore?—Yes, and then they get assistance to bring it out; they very often get a man at the top while they are both below; if they can manage without assistance they do.

20,382. Do they dress the ore themselves, and prepare it for market?—Yes; sometimes when they are not used to it they get a man to finish it.

20,383. Have you any check upon them?—Yes.

20,384. Are the cottages of the miners tolerably comfortable?—Some of them are; I think that you will find them, for the most part, clean and tidy; they are chiefly cottages built by themselves; they are squatters; rather than get a comfortable good cottage for 2*l.* a year, which is our usual rent, a man would prefer spending 100*l.*, or the whole of his labour, let him be ever so lucky.

20,385. But whether they live in their own cottages, or lease them from Lord Westminster, you think that they keep them clean?—Yes.

20,386. Are they a sober set?—Yes; the Welch miners are rather religiously disposed.

20,387. Are they Methodists?—Yes; different kinds of Methodists; Independents and Wesleyans and Baptists, and so on.

20,388. What schools are there of yours?—Lord Westminster has his own school at Halkin, to which all the children of the parish are invited; he pays the master and mistress, and has built the school and houses, and every accommodation, and he pays rates and tithes, and everything else connected with it.

20,389. It is entirely at his own expense?—Yes; he pays sufficient for a good master and mistress, but I believe that the clergyman charges some few pence to the children.

20,390. Is it under Government inspection?—Yes; it has been placed so not long since; in fact a Government inspector has always been invited to inspect it.

20,391. And you find that sufficient for the children of the district?—Yes, it is ample; there are three or four schools upon the Common.

20,392. Private schools?—No, National Schools.

20,393. In addition to Lord Westminster's?—Yes; and he subscribes very liberally to each.

20,394. (*Chairman.*) What precaution do you take in any of these small workings, when they are abandoned, to prevent any accident?—We bind them to close them up and secure them, and we fill up many of them every year; but still you will find a great many of them merely covered over; we covered the whole of them over a short time ago, but the boys about there take delight in knocking them down, and it is fine fun for them.

20,395. (*Mr. Kendall.*) Are there any take-notes in these sets?—Yes.

20,396. (*Mr. St. Aubyn.*) Do you bind the renters to cover them up?—Yes.

20,397. (*Mr. Kendall.*) Do they do it?—If they do not, we do it, or try to do it.

The witness withdrew.

[*The table on page* 476 *was attached to the evidence of this witness.*]

Captain JOSEPH NINNIS, of Maes-y-safn, near Mold, examined.

20,398. (*Chairman.*) Of what mine have you charge?—Maes-y-safn.

20,399. Have you charge of any other mines?—No.

20,400. What is the description of ore of your mine?—Lead.

20,401. How many men are at present employed underground?—About 210.

20,402. What number of hours shift do they work?—Eight hours.

20,403. Are there any boys?—Three boys underground.

20,404. What are those boys employed in?—They assist the men in beating the borer.

20,405. Do the men go down by ladders?—Yes.

20,406. What is the deepest level at which you are now working?—310 yards from the surface.

20,407. What are your principal operations now in the mine, are you driving or sinking?—We are sinking two shafts and driving a great many levels, perhaps ten.

20,408. Are the men principally tut-work or tribute men?—Tut-work.

20,409. What allowance of candles have the men?—Two pounds a week.

20,410. What are they charged for them?—Eightpence.

20,411. And for powder the same?—Yes.

20,412. Is the mine worked by water or by steam power?—We pump by two steam-engines, and have one water-wheel.

20,413. Was not the water very much in the mine when you had charge of it first?—Yes; about 50 yards at the bottom of the mine was filled with water and sand.

20,414. Is that the case now?—It is all cleared now.

20,415. I think that you have not put up any changing houses yet?—No.

20,416. Did you know a case where a man suffered before you came there?—I was informed so by the men.

20,417. What was it?—That a man came one morning, and his underground trousers were frozen so stiff, that they could stand up, his partners tried to persuade him not to go down in them, he said "nothing will hurt me." He came up and took cold, and was in his grave about two months after that, so I was informed.

20,418. So that you consider changing houses very important?—Yes.

20,419. Do the men pay club money?—No; only the doctor; the men pay 6*d.* a month to the doctor.

20,420. Is the doctor appointed by the adventurers?—Yes.

20,421. What is his name?—Dr. Hughes of Mold.

20,422. Is a month kept in hand of the pay of the men?—Only a fortnight.

20,423. Are any women employed in the mine?—No.

20,424. (*Mr. St. Aubyn.*) Did you ever work in Cornish mines before coming here?—Yes.

20,425. Whereabouts?—In different mines; chiefly at Perran St. George and Perranzabuloe.

20,426. How many years were you working there before you came here?—I have been agent about 16 years; I have been here for two years.

20,427. You are very well acquainted with the condition of the miners in Cornwall?—Yes.

20,428. Speaking generally, what should you say was the condition of the miners here as compared with that of the miners in Cornwall as to health?—I should say that it was equally as good; I am not much acquainted with the district; I have only come from Cornwall about two years, and have been confined to the mine that I am engaged in.

20,429. Are the mines here better ventilated than they are in Cornwall?—They are equally as good here.

20,430. Not better?—No, I do not say that they are; it depends upon the management of the mines in Cornwall. Where there is pretty good management, there is pretty good ventilation. Where the management is defective, the ventilation is defective.

20,431. Is the management better here generally than it is in Cornwall?—It is just the same.

20,432. In Cornwall you knew men who were suffering from the miners' disease?—Yes.

MOLD.
Capt. J. Ninnis.
16 July 1863.

20,433. Do men suffer from that here?—I have known of one or two cases of men, about 50 or 55, I should think that it was what they call the miners' consumption.

20,434. Do as many suffer from it here as in Cornwall?—I should think not.

20,435. To what cause do you ascribe that difference?—Perhaps it may be from a difference in the ventilation of the mines, or the purity of the air underground; I do not know any other cause of it; but I think that this is a very healthy climate.

20,436. Do you mean to say that the air is more healthy above ground in Wales than it is in Cornwall?—I do not know, I get on a little better here than I did in Cornwall; there, there are different gases. I am no chemist, but I question whether lead would throw off the gas that copper does. Copper and mundic or iron pyrites may be more injurious to the constitution than lead.

20,437. You think that the better health of the miners, is owing to the nature of the mines?—Yes.

20,438. And not owing to any improved system of ventilation?—No.

20,439. Or any improvement in the management—No.

20,440. (*Sir P. Grey Egerton.*) Are you of opinion that working in limestone is more healthy than working in killas or granite?—I think that limestone is pretty good, but I think that the shale is heavy; there is some little shale in our mine, and the miners complain when they get into that rock to work.

20,441. (*Mr. St. Aubyn.*) Are your mines as deep here as they are in Cornwall?—Much about the same I think.

20,442. What is the depth of your mine where you are working now?—About 155 fathoms below the surface—310 yards.

20,443. (*Mr. Kendall.*) Did you come from Perranzabuloe?—No, I came from St. Agnes; but I worked when a young man at Perranzabuloe for ten years.

20,444. Where did you first pitch in Cornwall to work?—In St. Agnes.

20,445. Did you work much out of St. Agnes?—Only in Perranzabuloe.

20,446. Are not St. Agnes and Perranzabuloe supposed to be very healthy parts of Cornwall?—Yes; but more particularly St. Agnes.

20,447. I believe it is assumed to be the healthiest part in Cornwall; taking that and taking this district, you think that the miners on the whole have less disease here than they have in Cornwall?—I should think they have from what I have seen of it; two years is not much experience. I came direct from the Marazion district here.

20,448. You say that you are no chemist; you do not offer an opinion on it; but you fancy that the gases may be different here from what they were in Cornwall?—Yes.

20,449. But still your experience here is long enough to tell you that the moment the men come to shale they suffer?—Yes.

20,450. Did you ever see a candle go out in shale; did you ever see a candle go out in any of your mines here?—No; I have seen it in Cornwall, but not here. Men now work in our mines who are upwards of 70 years of age, and who have worked in Maes-y-safn Mine all their days.

20,451. How many men have you altogether?—Two hundred and ten.

20,452. Out of the 210 have you 20 men working of 60 years of age?—I think that we have.

20,453. Have you five men of 65?—No, hardly, underground; we have three old men 70 years of age and above.

20,454. Do you take in any men above 20 who never were miners to work underground?—Yes, we have done so; first of all they go to fill the kibbles and underground waggons, then they get in as labourers, as bargain men, and so on.

20,455. Have you any Cornish men working with you in your mine as miners?—We have three Cornish men as pitmen, and a timber-man, and there is another young man, but he is on the surface at present.

20,456. Did they work much in Cornwall?—Yes, all their days.

20,457. Have you heard any of them say that they find their health better here than in Cornwall?—No, I have not heard them say so, but they enjoy their health very well.

20,458. Are they all young men?—One is about 48 and the other two about 24.

20,459. Is the man at 48 strong and healthy?—Yes.

20,460. How long has he been in this neighbourhood?—Two years.

20,461. He came up with you?—Yes, about the same time.

20,462. You say that you have been here two years as agent?—Two years last month.

20463. When you came here was it the first time the mine was started afresh?—Yes.

90,464. At that time the mine was in a very bad state as far as ventilation went?—No.

20,465. The old miners followed the ore wherever they could?—Yes; they went down in the bottoms.

20,466. Without regard to ventilation or anything else?—They had pretty good ventilation, because the bottom was open and they had a railroad right in the middle of the workings; the ventilation was as good as it is now.

20,467. The ventilation was good, but then the woodwork and things of that kind were in bad order?—Yes.

20,468. Since you have been here your ventilation has been pretty good, except just before holing?—Yes.

20,469. Before holing have you ever had it so bad that you have been obliged to put the men to work short stems?—Never.

20,470. Now you can work 16 hours out of the 24?—Yes, pretty well.

20,471. Sometimes you only work eight hours?—Yes.

20,472. Do you not think it worth your while before holing now and then to have a fan?—I do not know; the air is only bad for a short time, and then it is not very bad; it is fairish air for underground. I have seen ten times worse air; I do not think that the air is injurious at present.

20,473. The men do not complain?—Not at all.

20,474. And they do not seem to suffer?—They do not.

20,475. The candles burn brightly?—The candles burn quite upright. In a month or two more we shall hole.

20,476. How many fathoms do you drive off from an air hole before you begin to feel a difference, as far as the candle goes, generally speaking?—The candle will burn very well for 30 fathoms, but after that it gets very flat.

20,477 How long is it before it begins to show a difference; ten fathoms?—Yes.

20,478. As a fan is not an expensive instrument, might it not be an economy to use a fan the moment you find a difference in the candle?—I think that the best way would be when we get the mine in a proper course of working to keep air sollers, that is the best ventilation, that is always drawing, but a boy does not work.

20,479. Do you not think that the moment the air begins to get a little dull you ought to have either a soller or a boy; would not that be economy?—Yes; a soller would be the best.

20,480. (*Sir P. Grey Egerton.*) Would it not pay you to get rid of the smoke in a shorter time out of that end?—I do not think that we could get more work done.

The witness withdrew.

Mr. Peter Parry, of Mold, examined.

Mold.

Mr. P. Parry.

16 July 1863.

20,481. (*Mr. Holland.*) You are the coroner for this district?—I am coroner and a general practitioner; I have been coroner for 47 years; I am the oldest coroner in England.

20,482. How many inquests have you held?—I have held 3,256 inquests in this county, besides having acted in Denbighshire upon two occasions, upon the death of one and the removal of another coroner. I held last year 99 inquests in this small county and 28 adjournments, most of the adjournments were in colliery cases.

20,483. Are the inquests chiefly among colliers or miners?—Colliers.

20,484. Do fatal accidents occur among miners?—An accident occurred and 16 miners were killed at Bryngwiog Mine, near Halkin Mountain in Halkin parish.

20,485. What caused their death?—An overflow of water; it came down in torrents upon them, and drowned them all from the old workings.

20,486. How long ago was that?—I think it was on February 12th, 1862; inquests concluded March 6th, 1862.

20,487. Did you hold an inquest lately upon a miner?—Not later than yesterday.

20,488. What was he killed by?—He fell down a shaft by going down in a kibble.

20,489. At what mine was it?—Axton Mine, parish of Llanasa.

20,490. Have you had other such inquests as that?—Yes several; there were three going down in this case, the man's hand slipped and he fell to the bottom.

20,491. From the kibble?—Yes; there were three in the kibble.

20,492. Have you had accidents from falling from the ladders?—Yes, at Talargoch and other places.

20,493. Have you had inquests upon men killed by powder blasting?—Yes.

20,494. Several?—Not many, considering that it is a mining district.

20,495. You are a practitioner as well as a coroner?—Yes; I have been a practitioner 56 years.

20,496. Are injuries by powder blasting, which are not fatal, common?—Not very common, but I have met with very dreadful cases of that kind; I have been surprised that they have got off with their lives, and they are disfigured sadly at times.

20,497. Has there been loss of eyesight?—Yes.

20,498. Which are the healthier men, colliers or miners?—I see colliers who are old, but I cannot find an old miner.

20,499. Are there many old colliers?—Yes.

20,500. What disease shortens the miners' lives?—Their general health is affected, their stomach and bowels get out of order, and it affects the whole system, the lungs and everything; they become asthmatical and affected in their breathing, and in their bowels too; they have very acute pain sometimes in the bowels and stomach; I do not know what that is from.

20,501. Do a large proportion of them become asthmatical?—Yes, a great number; we have some poor people now begging about; I have not been so much amongst miners of late years.

20,502. Is disturbance of the stomach and bowels very common among them?—Yes, very common.

20,503. (*Chairman.*) Did you ever hear of an explosion of fire damp in any mine?—Yes, about 25 years ago in Talargoch Mine, a lead mine; there is coal in that neighbourhood, and it must have been from that coal.

20,504. Did persons loose their lives from it?—Yes, two persons lost their lives from explosion; I held an inquest. The Inspectors of Mines were astonished at it. The memorandum I have in my book 25 years ago does not say the men died. One man died from the fall of the roof at that date.

20,505. (*Mr. Holland.*) Was there any coal at all in that mine?—I did not observe it; it must have been there; the miners did not tell me that there was any. There are coal and lead at Trelogan Mine.

20,506. (*Chairman.*) Have you a record of six cases at Bryngwyn Mine on which you held an inquest?—There were seven cases and the following are the particulars of them:—James Clarke, aged 24 years, miner, Mold, died September 4th, 1854; inquest, September 6th, 1854; verdict, casually killed by foul air in a lead ore mine shaft. John Jones, aged 16 years, miner, Mold, died September 4th, 1854; inquest, September 6th, 1854; verdict, casually killed by foul air in a lead ore mine shaft. George Oldfield, aged 42 years, miner, Mold, died September 4th, 1854; inquest, September 6th, 1854; verdict, casually killed by foul air in a lead ore mine shaft. Thomas Oldfield, aged 14 years, miner, Mold, died September 4th, 1854; inquest, September 6th, 1854; verdict, casually killed by foul air in a lead ore mine shaft. Charles Matthews, aged 44 years, miner, Mold, died September 4th, 1854; inquest, September 6th, 1854; verdict, casually killed by foul air in a lead ore mine shaft. William Oldfield, aged 22 years, miner, Mold, died September 4th, 1854; inquest, September 6th, 1854; verdict, casually suffocated and smothered in a lead ore mine shaft from the effect of impure air. Thomas Morgan, aged 29 years, miner, Mold, died September 4th, 1854; inquest, September 6th, 1854; verdict, casually suffocated and smothered in a lead ore mine shaft from the effect of impure air.

The witness withdrew.

Mr. Robert Parry, of Mold, examined.

Mr. R. Parry.

20,507. (*Mr. Holland.*) How long have you been in practice as a surgeon?—About 35 years.

20,508. Have you had much practice among miners?—Yes, a great deal; and before I was in practice for myself.

20,509. Is lung disease very unusually prevalent among them?—It is a very common disease among them. Lung disease is the principal disease which the lead miners have.

20,510. Have many miners the disease before they apply for medical assistance?—They are ill for many years, and they say that they are not ill, and they do not apply unless they contract to pay the medical man, and then they will come at any time they like; but others do not apply at all, or very seldom. The fact is, that they cannot afford to pay.

20,511. What number of hours do the men generally work?—Six, and some of them eight; there was a dispute about it. I have asked the miners when they were in health, and they say that six hours is plenty for any man.

23,512. Have you noticed that the men who work eight hours are more unhealthy than those who work six hours?—No; I cannot say as much as that, because I never took that notice. But they tell me themselves that they cannot stand the eight hours; that it is too much for them, and that six hours is as much as ever they can stand. I have often asked them why they did not work longer, the same as the collier. The collier works 12 hours.

20,513. What do you hold the disease to be that they suffer from?—We have never had an opportunity of a post mortem examination, but there is evidently a shortness of breath. I should say that it was chronic bronchitis, but they do not complain of acute pain; we do not see them then.

20,514. Does the disease come on very slowly?—A boy goes to mine work here at 11 or 12 years old, and they do not complain much until they are 25 or 30.

Mold.
Mr. R. Parry.
16 July 1863.

20,515. Do they commonly go underground so early as 10 or 12 years old?—They go underground to watch doors, or something of that sort. Most of those boys who are employed at 12 are washing ore upon the bank.

20,516. At what age do they go underground?—Say at 16 to begin with, or 18; most of them at 18.

20,517. Do you often see them ailing below 25?—No; not often. Most of the miners go mining, and then they go to farmers, and then when they get married, they go to the mines again.

20,518. At about what age should you say that they begin to show evident disease?—Between 40 and 50. A miner is a very old man I should say, in his constitution, at 45.

20,519. Are there many miners of 45, who are quite sound in their lungs?—I do not think that there are many of 45 who are not affected if they are constantly underground as common miners, though agents and others who do not go underground often are not so affected.

20,520. Do you consider a miner of 45 an old miner?—Yes; and at 50 a very old miner upon the general run.

20,521. Is there much spitting with this complaint?—Not at first, but at last there is. All of them smoke tobacco, and they drink a great deal. They drink as much as ever they can catch hold of, and they are not paid so often as colliers are; colliers are paid every week or every fortnight; the miner is only paid every month, and they cannot get drink unless they have money in their pockets, and that is the chief time when they get it.

20,522. What do they drink chiefly?—They drink nothing but ale.

20,523. Does their drinking hurt them much?—No; I think that it does them good.

20,524. How?—It acts upon the bowels; they always say that they are better after drinking.

20,525. What sort of ale do they drink?—Bates's ale.

20,526. Do they drink it quite new?—Yes; if it froths up like cream on the top of the glass it will do.

20,527. We have been told that there is not a special amount of lung disease among miners, is that so?—There is no doubt about it.

20,528. You are quite sure that there is?—There cannot be a doubt about it; I could bring you the miners to show you. At this time of year the bottom of the place is very close, but then the miners work a great deal upon land at this time of the year; the miners go out to harvest; they go out a great deal to the hay harvest.

20,529. Do they mend in health after working at the harvest?—Yes; they have good health then, and they go to the corn harvest. Mine work in this country is not so good as it used to be. We have hardly any lead mines in Flintshire, unless it is at Talargorch.

20,530. (*Mr. Kendall.*) How many mines do you attend?—I do not attend many mine works now; we have none in the neighbourhood. The small miners do not club together at the mines, but attend a great many beneficial societies, and most of the members of those societies are lead miners.

20,531. They belong to a club?—They belong to a beneficial club and I attend a great many of those clubs, all the large mines have a medical man attending to the works, but we have none in this immediate neighbourhood at present except Maes-y-safn Mine. I attend a great many club men who are nearly all miners.

20,532. Taking your patients what is the proportion of your miner patients to the agricultural patients?—They seem to be mixed; we cannot tell in the club.

20,533. You know when a man is a miner and when he is not a miner?—Yes; but I never made the calculation.

20,534. Upon the whole what should you think when you have to attend a patient, you can decide at once whether he is a miner or not?—Yes, you can easily tell; in a collier the disease will work off, but if a miner once begins in the lungs you very seldom see him recover but it rests upon him all his lifetime and he drops off. I have seen men that I would say were not fit to crawl out of bed or over the door sill going to their work and doing a day's labour as they say.

20,535. I understand you that in consequence of many of these men having little mines of their own there is no mine club?—Not many.

20,536. And they do not belong to clubs, and therefore they will let the disease go on before they go to the expense of employing a medical man?—Yes; that is what I mean.

20,537. Many of those men being private speculators and poor men they do not belong to a mine club to avoid the expense of a doctor they allow incipient disease to go on, and it becomes chronic?—Yes.

The witness withdrew.

Captain Francis Evans, of Wain near Mold, examined.

Capt. F. Evans.

20,538. (*Chairman.*) Of what mines have you charge in this neighbourhood?—Bryngwiog Mine, Longrake, Billins, Pentre, Devereux, and Little Cathole.

20,539. How many men altogether have you working underground?—We have 110 men at Bryngwiog, 30 or 40 at Billins, those are the principal mines, the others are small.

20,540. Bryngwiog is the principal mine?—Bryngwiog and Longrake are the principal mines just now.

20,541. Are you sinking there or driving or both?—The principal thing which we are doing in the four mines is sinking an engine shaft, we have four engine shafts sinking.

20,542. Where you are sinking have you any artificial means for providing air?—None at all, except in many cases from the different levels. We always take care to have winzes sunk in advance of the levels so as to get down by the time the levels reach them; we sink the winzes before the driving so that when the driving comes up underneath them we communicate. We consider 20 fathoms generally speaking far enough.

20,543. You would not recommend driving a level further than 20 fathoms?—No; you cannot ventilate the bottom of a mine sufficiently unless you do that; that I believe is the system generally adopted in Cornwall and that is what I carry out here.

20,544. Have you no deficiency of air?—No, except in very hot weather in the summer, and I think that that occurs almost everywhere whether shallow or deep, from what I have seen.

20,545. It does not depend upon the depth of the mine?—No, but upon the atmosphere.

20,546. How many hours shift do the men work?—They work very little in this part of the country; I should think that four or five hours is quite as much as they do.

20,547. They work six hours shifts do they not?—They call it six hours but they relieve at surface, and by the time the parties get up and the other parties get down there is a difference of an hour or an hour and a half I should think.

20,548. Do the men work on their own adventures; do they employ their spare hours in working small adventures?—A great many of them do, but we object to it; we pay them what we consider fair wages and we expect to have their labour.

20,549. But you do not get so much work done as you think they might be able to do?—We consider not.

20,550. Do you know of any men suffering from the work?—We do not see much of it.

20,551. Where do they reside?—Most of them reside in the neighbourhood of the mines.

20,552. Have they houses of their own and a bit of land?—Some of them have, but generally speaking they are not very careful people.

20,553. Do they belong to the neighbourhood generally or do they come from a distance?—They generally live in the neighbourhood of the mine.

20,554. What amount of candles are allowed them?—We allow them 2 lbs. a week each, but they do not burn them; it is the custom of the country.

20,555. What do they pay per pound?—We charge them 8*d.*

20,556. And the same for powder?—Yes; every mine has its different price generally.

20,557. Have you a mouth in hand of the pay?—No, we only keep a fortnight; at some of our mines we only keep a week; but I think that a fortnight is the time which ought to be allowed.

20,558. You think that it is quite possible in mines to pay, only keeping a fortnight in hand?—Yes; I think that a fortnight is quite long enough; I should say that there ought to be a fortnight and that a fortnight ought to do.

20,559. Would a month in hand lead the men to be more in debt?—I should think that a month was too much generally speaking, unless it was a very large establishment.

20,560. (*Mr. Kendall.*) What are the average wages of the miners here?—They do not work at all under 15*s.* a week; I think that they get that throughout the country.

20,561. Working five hours a day they get equal wages to the Cornish men who work eight hours?—Yes, they get even better wages; they strike if they do not.

20,562. What do they do in the remainder of their time?—I am sorry to say that a good deal of it is spent in the public houses.

20,563. They drink a good deal do they?—They do.

20,564. Have you worked in the deep mines in Cornwall?—Not very deep; I have not been much connected with a deep district. The deepest that I have worked in was 90 fathoms.

20,565. What is the deepest mine you have been in here?—Ours is the deepest; it is 90 fathoms.

20,566. Do you think that the air in the 90 fathoms here is purer than in 90 fathoms in Cornwall?—I think it is.

20,567. Do you know why; is it from the difference in the strata or not?—It is particularly as to copper mines; the air in copper mines is hotter, In tin mines I think it is just the same as it is here; just the same as in lead mines, except that in the shallow mines here the air is very bad but they are not worked on the vein, they are worked on what they call flats, beds, and then the stratification is different, it is more of a clay and sand and soil.

20,568. And that is bad?—It is.

20,569. Where have you any lead deposits flat in this neighbourhood?—All east of Maes-y-safn on this side of the hill.

20,570. Is the flat lead immediately under the mountain limestone?—No, it is rather over it; they get a kind of limestone, but it is mixed a good deal with clay and sand.

20,571. How is it in the shale?—The shale deposits of course are connected with the coal formation; the shale and dark limestone and sandstone generally are between what they call the white limestone and the coal formation; it is on the borders.

20,572. What is the thickness of your deposit of lead generally speaking?—Some of the flats lying on this side of the hill towards the coal formation have an abundance of ore; in some places it is 16 feet thick.

20,573. And then they dip out?—They dip out at the surface.

20,574. Can you speak of the air in the neighbourhood of shale?—Those flats are not so easily ventilated, because the levels have to be driven almost horizontally.

20,575. Do you think that any gases come out?—I have never proved it.

20,576. Is the health of the miners generally throughout this district pretty good?—Very good.

20,577. Do they suffer much from cough and asthma and that sort of thing or not?—Not to the same extent that Cornish miners do.

20,578. Notwithstanding that they drink more than the Cornish miners?—A good deal.

20,579. Still their health on the whole is better?—We do not see many sick miners amongst them. They take a great deal more care of themselves.

20,580. You mean that they do not work so hard?—They do not work to the same extent, and when they get to a certain age they manage to do without working somehow. They go off to farming or get a little venture by themselves, and do a little.

20,581. After they get to a certain time of life they contrive to get other occupation?—They will leave off underground work if they can once get a little venture of their own, as they call it, where they can pick up just a little piece of lead. They live cheaper than Cornish men; at least they are more contented.

20,582. They do not live so well as Cornish men?—No. The Cornish men as far as animal food goes, I think, make use of more of it; bread and butter is the principal diet here. They are more contented with their coarse living.

20,583. They have more money, the living is cheaper, and they drink more?—They spend it in drink. They have a custom, no matter what family they have, of giving their wives 12*s.* a week and no more, and spending the rest.

20,584. It is an understood thing?—It is a custom amongst them.

20,585. That the home consumption is 12*s.*, and whatever the size of the family is the man drinks the rest?—Yes.

20,586. (*Sir P. Grey Egerton.*) If he gets 15*s.* a week he only keeps 3*s.*?—Yes.

20,587. (*Mr. Kendall.*) Do they work much on tribute here or not?—Yes. They are not bad tributors.

20,588. Do they get many starts here or not?—The present system is to limit them as to the quantity.

20,589–90. You prevent their getting starts?—We prevent their getting starts if we have an opinion of the place where they work. It is of no use to give them extra wages, they only stay away from their work, and spend their time, and lose their money. They go to Liverpool and one place and another, and stay away till they have spent the whole.

The witness withdrew.

Adjourned to To-morrow at Rhosesmoor Mine.

MOLD.

Friday, 17th July 1863.

PRESENT:

The Right Hon. Lord KINNAIRD, K.T.	NICHOLAS KENDALL, Esq., M.P.
Sir P. GREY EGERTON, Bart., M.P.	JOHN ST. AUBYN, Esq., M.P.
The Hon. E. F. LEVESON GOWER, M.P.	P. H. HOLLAND, Esq.

The Right Honourable Lord KINNAIRD, K.T., in the Chair.

RHOSESMOOR MINE, NEAR MOLD.

Mr. THOMAS ROBERTS, of Rhosesmoor Mine, examined.

MOLD.

Mr. T. Roberts.

17 July 1863.

20,591. (*Mr. Kendall.*) You have a large interest in this mine, have you not?—I have one eighth of it.

20,592. You know a good deal about the mine; you are here a good deal, are you not?—I am here almost every day.

20,593. You do not go underground much?—I have not been underground these two years.

20,594. But still you know all about it from hearsay?—Yes.

20,595. How is the air in your mine?—Very good; there is plenty of air.

20,596. Have you any bad air in the 100-yards level west, in the end?—Yes. We have stopped that. The object of it was to make a day level. We went many yards, and then stopped it; there was no ore in it.

20,597. How far off from the west whim shaft have you gone?—I suppose it is nearly 100 yards.

20,598. You went about 100 yards, and the air was bad?—Yes; and it was very hard. We were driving this to meet the level.

20,599. You found the air bad, and the end hard?—Yes.

20,600. Do you recollect how many pounds you were giving a yard when you stopped?—*5l.* 10*s.*; another was 6*l.* That was in October last.

20,601. Did you use any artificial means of throwing in air,—any fan machine?—No.

20,602. How many men worked in the west end during the 14 hours?—Only six. It was standing from 12 at night till 6 in the morning; there were six hours that they were not working.

20,603. But even with that the air was bad?—Yes, very bad. We found that there was no sign of commencing the day level.

20,604. How many men have you working altogether?—66.

20,605. Do you work upon tutwork or upon tribute?—Both.

20,606. Is the tribute so much a ton?—Yes.

20,607. I suppose that it varies a good deal?—There are different prices.

20,608. From what to what?—From 15*s.* perhaps to 7*l.*

20,609. What wages do you let your men get upon the whole; what do they average?—I cannot tell.

20,610. 3*l.* a month?—There are different prices, according as we set a bargain.

20,611. But will they average, taking one with the other, about 3*l.*?—Somewhere about 3*l.* It is more or less; we cannot say.

20,612. In what part of the mine are they now working principally?—From the west to the east.

20,613 On the 120?—Yes; they are working in different. parts.

20,614. From the 120 up to the 100, have you taken away nearly all the ore?—Yes.

20,615. Then you have not got much reserve?—No. We have been getting some here lately (*pointing to the plan*), above this level.

20,616. How deep is your sumpt shaft?—These two shafts are 140 yards deep, and we are now driving two levels; one to the west and one to the east. We think that we can get this level to the west a little further.

20,617. Have you tapped the water going west as yet?—No.

20,618. Are you now going through a good course of ore?—Yes. In driving this 140 level we expect that we shall tap the water.

20,619. Have you had any accidents this year?—No.

20,620. Have you had any since you have been in the mine?—Only one.

20,621. How did it occur?—It was the boy's own fault.

20,622. What was the accident?—It was at the dinner hour.

20,623. What did he do?—He went down the footway shaft, and when they were coming up there were three or four of them; and when he was below, about two yards from the top, down he went.

20,624. (*Mr. Leveson Gower.*) Was he killed?—Yes.

20,625. (*Mr. Kendall.*) How do you go up and down; by ladders?—By ladders.

20,626. It is all by ladders?—Yes; they can go down this engine shaft with ladders.

20,627. Which is your winding shaft, the eastern or the western one; you have two east whim shafts?—Yes.

20,628. Which of those two easterly ones do the men go down?—The engine shaft; there is no winding up this shaft.

20,629. Is there any division in that shaft which the men come up, or do they come up in the same shaft without any partition?—There is no partition.

20,630. So that there is no division between the ladders by which the men come up in that shaft and the engine?—No, I do not think there is. They generally go by the other shaft, that is to say, the footway shaft.

20,631. (*Mr. Holland.*) But they go by the engine shaft sometimes?—Yes.

20,632. (*Mr. Leveson Gower.*) Have you any boys now working underground?—No; the boys are all in the washing.

20,633. How old was the boy who was killed?—I cannot say; perhaps 14; but it was not his business to go down, it was only his wickedness.

The witness withdrew.

BRYNGWIOG MINES.

Captain FRANCIS EVANS further examined.

Capt. F. Evans.

20,634. (*Mr. Kendall.*) How long have you been working these mines?—About four years.

20,635. How long had these mines been working, from report, before that?—The old mine, I have heard, was working 60 or 70 years ago.

20,636. And how long had they stopped before you resumed working?—This was a separate company to the old mine (*pointing to the plan*).

20,637. Your present mine embraces two old mines?—Yes.

20,638. One old mine was stopped many years ago?—Yes; the western part stopped 70 years ago.

20,639. The eastern part stopped how long ago?—I have heard 15 or 20 years ago.

20,640. Were there any working plans of either of those two mines left?—No, I believe not.

20,641. Neither the old nor the new?—No, not to show the extent of the mines.

20,642. Did any accident occur in consequence of your not having those plans to refer to?—Yes; the first extended on the 52 fathoms level west.

20,643. How far did you extend?—About 80 fathoms.

20,644. Why did you stop then?—Because we were afraid of the old mine water.

20,645. Then you commenced driving on the 66 fathoms?—Yes.

20,646. How far did you extend?—About 60 fathoms.

20,647. What occurred then?—We broke into the old mine then.

20,648. You suddenly came upon water?—Yes; and in consequence 16 men were drowned.

20,649. Having extended about 80 fathoms on the 52, I suppose you thought you were quite safe in going as far as that on the 66?—Yes; and that came out in evidence on the coroner's inquest.

20,650. Can you explain why you should happen to tap the water on the 66 fathoms level?—The old men found a bunch of ore on the 52 fathoms level, and they followed it down in a diagonal direction, going east; and, besides that, the level from the old mine was driven further east than people generally said, and there were no plans to show the exact state of the underground workings.

20,651. Do you not think that it would be very desirable that it should be enforced that all parties should keep plans of mines?—I think that it ought to be done.

20,652. So as to be accessible in case of workings being renewed?—Yes; every mine which is abandoned should have a complete plan.

20,653. There should be a place of a deposit for plans?—Yes.

20,654. In fact, if there had been a working plan of the old mines left, this accident never would have occurred?—It could not have occurred. We keep up our plans.

20,655. As far as working plans go of the modern workings, are they generally adopted throughout this country?—No, they are not, as far as I see.

20,656. (*Sir P. Grey Egerton*). How do the miners get access to these workings?—By means of a footway furnished with ladders.

20,657. Are the ladders very steep?—No; they are on the vein generally speaking; there is an underlay of about two feet in a fathom.

20,658. Are they wood or iron?—Iron and wood. We put in iron staves every new one that we make.

20,659. Are these the old ladders which you purchased with the rest of the plant, or are they new ladders?—Some of them are old ladders which we found in the mine.

20,660. Do you find that those old ladders are serviceable?—They do very well till the staves get worn out, and then we put in iron ones.

20,661. Then when there is any appearance of a stave being unsafe, you replace it?—We replace it directly.

20,662. When the men come to the surface do they change their clothes?—They do not, generally speaking, here.

20,663. Have you any dry provided for them?—Yes; we have three houses, but they generally come from home in their underground clothes.

20,664. Do the men prefer going home in their dirty clothes rather than taking the trouble of changing in the dries?—They, generally speaking, adopt the colliery principle of walking in their underground clothes. Some of them change at the mine.

20,665. (*Mr. Leveson Gower.*) Have they far to go?—They live almost close to the mine.

20,666. (*Sir P. Grey Egerton.*) Do you find that colds and coughs are prevalent here?—They are not.

20,667. (*Mr. Holland.*) Do they generally put on any over clothing when they have their mine dress?—They are generally pretty well clothed, and have pretty good shoes.

20,668. (*Sir P. Grey Egerton.*) About what distance have they generally to walk?—They live within a mile.

20,669. (*Mr. Holland.*) Do they generally use a separate footway, and not the one in the engine shaft?—Yes.

The witness withdrew.

RHEWL MINE.

JAMES GODDARD examined.

20,670. (*Mr. Kendall.*) You are a working miner?—Yes.

20,671. Do you only work in this mine?—Yes.

20,672. You have a share in this mine?—Yes, a small share.

20,673. How many shares are there?—16.

20,674. How many have you?—One share out of 16—an ounce.

20,675. Are they all divided between 16 poor miners?—No, they are from Liverpool, Staffordshire, and Birmingham.

20,676. This is not quite a poor man's mine?—No.

20,677. But several poor men work here?—Yes.

20,678. How do you manage about collecting money when a call is made?—They pay what they have to pay, and we are in loss afterwards. We work out our shares.

20,679. When they pay cost, you work up your cost?—Yes.

20,680. How do you work; by the month?—By the yard.

20,681. Who sets the work to you?—The man over the other party.

20,682. How often do you balance your accounts?—Every month.

20,683. And sometimes you have very little to receive?—Yes.

20,684. And a great deal of your money goes towards your cost?—Yes.

20,685. Are you raising any lead now?—Yes, we have very good lead.

20,686. How many tons do you raise a month?—We have just come to it.

20,687. And you hope to follow it now?—Yes; it will pay us now.

20,688. What is the width of the lode?—About a yard or four feet in some places.

20,689. How many tons will it turn out to a fathom?—I cannot tell.

20,690. Have you a rich vein now?—Yes, very rich.

20,691. And you hope to make money now?—Yes.

20,692. As I understand, you have no stage or resting place from the surface till you get to the bottom of your mine?—No.

20,693. What is the depth?—120 feet.

20,694. Then you have to go up and down 120 feet without resting?—Yes.

20,695. Have you ever have any accident?—Never.

20,696. The ladders are all safe and tight?—Yes.

MOLD.
J. Goddard.
17 July 1863.

20,697. Where were the ladders made ?—In Halkin.

20,698. Do you find it fatiguing to go that depth without stopping ?—No, I think not.

20,699. Do you ever buy a second ladder ?—No.

20,700. How is the air at the bottom of your mine? —Very good indeed.

20,701. You have a funnel at the top, and it is found to be good all the way down ?—Yes.

20,702. How far from the bottom of the shaft is the end ?—About 10 yards.

20,703. How many ends are you driving ?—Only one.

20,704. On the course of the lode ?—Yes, west.

20,705. Does your candle burn well ?—Yes, capitally.

20,706. And I suppose you turn your funnel against the wind ?—Yes; it will turn in a minute.

20,707. If it is a very calm day, with no air at all, do you find any difference then ?—Yes, a little; not much.

20,708. Ho long do you think you shall drive before you have another shaft ?—We have put it out about 40 yards off.

20,709. Have you pitched it?—No, but we are very near.

20,710. How many men have you working at a time ?—Two.

20,711. Do you work six hours at a time ?—Yes; we have six men.

20,712. Then you have six hours rest ?—Yes.

20,713. (*Mr. Holland.*) Is the mine quite dry ?—Yes.

20,714. (*Mr. Kendall.*) Who draws your water for you ?—Nobody; it takes itself off.

20,715. Where do you think it goes ?—We have what we call a swallow taking it also.

20,716. Have you a swallow close by ?—Yes, within 15 yards of the shaft.

20,717. How long is it since you cut the vein ?—Eleven weeks.

20,718. Is there any blasting ?—No.

20,719. It is all pick work ?—Yes.

20,720. Does either of the miners working here work at any other mine ?—Not now, but they have been.

20,721. Do you know any men who work some time in the day in a regular mine, and then work at their own mine afterwards ?—We have been so.

20,722. What was your last call ?—16*l.*; 20*s.* a share.

20,723. Did you work up your 20*s.* ?—Yes.

20,724. Did you work it up all at once ?—No.

20,725. You did it by degrees ?—I have to pay my call every month.

20,726. You work up your call every month ?—Yes.

20,727. And you receive the difference ?—Yes.

20,728. Supposing at the end of your month you had earned 5*l.*, you would only receive 4*l.*?—Yes.

20,729. When poor men have these mines there is no overlooker or captain, is there ?—Yes; there is a man to look over.

20,730. You appoint a man among yourselves ?—Yes.

20,731. Is he a working man also ?—Yes.

20,732. Generally, when poor men have works of their own, they are their own masters; there is nobody to interfere with them; it is their own property, and there is nobody to say that they shall do this or that ? —Just so.

20,733. (*Mr. St. Aubyn.*) They can change their captain whenever they please, cannot they ?—Yes.

20,734. Has he anything extra for being overlooker ?—Yes.

The witness withdrew.

HOLYWELL.

Dr. JESSE CONWAY DAVIES, of Holywell, examined.

HOLYWELL.
Dr. J. C. Davies.
17 July 1863.

20,735. (*Chairman.*) I believe that you are a member of the College of Physicians of Edinburgh ?—Yes, and of the College of Surgeons of England and of the Apothecaries Company, and a Doctor of Medicine.

20,736. Have you practised long in this locality ?—Ten years, I think. I was House Surgeon to the Dispensary here for three years before that.

20,737. During your practice have you had under your care any men who were working as miners ?—Constantly.

20,738. Have you observed that they are affected in any different way from other classes ?—Yes; we find that they are affected with what we call the miners' asthma.

20,739. Do you observe that in its incipient stage; how does it first develop itself ?—Very often it comes on like the symptoms of chronic bronchitis; at other times it comes on with symptoms of affection of the heart—enlargement of the heart.

20,740. Should you consider that the lives of the miners are shorter than those of men in other employments; that their lives are shortened by their occupation ?—No doubt of it.

20,741. In cases which come to you have you ever observed them get perfectly free of it; do they recover completely ?—No, not if they have been working in mines for some years; but if they have only been for a few years, from seven to ten years, and they are recommended to change their occupation altogether, and do so, then they get free from it.

20,742. But if they persevere in their occupation they seldom recover ?—Just so; miners generally calculate upon working for twenty years; they say, "If we do not continue at it much more than twenty years we may escape." But it is not often that a miner escapes entirely; at least that is my experience.

20,743. (*Mr. Holland.*) Do a very small proportion of them escape if they work twenty years ?—As far as I can recollect and call to memory there are very few indeed who escape if they have worked for twenty years.

20,744. If they work steadily on for twenty years as miners ?—Yes, and some of course suffer much earlier than that.

20,745. At about what age do they generally begin decidedly to fail in health ?—If a miner has been working in a mine from childhood then he will not go very much beyond 40 before his health fails.

20,746. At what age do they generally begin working underground ?—They go as soon as they are able to do anything.

20,747. At 16 or 18 ?—Earlier than that.'

20,748. They work underground younger than that ? —Yes.

20,749. (*Chairman.*) Have you any cases at present which could be seen?—No; I have made inquiry since I saw your lordship, and it so happens that I have not at the present moment any case. If the inquiry is to be extended over some short period then I am sure that I could produce cases. I intend making post morten examinations as early as an opportunity is afforded me, and also as often as I can meet with subjects, so that I might arrive at the true pathology of the disease.

20,750. (*Mr. Holland.*) To what cause do you attribute the miners' asthma chiefly ?—I fancy myself that it must be a complication.

20,751. What are the complications ?—It is com-

plicated with emphysema, enlargement of the heart, and bronchitis.

20,752. To what circumstances attending their employment do you attribute these complaints chiefly?—To the want of oxygen.

20,753. Poor air?—Yes; bad air in the mine.

20,754. Do you think that they breathe sufficient udst to produce much irritation of the membrane?—No, I think not.

20,755. Do you attribute much to powder smoke?—No, I do not think that the men do.

20,756. Do you think that much of the mischief is to be attributed to coming out of the mines hot and getting cold?—That is the case sometimes; it produces a cold, and with those who are at all prone to congestion of the membrane it will produce bronchitis. Of course that will assist; and I think that it is bad air, the want of oxygen. The blood is not thoroughly decarbonised, and therefore the pulmonary circulation must be retarded in consequence; and there is a tendency to congestion of the mucous membrane of the air passages and of the lungs, and then a greater work is thrown upon the heart, and an enlargement takes place.

20,757. Are a large number of the men ill before they apply for medical aid?—Yes, very often; in fact the miners consider, when they get 45 or 50, and begin to feel a difficulty of breathing coming on, and a cough and expectoration, and so on, "Well, it is the miners' complaint." They suffer considerable distress, but they do not apply for medical aid.

20,758. We were told at Wrexham that the miners were in the habit of considering their complaint incurable, and that they bore with it; that is the case here?—Yes. If they have a medical man that they can go to, if there is a club belonging to the mine, then of course they very often go; but they consider generally among themselves here that if once they are affected with miners' asthma it is incurable.

20,759. Have you noticed that miners are more liable to phthisis, true consumption, than other men?—No.

20,760. (*Mr. Leveson Gower.*) Do you attend any colliers?—Yes.

20,761. Is there any mining disease among them?—No, we do not observe much here.

20,762. Have you ever seen a case of it in a colliery?—No, I never saw a case among colliers here of the black expectoration, or anything of that sort; nor have I seen any cases where I could say that they were suffering on account of working in collieries.

20,763. To what do you attribute the difference; better ventilation?—Yes. Collieries are much better ventilated than mines generally.

20,764. (*Sir P. Grey Egerton.*) I think you stated that the miners' disease sometimes originates in cold?—Cold very often assists, and may prove a serious complication.

20,765. As far as you have had an opportunity of observing, are the miners a careful set of men or not, as to changing their clothes when they come out of the mine; do you think that they take the necessary precautions to avoid catching cold?—I think so.

20,766. Is it the general habit of the miners here to change their clothes when they come to the surface before walking home?—Yes, generally, especially in large mines.

20,767. Are proper places provided for them for changing?—Yes, generally.

20,768. Have you visited the dries, as they are called?—Yes.

20,769. Do you think that they are adapted for the purpose?—Yes, I think that they are.

20,770. Do the adventurers supply the miners with water to wash in the dries when they come out of the mine?—I could not say that. I have not made inquiries into that.

20,771. Is it your opinion that if proper places were provided, and the men took advantage of them, it might obviate the predisposing cause of the miners' disease, as far as catarrh is concerned?—Yes, decidedly. There is no doubt about that. Dyspepsia follows miners' asthma on account of the congestion of the stomach and liver which takes place, and often also of the kidneys, producing albuminuria. The postal system is frequently implicated, and the patient has hemorrhage often from the bowels, and piles is a common complication.

20,772. (*Mr. Holland.*) Are miners unusually liable to dyspepsia?—No, I do not think that they are particularly.

20,773. Are they unusually liable to rheumatism?—No, I do not think that they are. I think that farmers' labourers are more liable.

20,774. Miners are not remarkably so?—No.

20,775. *Mr.* (*Leveson Gower.*) Do you see any difference in the health of the miners in the different mines; do you consider some mines more unhealthy than others?—As regards the mines which are badly ventilated, if foul air or the want of oxygen predisposes to pulmonary congestion and so on, of course the worse the mine is ventilated the worse it is for the miner.

20,776. Have you had more cases from certain mines than from others?—I could not say so as regards any of the public mines; but small mines, small ventures, and so on, where, perhaps, four or six men are working in their own mine, are, I think, the worst ventilated. There was an instance here the other day: two men were working in the bottom of a shaft, but the air was very bad, so that they could hardly breathe, but they had heard from somebody that if they had a stove in the shaft it would cause a better ventilation, and they took a stove down to the bottom of the shaft, and of course it had not been there above three or four minutes before they both fell senseless at the bottom of the pit.

20,777. (*Mr. Holland.*) Do you mean a stove without a flue?—I do not know what kind of stove it was. Of course that destroyed the oxygen, and converted it into carbonic acid gas at once, and the men could not breathe, and they fell senseless. Of course the fire went out directly that the oxygen was exhausted. I suppose that it must have been the heat from the stove that caused a little disturbance in the air of the pit, so that oxygen replaced some of the foul air where the men lay, or otherwise they would both have been dead.

20,778. (*Mr. St. Aubyn.*) Have you been able in your practice as a medical man to distinguish amongst your patients those who have worked in the large mines, and those who have worked for small adventurers, so that you could speak from your own experience as to the relative healthiness of those who work in the small and those who work in the large mines?—I know as a fact that those who work in the small mines suffer more.

20,779. Have you found that from your own experience?—Yes, I am positive of it.

20,780. In what particular forms of complaint are those who work in the small mines less healthy than those who work in the large mines?—They become more liable to miners' asthma.

20,781. Are they attacked at an earlier age, or when the disease attacks them is it in a worse form?—Whatever gives a tendency to it is increased. In a badly ventilated mine, of course, the miners will suffer more.

The witness withdrew.

Mr. JAMES WILLIAMS, Surgeon, of Holywell, examined.

20,782. (*Chairman.*) Have you been for a long time practising at Holywell?—In my own practice I have been here since 1851—12 years; but I had been here with my father all my life previous to that.

HOLYWELL.
Mr. J. Williams.
17 July 1863

20,783. So that you know the district well?—Yes. I was bred and born here.

20,784. During your practice have you many men who are working in mines who come to you for advice?—Yes, a large number.

20,785. Do you find that there is any disease peculiar to miners?—Yes; they are all very liable to what is commonly called asthma. Here the thing is proverbial, and they call it the miner's asthma.

20,786. You refer to those in the metal mines?—Yes, lead miners; not colliers.

20,787. At about what age should you say that they die?—They all die what is called young; some of course live to a greater age. I never made any average of any sort, but I should say at a guess perhaps 45 to 50.

20,788. Do they come to you at the commencement when they first feel affected?—No; as a rule it comes on very insidiously and quietly; the symptoms, at the commencement, not being so urgent as to prevent their going on with their work.

20,789. Have you any case where a man has recovered?—No, I do not know of an instance.

20,790. They still continue working?—Yes. Their bodily health, as a rule, in other respects is good,—they are simply short-winded.

20,791. In your opinion does that render them liable to other diseases of the chest?—Yes; it commences as a case of asthma, and eventually ends in dropsy, or it brings on consumption or chronic bronchitis.

20,792. In case of death, under what disease do you suppose that it would be registered?—I should say that the majority of them would be registered as cases of asthma.

20,793. They would not be registered as phthisis?—I should think not, except, perhaps, those cases which end in phthisis.

20,794. Is there any register of any kind which would give information with regard to the proportion?—Yes. I happen to be Registrar of Deaths, and I have no doubt I could furnish you with tolerably correct information on the subject.

20,795. Will you have the kindness to do so?—I shall be very happy to do so. The register book in my possession begins in March 1862, and from that date up to the present time there have been 16 deaths of lead miners. I just went over the causes of death, and three out of the sixteen have died from other causes than disease of the chest; therefore 13 out of the 16 have died of disease of the chest, principally asthma, chronic bronchitis, and phthisis.

20,796. (*Mr. St. Aubyn.*) I think you said that you had never known a case in which a man has recovered from this miners' disease?—I have not.

20,797. Do they consult you in the earlier stages of the disease, or do they let it run on till it gets too far?—They let it run on until it incapacitates them from following their work; they then, perhaps, apply to a medical man, and when they get better they resume their work.

20,798. If a man who was attacked with this disease was to consult you in the earlier stages of it, and then was to take some other occupation, such as an agricultural life, do you think that it would be incurable in that case?—I am hardly able to give an opinion upon that point; I have never tested it, but I do not think that the disease could be cured by such means. It perhaps might be suspended for a length of time.

20,799. Have you been in the habit of going underground yourself?—No. I have not seen any lead-mine workings.

20,800. What, in your opinion, is the cause which induces this complaint?—I see no cause for it myself, except a man being habitually accustomed to breathe a vitiated and close atmosphere, which is also, perhaps, well charged with dust and powder smoke.

20,801. Do you think that anything arises from climbing the ladders; does it affect the heart in any way?—I think not. In this district there is very little climbing, for the mines are not of a great depth; and, from what I have heard about mining, the ladders are short, and then, perhaps, there is a little incline, and they walk it, and then there are the ladders again. There are other occupations in life where there is a great deal more climbing; sailors, for instance. I do not think that that will be found to bring on asthma.

20,802. Have you seen the places where the men change on the surface?—Yes.

20,803. Are they sufficient for the purpose; do they always get dry clothes on when they come up from work?—Yes; they are dry for them.

20,804. You do not think that keeping their wet clothes on, or exposure to the air when they come up from the mine, has anything to do with the disease?—It has a tendency to bring on colds.

20,805. If they do so?—Yes.

20,806. But it is the habit in this district to do so?—A great many do, I think; I often see men walking about in their wet clothes.

20,807. Then you would say that, that as well as the bad air, would affect them?—Yes; but that of itself would not necessarily bring on asthma; it would give them a cold, and there would be an end of it. If a man has worked in bad air, and he is subject to asthma, remaining in his wet clothes would develop it.

20,808. (*Mr. Holland.*) Is this disease which you call miners' disease quite distinct from common consumption?—Yes; I look upon it as a different disease altogether; the symptoms are different, and it is in fact of a different character.

20,809. What do you think it is chiefly?—It begins as asthma. I should say that it was emphysema of the lung, complicated, perhaps, with chronic bronchitis.

20,810. When do you think that bronchitis comes on?—It comes on in consequence of accidental circumstances, I suppose. I look upon the disease as beginning with pure asthma, but from accidental circumstances it may go on into chronic bronchitis or phthisis.

20,811. Is there much complication of heart disease with it, in your opinion?—No, not often.

20,812. Do the miners complain much of dust as an irritating cause?—Yes, they complain a good deal of dust.

20,813. Is there much difference as regards the irritation from dust in different kinds of mines?—Yes, according as the mine is wet or dry.

20,814. Do they complain much of powder smoke?—Yes, they complain a good deal of powder smoke.

20,815. Do you think that the exposure to cold after working is an important cause of the disease?—It may help to bring it on, to develope the thing more decidedly, but I do not think that it would bring on this peculiar disease of itself.

20,816. Do they complain of their great liability to catch cold?—No, they do not complain so much about that. They expose themselves very unnecessarily, I think, sometimes. They say that they prefer working in a wet place to a dry one; that is my experience of them.

20,817. Is that because they have less dust?—Because they have less dust and smoke. They consider it much more wholesome.

20,818. Then it would seem as if the dust was more injurious to them than the damp?—I put that question to many of them, and they do not consider that the dust brings on their disease, but that it irritates them very much, and is a great nuisance to them. I have asked several very intelligent and experienced men about it, and they all say that the thing which injures them is the bad air,—being obliged to work in places where their candle will hardly burn.

20,819. Do you think that if they could be induced to wash themselves or bathe after coming out of the mines they would be less liable to catch cold?—I hardly think that they would. I think that if they took off their wet clothes, and put on dry ones, and walked home in dry clothes, they would be tolerably safe; but I should say that walking home in wet clothes is decidedly bad.

20,820. (*Mr. St. Aubyn.*) You have spoken of the

men complaining to you that they have been obliged to work in places where the candle would not burn?—Yes.

20,821. Is that a frequent complaint?—Yes. I spoke to half a dozen different men a few days ago, in different parts of the district, and they said the same thing, that they had frequently worked where the candle would only just burn and give light.

20,822. Did they say that they were obliged to work in such places?—That they went on working.

20,823. Where the candle went out or where it burnt badly?—Where it scarcely gave any light.

20,824. Was this in the Halkin district?—Yes, Halkin and Ysceifiog.

20,825. Did you gather from what the men told you that the overlookers were aware of the fact?—Yes; but I believe that it is a custom of the country, and I do not believe that the men think much about it; they seem to look upon it as a thing to be done.

20,826. It is a common practice?—Yes, decidedly, from what I hear.

20,827. (*Mr. Leveson Gower.*) Do you know of any lead mine where those who are working in it are generally free from miners' disease?—No.

20,828. Is the disease alleviated or retarded by medical treatment?—It has not much effect upon it, I think, except that it alleviates an occasional attack sometimes. They are worse at times than at others; but the moment they get a little better they go back to their work, and they are just in the same plight.

20,829. In fact it is only cessation from work which relieves them?—Yes. I do not know of anything else which would cure it.

20,830. (*Mr. Kendall.*) I suppose that they are bad patients; they come very late, and if there is the least improvement they go to work again?—Yes.

20,831. They ought to come to you before, and when they do come they do not take care of themselves?—Yes.

20,832. (*Mr. Leveson Gower.*) Are their wages low?—The work is very precarious; I believe they average about 15*s.* per week; but sometimes they make more or less, according to their contract with their employers.

20,833. In the course of the year do not they get higher wages than the agriculturists?—Yes, I should say they do.

20,835. Are they an improvident set?—As a class I do not think that they are improvident; but only getting wages about once a month they have no notion, I think, of laying them out to the best advantage.

20,836. Are they generally sober?—As a class I don't think they are regularly intemperate. When they receive their monthly pay they may perhaps have a drinking bout; but I don't consider them systematically drunkards.

HOLYWELL.
Mr. J. Williams.
17 July 1863.

20,838. Have you seen any improvement in that respect, or in their condition, since you first knew them?—I am told that they are improved in that and every other respect in the last 20 years.

20,839. (*Sir P. Grey Egerton.*) I think you have stated that consumption is not uncommon amongst the miners?—No; it frequently comes on.

20,840. Have you ever met with a case of true phthisis being a consequence of the miners' disease where the constitution of the man or of his family has not been of a phthisical diathesis?—I cannot call to mind any particular instance of that sort, and I should myself almost think that it would require a consumptive diathesis to develop the disease in a miner.

20,841. The mischief to the lung tissue in the miners' disease is not necessarily tuberculous?—Exactly; that is what I mean.

20,842. But it is rather an induration or hepatization of the lung?—It is an emphysematous state of the lung.

20,843. Have any of the cases which you have attended been complicated with the black expectoration?—I do not remember any well marked case.

20,844. Whence do you think that that colouring matter arises?—It is supposed to arise from the inhalation of smoke, coal-dust, or other carbonaceous matter.

20,845. Then if that be so, it is not peculiar to miners' asthma?—No, I do not consider it so at all.

20,846. Therefore the occupation of a miner does not render him more liable to the black sputa?—No, I should say not so liable as that of a collier or other workman more particularly exposed to smoke or coal dust.

Return of ages and causes of death of lead miners in the parishes of Holywell, Halkin, and Ysceifiog:—

Number of deaths from all causes - -	112
Proportion of deaths from diseases of lungs	76
Average ages at death, from all causes -	52
„ „ from diseases of lungs	50

The diseases of the lungs are nearly all of a chronic character,—asthma, chronic bronchitis, œdema, phthisis, &c. Not more than 6 out of the 76 are of an acute character.

The witness withdrew.

Adjourned to To-morrow at Rhyl.

RHYL.

Saturday, 18th July 1863.

PRESENT:

The Right Honourable Lord KINNAIRD, K.T.	NICHOLAS KENDALL, Esq., M.P.
Sir P. GREY EGERTON, Bart., M.P.	JOHN ST. AUBYN, Esq., M.P.
The Honourable E. F. LEVESON GOWER, M.P.	P. H. HOLLAND, Esq.

The Right Honourable Lord KINNAIRD, K.T., in the Chair.

TALARGOCH MINE.

Captain WILLIAM BOWEN examined.

20,847. Of what mine have you charge?—Talargoch Mine.

20,848. Have you charge of any other mine?—No.

20,849. What is the ore of the Talargoch Mine?—Lead principally.

20,850. Is there much silver?—From 10 to 12 ounces in a ton, in some parts of it 7 or 8; there is also blende.

20,851. Do you meet with any other description of ore?—A little copper sometimes, but not to pay.

20,852. About how many men have you working under ground?—About 300.

20,853. Are there any boys among them?—No, we have none less than from 15 to 16 or 18.

20,854. How do the men ascend and descend?—By ladders.

RHYL.
Capt. W. Bowen.
18 July 1863.

RHYL.

Capt. W. Bowen.

18 July 1863.

20,855. How many shafts have you to the service?—We have 12 shafts.

20,856. Do the whole of the workings communicate under ground?—Yes.

20,857. What is the deepest level at which you are are now working?—220 yards.

20,858. Are you sinking there still?—No, we have stopped for the present; we shall commence driving out. We are putting a lift down.

20,859. You are driving from the 220 yards?—Yes.

20,860. Are the men working mostly by tribute, or by tutwork?—They are getting ore by tribute, and doing the yard work by tutwork.

20,861. Do you know the proportion of men on those two descriptions of work?—Yes. I should think that about half are on yard work, and the other half on lead ore.

20,862. Is there much blasting?—A good deal in some places.

20,863. Have you any accidents from blasting?—None whatever; there was one man hurt here a good many years ago but there has been nothing in my time.

20,864. How many hours do the men work?—Six.

20,865. Do they relieve at the surface?—Very near the surface, they meet one another about half way.

20,866. So that they do not actually work the whole six hours?—No they do not work above five.

20,867. What allowance of candles have the men per week?—A pound and a half or two pounds, just according to the difficulties,

20,868. What are they charged for the candles?—Just according to the price of them; 7*d.* we charge them now I think.

20,869. And how much for powder?—About the same price.

20,870. Do the men live near here?—Some of them live close by, some live a good way off.

20,871. Have they any other work, agricultural or otherwise?—We do not allow them to work in mining elsewhere, but if they like to do something on the surface for their own good they are quite welcome to do it. We do not allow them to go under ground in any other place.

20,872. Do you know how the men employ themselves at home?—Some do nothing, and some attend to their gardens and just attend a little to their family affairs, nothing more; some will take a little job by which they get 4*d.* or 6*d.*, or half a day's work.

20,873. Where do the men change when they come to the surface?—In the cabins here.

20,874. Do they change in the boiler house?—No, we do not allow them to go there.

20,875. You have rules against it?—Yes, they are not allowed to go there unless sometimes their clothes are very wet, and they cannot dry them quick enough, and a man goes to lay them there and fetch them from there. We have a cabin here heated with pipes coming underneath the boiler.

20,876. Do they change their clothes when they come up?—Yes, in the cabins, but not in the engine house—they dare not go there.

20,877. Do those who reside near change at home, or do they still change in the cabins?—A great many of them go home to change, those who are close by; they prefer going home to stopping here.

20,878.—But they have an opportunity of changing here?—Yes.

20,879. What distance should you say that a man residing away from the mine would go without changing his clothes?—About five or ten minutes walk I should think, when they work in dry places; but when they work in wet places they change their clothes before they start from the place; some of them are as comfortable on coming up, after working six hours, and as dry, as I am now.

20,880. Is it a wet or a dry mine on the whole?—Very dry, except just the lower level.

20,881. You have printed rules?—Yes.

20,882. When the men are engaged how do they see the rules?—We share them out; we give one to each corps.

20,883. Are they in Welsh as well as in English?—Yes.

20,884. Is there any doctor belonging to the mine?—No, they choose their own doctor; they prefer choosing their own doctor; there have been three or four doctors attending here. We have a place on purpose for the doctors to attend.

20,885. Is there any deduction for payment of the doctor?—The men pay themselves, quarterly.

20,886. Who collects the money and manages that matter?—The doctors themselves. There was a great dissatisfaction amongst the men—one was for one doctor, and another for another, and the secretary who was here before this gentleman could make nothing of them about the doctor's money as there was so much grumbling altogether—we therefore gave it up, and left them to pay their own doctor.

20,887. Do they pay any club money, or is there any other deduction?—Nothing whatever, but I sometimes make a collection among the men in cases of necessity when somebody is very bad and very poor.

20,888. Do you find the men willing to assist when you apply to them?—Yes, sometimes they are very good; we have collected some 5*l.* 6*l.* and 8*l.* here.

20,889. Except for the materials no deductions are made.—Nothing whatever.

20,890. Is there a bill showing the deductions?—Yes, pay bills.

20,891. How often are the wages paid?—Monthly.

20,892. How much do you keep in hand?—Our settling day terminates on the last Saturday in the month, and we pay them on the first Saturday after the second Thursday in the month. The sale of ore is on the second Thursday.

20,893. They are paid within a fortnight?—Yes, and sometimes less, and sometimes more; it is just according to how the month terminates.

20,894. In the bill which you have produced the doctor is printed?—Yes, but nothing is charged.

20,895. This is an old form?—Yes, we leave what we like out of it.

20,896. Do you pay in notes or gold or silver?—In silver and copper as much as we can for the convenience of the men, to save their going to the public houses, but in notes for tradesmen and so on. We mostly pay the men in gold and silver.

20,897. You think that that is a good plan?—Yes, the men settle on the surface, and it saves their going to the public houses.

20,898. (*Mr. Kendall.*) With regard to the men's houses, are they well accommodated in those houses or not?—They are very good, especially some of them, I think that on an average the houses are very good here.

20,899. Do they sleep two or three in a room, or how?—The whole family will sleep in two rooms, most of the houses have only two rooms.

20,900. Where do the unmarried miners lodge?—At home with their friends; I do not think that there are half a dozen lodging men in the place.

20,901. Most of the men who work in these mines are men who have worked here for a very long time or whose relations have worked here?—Yes.

20,902. They do not shift about much?—No, very seldom, and if they do they very soon come back.

20,903. What do you allow them to earn during the month?—15*s.* a week is our average rate, but they have been getting up as high as 100*l.* in a month. We let it at so much a ton. We say "You shall have 5*l.*, 6*l.*, 7*l.*, and 8*l.* a ton, and you may get as much as you like."

20,904. They sometimes get into a bunch?—Yes.

20,905. Taking the average do you think that they get more than 3*l.* a month per man?—Yes, it will do more than that all the year round.

20,906. Are the men here provident and sober, do they save money?—Many of them have saved a good deal of money.

20,907. Do they put it in the savings bank?—Yes; they have bought ground.

20,908. And have built houses?—Yes, several have gone very large farmers from here.

20,909. You have worked yourself in several mines; upon the whole were they better or worse ventilated than this one?—This is one of the best that I was ever in, this and Maes-y-safn Mine—it is now under the management of Mr. John Taylor, — the Maes-y-safn Mine and this are the two best ventilated mines I was ever in.

20,910. When you get near the coal here, have you not some gases sometimes?—Yes, there is some gas at the western end it smells a little obnoxious in this level, but the other part of the mine is quite sweet.

20,911. Do the men complain much of it?—Sometimes when it happens to come very strong.

20,912. Do they leave work or no?—No they get air; we drive and sink sumpts to get air on the levels.

20,913. Before you completely get a thorough draught of course they must suffer for some time; how do you manage then?—They cannot suffer but very little.

20,914. Why?—Because we have pipes and water falls.

20,915. When you find the air becoming close you have recourse to fans or water jets?—Yes.

20,916. Which do you use most?—We prefer water as it is more regular.

20,917. Taking an end where there is no gas, and an end where there is gas, how far in the end where there is no gas do you generally drive without having recourse to a water fall?—30, 40, 60 or 100 yards.

20,918. Do you find that you can go as much as 40 and 50 and 60 yards without inconvenience?—In some places you may go to 100 yards, and in another place you could not go 40 yards.

20,919. Can you account for the difference?—I cannot.

20,920. Can you go as far in shale as you can in lime?—No.

20,921. The moment you find that there is the least close air from whatever it may arise you at once have these appliances?—As quickly as possible always, we make a preparation for it before they have to complain.

20,922. How do you ascertain when it is close; what makes you find it out?—It will begin to feel warm and get more difficult; the candle will show in a moment if it is not good.

20,923. Is the candle your principal guide?—That and the smell; you can tell by the smell in a moment.

20,924. That is where there is gas?—Yes; and before there is gas, if the air is getting short you can tell by the smell as well as anything.

20,925. There is a closeness?—Yes.

20,926. Can you tell by the smell before the candle will guide you?—Yes; the smell will be unpleasant.

20,927. And injurious?—There is no doubt about that.

20,928. You can tell the smell when there is no gas?—Yes.

20,929. You also of course can tell it when there is gas; that is another kind of smell?—Yes. I could not tell the difference by the smell of fire-damp gas. I could not tell that it was fire-damp gas or what gas it was, but I should know that there was some kind of gas which ought not to be there.

20,930. You cannot distinguish between the different gases, but you are satisfied in your own mind that there is a certain gas there which is injurious?—Yes.

20,931. But apart from all these gases you think that in some parts of the east end where there are no gases you can distinguish before the candle will show that there is close air?—Yes.

20,932. You cannot describe what sort of smell it is?—No, it is impossible.

20,933. But it is a peculiar smell?—Yes.

20,934. You do not smell anything like it above ground?—No.

20,935. When you are talking of the close air which you can smell, does that arise from powder blast?—No, it may be in a place where you do not use powder at all, but as for the powder smoke I do not mind so much about that, that is not so injurious as the bad air; any person can tell when he gets into a fore-breast if it is beginning to get a little close, and especially if he is accustomed to go down.

20,936. (*Mr. Leveson Gower.*) He can tell from the smell and not from the difficulty of breathing?—It is not from the difficulty of breathing, for I have been working myself and I have been three or four months before we had any apparatus to blow, in mines where I have been in. I have told the captain, "There is beginning to get a little smell, we shall be short of air very soon." He has said, "We will make preparations and have air quickly."

20,937. (*Mr. Kendall.*) As I understand, the moment you anticipate any difficulty at all with regard to air you have your appliances all ready?—Yes.

20,938. Are those appliances expensive or not?—Sometimes they are very expensive.

20,939. Take your 140 yards level; supposing you are near a shaft, and you want to put an apparatus near the shaft, and want to blow 40 yards, what will it cost you?—It will take from 30*l.* to 40*l.*, I have no doubt, with timber and sawing and nails, and putting them in their places, and everything. It is just according to the size that you make the pipes. For 40 yards only it would not cost so much as that, but you would get three or four baulks, and cut them up to make air pipes. It is according to the size and thickness and strength of the air pipes. You would get very little timber for 15*l.* or 16*l.*, and then there is the trouble of sawing them, and measuring them, and putting them up in their places. They will not go very far.

20,940. Will it cost from 25*l.* to 30*l.*?—No, I should think not. All the timber would not go for that purpose. The cost would be reduced by using them in other places.

20,941. The cost would be reduced, inasmuch as when a communication was made, you could apply the wood for other purposes?—Yes.

20,942. The actual fan itself, and I suppose the box for the water jet, and so on, could be conveyed elsewhere?—Yes.

20,943. Do you ever use zinc instead of wood?—No, we have had no zinc here. We did not get the pipes large enough. We had some four-inch pipes; but we have been taking them away, and putting in some eight-inch pipes.

20,944. You think that an eight or ten inch square wooden soller or pipe is better than a four-inch iron pipe?—Yes, better than three four-inch iron pipes. Iron pipes would be better, if you had a great pressure of air to force upon them, on account of their strength; but if you want air to go quickly with a slight pressure, the larger the pipe the better.

20,945. (*Mr. St. Aubyn.*) What is the general condition of the miners in this mine as regards their health?—Their health is very good.

20,946. Do any of them suffer from what is called miners' asthma?—Very few. There is only one that I know of who has left the mine for the last six years, and he is a very old man. His name is David Morgan. He has worked in the mine for a number of years.

20,947. He is the only man who has left the mine, since you have been here, on account of bad health?—Yes.

20,948. Have you any old men working on the mine?—Yes.

20,949. Have you many?—Yes.

20,950. Above 60 years of age?—Yes.

20,951. How many have you upwards of 60?—We have one 77 years of age. He is at home now. He had a slip, and hurt himself a little, or he would have been here.

20,952. Up to what age do they generally work in this mine?—They work up to 60 and 70.

20,953. As a rule?—There are some as old as that.

RHYL.

Capt. W. Bowen.

18 July 1863

20,954. As a rule, speaking roughly, if a man comes here to work when he is 18 or 20, how long will he continue to work?—He will work here for 40 years.

20,955. The mine, speaking generally, is very well ventilated?—Very well. I can safely say that it will be the best in England if we have a cross driven south; that is the only difficult place which there is, it will be through in a very short time.

20,956. (*Chairman.*) When you meet with gas how does it affect the men?—It is a little sharp on the eye, the same as if you were peeling onions or something of that kind.

20,957. (*Mr. Leveson Gower.*) Is the candle ever affected from bad air without your perceiving any smell at all?—We perceive the smell before it shows upon the candle.

20,958. You always do so?—Yes; unless it is from a man's carelessness that he does not take notice of it, it is plain enough to be observed.

20,959. Is the candle ever effected by bad air without your perceiving any difference in the smell?—No I have never had it so; it is impossible that the air can be good in every place although the candle burns.

20,960. (*Mr. Kendall.*) Did you ever see the candle burning badly without your smelling at the same time that the air was bad?—No.

20,961. (*Mr. Leveson Gower.*) Then the candle is of no use as showing the badness of the air because you can always smell it without?—You can smell the commencement of it before it takes effect upon the candle. I have worked in several places where the air has been very bad, and the candle would burn very well, and we could do our work very well.

20,962. (*Mr. Holland.*) Is your mine pretty free from dust?—Yes, where it is a little damp, but where it is dry there is sure to be dust.

20,963. Is the dust chiefly in the limestone rock?—Not so much; by boring there is a little dust, but we put water in to cure the dust.

20,964. Then the men are not much annoyed by dust?—No, very little.

20,965. Do the men work much in chert here, is there much chert?—A little at the east end.

20,966. Are they annoyed by dust there?—About the same as in the limestone, because they use water there too, and as you get a little deeper in the ground, there is a little dampness, so that the dust cannot fly about.

20,967. Is the water quite effectual in keeping down the dust of the chert?—Yes, if you get water in the hole you will have no dust, unless it is a hole in the roof, and there you cannot get any water in, you must chance that.

20,968. (*Sir P. Grey Egerton.*) Are your rules and regulations strictly enforced?—We do not enforce them very strictly; we do not press upon the men too hardly; as long as they will behave themselves and attend to their work, we very seldom interfere with them; we ask them to come and do a proper day's work, and they do as they like.

20,969. When you do enforce the rules, what means do you take for that purpose—by fines or dismissal?—We very seldom make them pay; and if we do we keep it just to pay the doctor, or something of that sort.

20,970. I see that for certain transgressions there are fines enforced?—Yes.

20,971. How do you apply that money?—We have never had any money for anything except for drinking—a few half crowns—and then we pay it over to the doctor, or give it to some of the men who are sick or have been crippled in the mine, and so on, if they are poor.

20,972. I see that by the first rule the men are obliged to relieve one another at their place of work?—Yes, but they do not do it.

20,973. That rule is not enforced?—No, nothing to compare to it.

20,974. I see that by another rule there is a fine of 2*s.* 6*d.* for any man drying his clothes in the engine or boiler house; is that rule enforced?—Yes; but we have had no occasion to enforce it; they dare not go there, for if they did go they would be in danger, worse than the fine, of losing their work.

20,975. In fact these rules and regulations are rather to frighten the men?—Yes, we seldom fine them for anything, we only give them a good scolding and let them go.

20,976. As the men are not allowed to change their clothes in the boiler or engine-house, have you any means provided, by which they can dry their clothes?—Yes, we have a flue coming underground, and there is a damper to make it hotter or otherwise, as is necessary.

20,977. And you find that sufficient, so that the men find their clothes perfectly dry on coming up?—Yes.

20,978. Have you any water for the men to wash in?—They will not do it; we have provided a very good bath for the men, but not one of them will go into it.

20,979. (*Mr. Holland.*) Are your men as well lodged as the farm labourers in the district?—Better ten times over.

20,980. And they are not more crowded?—No, not so much I think, taking it in the long run.

20,981. Which get the best earnings, farm labourers or miners?—Miners.

20,982. Very much the best?—Yes, a great deal.

20,983. Are your men as healthy looking as the farm labourers of the district?—Yes, and better by half than one half of them, and the miners have less difficulty of breathing at this moment, taking them in the long run and taking the farmer labourers. I am quite sure that if you picked 800 men, or any number of men about the district, you would find the miners with better chests.

20,984. (*Mr. St. Aubyn.*) Take the case of a man who has been 20 years in the mine and a man who has been 20 years an agricultural labourer in this district, you say that the man who has been 20 years in the mine will be less subject to chest disease than the agricultural labourer?—Yes, I have no doubt of it, that with the farmers the men have more difficulty of breathing than in this mine.

20,985. (*Mr. Leveson Gower.*) About what are the wages of the agricultural labourers?—7*s.* a week and their meat; some get 10*s.* and some 11*s.*, and find themselves; we give 12*s.* to labourers, and to strong boys we give 10*s.* and 11*s.* and 12*s.* a week, and when they get to be 16 or 17 years of age we put them down.

20,986. Then are the miners better fed than the agricultural labourers?—I cannot say that, because there is a difference in the food; there is no doubt that the farmers servants food is good and strong, but they do not live the same—farmers servants eat butter and cheese, the miners are more for tea and milk and things of that sort.

20,987. (*Sir P. Grey Egerton.*) You have stated that your artificial ventilation is by means either of fans or of water falls?—Yes, when it is required, but it is very seldom required.

20,988. But when you use artificial ventilation, you use either fans or water falls?—Yes.

20,989. Do you find that very expensive?—The water falls are not so very expensive, there is only the expense of making the air pipes.

20,990. Did you ever try ventilation by means of a furnace?—No, we could not get it to act here.

20,991. Why do you think it would not act?—Because it is not like a colliery, the air would be tumbling up and down first one way and then another, and perhaps it would kill all the men in the mine.

20,992. Is the upcast always upcast and the downcast always downcast?—No, it changes perhaps six or eight times in a day sometimes.

20,993. Then according to that a furnace would not be more variable in its action than your present ventilation?—I do not think that a furnace would act at all unless we had only two shafts to keep the current regular.

20,994. You have never tried it, at all events?—No, we never had any occasion to try it.

The witness withdrew.

Adjourned to Monday next at Llanrwst.

LLANRWST.

Monday, 20th July 1863.

PRESENT:

Sir P. Grey Egerton, Bart., M.P.
The Hon. E. F. Leveson Gower, M.P.
Nicholas Kendall, Esq., M.P.
John St. Aubyn, Esq., M.P.
P. H. Holland, Esq.

NICHOLAS KENDALL, Esq., M.P., in the Chair.

COED MAWR POOL MINE.

Mr. Edwin Aspinall Beech, of Gwydyr Ucha, Llanrwst, examined.

20,995. (*Chairman.*) This mine is on the property of Lord Willoughby ?—Yes.

20,996. And you are Lord Willoughby's agent ?—I am.

20,997. You do not interfere at all with the mining operations here ?—Not at all.

20,998. Saving granting sets ?—Just so.

20,999. Is this the largest mine on his lordship's property ?—It is.

21,000. What are the royalties ?—One tenth.

21,001. What is the term of the lease ?—21 years

21,002. Have you any other leases of mines besides these ?—Yes; and of quarries.

21,003. Slate quarries ?—Slate quarries and sulphur mines. We have a very fine sulphur mine on the estate.

21,004. That is from iron pyrites ?—Yes; it contains about 40 per cent. of iron.

21,005. Is that a sulphur mine or a sulphur quarry?—A sulphur mine.

21,006. What are the royalties there ?—2*s.* 6*d.* a ton.

21,007. Besides that, have you other mines let to poor men ?—Yes.

21,008. On what terms do you let to poor men ?—Exactly the same as we do to others.

21,009. For one tenth ?—Yes.

21,010. But not so long a lease ?—Yes; we give them a lease of 20 or 21 years, I forget which. We first of all give them a take-note of three years, and at the expiration of three years they are at liberty to take a lease or abandon the works.

21,011. How many have taken leases after they have had take-notes in the last 12 takes; half ?—More than half.

21,012. How long have you been agent here ?—I have been here about seven years.

21,013. From what you have learned, and from what you have known by your own experience, do you think that the letting of these small mines is advantageous or disadvantageous to the possessor of the soil ?—I think that it is a great disadvantage to the possessor of the soil.

21,014. Why do you think that it is a disadvantage ?—I think that the workings are spoilt by small takes, and having small miners—nothing but labouring men—working them. They have not the means of working them properly, and they grub the lead from the surface, and spoil the workings for large companies when they come in.

21,015. You do not think that they are pioneers for large companies, and make discoveries for them ?—They do in some measure.

21,016. Supposing that a poor man were to make a discovery, how would you manage unless you did give him a take-note ?—I cannot say, but I think he ought to be protected in some way.

21,017. But nothing of that kind has occurred as yet ?—No.

21,018. That is the system which you would recommend ?—Yes.

21,019. You do not speak as to the working of the mines at all ?—No.

21,020. Can you speak as to the health of the miners in the neighbourhood ?—I think that they are generally very healthy.

1,021. Do you mix up with their clubs at all ?—No.

21,022. Or their schools ?—We have three schools on the estate, but I do not interfere with them.

21,023. After a grant is made by you, whether to wealthy lessees or to poor men, the thing is out of your hands ?—No, it is not exactly out of my hands; we have a mine inspector, who visits the mines monthly, and he sends the reports in to me.

21,024. What is the object of the mining inspector; is it to see as to the ventilation, or to see as to the proper working of the mine as far as the lord is concerned ?—He looks to the royalty and the working, and reports the quantity of men employed in each mine. We take account of a mine which stops, and give notice to the lessees.

21,025. Supposing the men were working where there was bad ventilation, you would not interfere with it ?—No. We never have any complaint as to ventilation.

21,026. Then all that you look to is the royalty ?—Yes.

21,027. The object with you is money ?—Certainly.

21,028. And, provided a good royalty is paid, that is all you care about ?—Certainly.

21,029. (*Mr. Holland.*) Do you know the miners pretty well ?—I know many of them.

21,030. Are they a well conducted and steady class of men ?—Very.

21,031. Are they as well clothed and as well fed as the agricultural labourers ?—Decidedly better fed and better clothed.

21,032. Are they in the habit of having a drinking bout when they get their money pay ?—Very few of them; as a rule it is not so; they are very steady.

The witness withdrew.

Captain Matthew Wasley, of Coed Mawr Pool Mine, examined.

21,033. (*Chairman.*) You are the head agent of this mine ?—Yes.

21,034. Is it a limited liability company or not ?—Limited liability.

21,035. How long have you been agent here ?—Six years last June.

21,036. When you began this mine was it a new mine, or did you resume old workings ?—Old workings.

21,037. How old were the workings ?—I do not know. It appears that it had been worked, some say, in the days of the Romans; but this company, I believe, have had it somewhere about 11 or 12 years now.

21,038. When you came here how deep was the mine ?—The deepest level was about 25 fathoms from the surface at one place.

21,039. Have you any adit level ?—No.

21,040. How deep are you now ?—We are down more than that. There was only one part which was that depth; but the general bottom level was 15 fathoms from the surface.

21,041. What is the extent of the 15 fathoms level ?—There are different shafts, and it is from 15 to 20 fathoms each way from each ventilating shaft.

21,042. How many shafts have you ?—We have several shafts.

LLANRWST.

Capt. M. Wasley.

20 July 1863.

21,043. When you came here was the ventilation good?—No.

21,044. Where was it bad?—It was bad at the shaft called No. 2, and they went to the 15 fathoms and extended the levels, and there was only one shaft.

21,045. How far did they extend the 15 fathoms from that shaft?—About 30 or 40 fathoms.

20,046. Had they any jet of water or any air pipes at all?—No, there was no jet of water then.

21,047. Did you ascertain at that time that there never had been any use at all of jets or fans?—They had fans; we have the same fans here now.

21,048. After you came here you soon had a communication?—Yes; we had a shaft sunk from the surface.

21,049. At once?—Yes.

21,050. From that time to this have you had any bad air?—No; the air is very good.

21,051. What is the furthest end?—The 28 fathoms is our bottom level.

21,052. Are you driving from a sumpt shaft?—Yes. We are not two fathoms off from a winze.

21,053. How far are you off from a shaft?—About 10 or 12 fathoms. We are driving a cross cut from the engine shaft about seven fathoms. We cut the lode and we put a winze on the course of the lode; that is just as we came in.

21,054. So that there was no loss of time in getting good ventilation?—No. We prepared it all the way.

21,055. What size is your vein generally?—It varies from five or six inches to two or three feet sometimes.

21,056. Are these openings made by veins coming across, by feeders, or how?—There is generally a change in the strata.

21,057. What sort of country are you in now?—On the top, we have in some places a chert, or a trap rock, as some call it. In Cornwall it is called clay slate or capel, but here and in the lead districts it is called trap rock or chert. Then we have the elvin vein.

21,058. How wide is the elvin vein?—About 150 fathoms wide.

21,059. When it gets into the elvin vein how does it make?—It becomes more refined. There are bunches of ore; there is very little sulphur in the lode when you get into the elvin vein.

21,060. What is the produce in the elvin vein, compared with the other?—We have had some very good bunches in the trap rock, but the elvin vein is better; the ore is more refined, and a better produce.

21,061. What is the relative produce of the two?—That depends upon the market; we have made as much as 18*l.* of the elvin vein.

21,062. That is the price, but what per cent. of metal will there be?—I do not know that I can name the contrast between the two.

21,063. You are perfectly satisfied that your ventilation is good from beginning to end?—Quite so.

21,064. What number of men have you working under ground?—We have at present about 14 here.

21,065. How do you keep your water generally; by water wheel or by steam?—By lakes in the mountains.

21,066. You collect water when there is rain?—Yes.

21,067. And you have large reservoirs?—Yes.

21,068. I suppose the reservoirs now are pretty empty?—Yes.

21,069. How much water have you in the bottom?—About 20 fathoms of water.

21,070. What was the size of your lode in the bottom level when you left off?—About three feet wide.

21,071. How many tons of ore would it turn out?—About one ton to the fathom when we left off.

21,072. Have you any means of driving in from the valley, so as to tap the whole of the water underneath?—Yes. It might go out to the Bettws river; there are two palces; one at the south, and the other at the west.

21,073. Would that not be the way to work?—Yes.

21,074. But it would cost money?—It would certainly cost money, but it would drain all the property of the hills for miles round. We are draining the mines for miles round.

21,075. How much do you allow your miners to get a month?—About 3*l.* 6*s.*, 3*l.* 5*s.*, 3*l.* 4*s.*, and so on.

21,076. Are they mostly married men, or single?—A great many are married men.

21,077. Have they a club?—No.

21,078. They go to the doctor when they like?—Yes.

21,079. What is their health generally?—Pretty good.

21,080. Are they at all consumptive?—No.

21,081. Are you a Cornish man?—Yes.

21,082. Have you worked in Cornish mines?—Yes, nearly 300 fathoms deep.

21,083. In what mines have you worked there?—The Great Consols in Gwennap.

21,084. You have seen the hot mines?—Yes.

21,085. Did you suffer much yourself?—No; I was generally a tributer, and did not work in close ends.

21,086. Do you know any other mine in Wales besides this?—I never visited any mines in Wales but this.

21,087. Which are the healthiest men, the miners in Cornwall, or the miners here?—The miners here, because the mines are more shallow.

21,088. Taking a mine as shallow in Cornwall as here, which is the healthiest?—In Cornwall the adits are generally as deep as the mines are here.

21,089. Do you think that there is any other reason besides being a shallow mine why the men are healthier here?—It is possible to have a bad mine shallow as well as deep.

21,090. Do you think that there is any other reason besides being a shallow mine why the miners are healthier here than in Cornwall?—They are very steady in their habits; they are the most steady set of men that I ever came across. I have spent many years in Ireland and in Cornwall; but the men here are the steadiest men I ever met with, and the most honest men in their work, and in every shape and form.

21,091. They do not drink much?—No. I do not know that we have one drinking man in the mine. We have had 30 or 40 men in the mine, and I do not know that we ever had two drinking men who continued to work six months in the mine.

21,092. Are they lodged well?—Pretty fair. They live very convenient to this place. Generally speaking they are from this neighbourhood.

21,093. Do many of them sleep in the same room, or not?—I think not. They are generally distributed about on this property, or convenient to the place.

21,094. What is the largest amount of ore in the month that you have ever sold here?—About 20 tons a month.

21,095. How much do you sell to pay cost?—It would pay cost, and a little over.

21,096. (*Sir P. Grey Egerton.*) Are the men in the habit of changing their clothes when they come to the surface, or do they walk home in their mining clothes?—A great many of them who work in dry places walk home in their clothes.

21,097. Have you any place for them to dry their clothes?—Yes; and we keep a boy to watch the clothes.

21,098. Is the place heated?—Yes.

21,099. How many hands have you underground now?—We have about 14 now. When the water is out we have 20 to 25 and 30, and with those on the surface 40 to 50.

21,100. At what age do you take them underground?—There are no small boys working underground like there are in the West of England; they are generally men.

21,101. (*Mr. Holland.*) At what age do they begin?—I do not know that we have one less than 16 or 17 years of age. The reason, generally speaking, is, that they work more single-handed; in Cornwall they work more double-handed.

21,102. (*Sir P. Grey Egerton.*) Is it all blasting?—Not all, but there is only pretty fair blasting, it is

middling peaceable ground; it is, generally speaking, not high price ground, but low price ground.

21,103. Does much dust fly?—Not a great deal, because it is more of a damp nature.

21,104. Do you use water?—We use water in boring.

21,105. Do they bore single-handed?—Yes, generally speaking.

21,106. How long are your shifts?—Eight hours.

21,107. And how many?—In some places three corps, and in some places not more than two, and in some places not more than one.

21,108. Do they shift on the surface or below?—On the surface; but one place up and down is so shallow that they can get up and arrange their tools. It is not like the deep mines; they arrange their business to converse with each other about their future working.

21,109. Have you room in your ends for two men to work single-handed?—Seldom. They do work sometimes two, but where I speak of working single is in the stopeing ground, and not in the drivings.

21,110. Then in some places you work double?—Yes, where there is a wet driving, or a hard cross cut; we are driving a cross cut here where there are two men.

21,111. (*Mr. Leveson Gower.*) I understood you to say that the ventilation is better now than it was when you came here?—It is better, now that we have two shafts open, than when I came. I believe that the reason why they worked so contracted in their shafts was that this was a lake of water some years ago, and they went to a great expense previously to my coming here, and let the water off that lake. That is supposed to be the reason why they were so contracted in their shafts and openings. They were almost afraid to open anywhere previously to letting off the water from the lake.

21,112. Do you see any improvement in the health of the men, since you have been here, from improved ventilation?—When I went underground they were stopeing in the roof at the 15 fathoms; they were down to the 15 fathoms, and I thought that the air seemed rather of a sleepy and stupid nature. I said, "Where is your ventilation?" and they pointed out to me what they were doing in order to arrive at a certain point of ventilation. That was in Mr. Plumer's day; he was about to leave. I came in June; in July we sank a shaft which give us ventilation, and we put a footway. I came here on the 2d of June, and early in July we had a new shaft sunk from the surface, which gave new ventilation. That is all I know about the matter relative to the air being close. If that state of things had continued they would have been unhealthy of course. The men were looking rather stupid in the eyes; I know what bad air is, I can smell it.

21,113. Do you know anything about the state of the ventilation in the smaller mines in the neighbaurhood?—No. I work at another mine and our ventilation is good there. We are in about 15 fathoms, that is all at present, and another shaft is coming down from the surface now for ventilation.

21,114. You do not know of any case of bad ventilation in the neighbourhood?—I do not know any that I can name.

21,115. (*Chairman.*) You say that you can smell the bad air. Can you, from your experience as a miner, which I have no doubt is very great, smell bad air before the candle begins to flicker and to burn dull?—Yes. A practical man can smell the air, and tell that it is injurious.

21,116. Before the candle begins to show it?—Yes. A man will live for many hours where a candle will not live at all; a man can work in the dark.

21,117. Did you ever work in the dark yourself?—A little.

21,118. Upon a good pitch?—Upon a good pitch.

21,119. When you were a tributer, whenever you found the candle failing have you been so anxious to work that you have worked beyond your candle?—Yes. I have kept the candle behind. I have let it incline till it would run itself quite out, and then of course you must give up.

21,120. You felt that the air was very bad?—Yes. You can smell it and feel it.

20,121. How often have you done that in your lifetime?—Not much.

21,122. It is dangerous work?—It is very dangerous work, and I have done very little of it. I always fly from hot places.

21,123. (*Mr. Holland.*) Could you work fairly in such air as that?—No.

21,124. Could you do half work?—No.

21,125. (*Mr. St. Aubyn.*) Do you ever find the candle burn badly here?—No, except it is in a particular place, just before you hole a piece of ground, but not to continue. Our general working is in good air, the place being so shallow, we only being 28 fathoms down from the surface.

21,126. Generally speaking you, can always hold the candle upright?—Yes.

21,127. Are there any old men working here?—At present we have not many old men in the mine; we have one here between 50 and 60 years of age.

21,128. Up to what age do they generally work in this neighbourhood?—I do not know much about that.

21,129. Older than they do in Cornwall?—Yes, I suppose they do, generally speaking.

21,130. To what do you ascribe that; better ventilation?—To the mines not being so deep, and not so distressing to the lungs climbing up. They dwell more convenient to the mines here; they have not so far to walk, and the mines are not so deep, and there are many things.

21,131. There is better ventilation, and not so much climbing?—Yes. Climbing is very distressing; I have found it so.

21,132. (*Mr. Holland.*) What ventilating machines have you used here?—The fan and wooden pipes.

21,133. And a duck engine?—Yes, we have that now.

21,134. And a water blast?—We had a water fall for a little while over at the engine, and it worked very well; and we had a duck machine, or rather a large piston, which worked with the engine.

21,135. Which did you like best?—The piston with the engine worked very well, but there is nothing to beat the water blast.

21,136. Did you put in the ventilating machine before you wanted air to make the candles burn?—Yes. In fact we were aware that we must have it sooner or later.

21,137. Do you put it in before the candles show a want of air?—There may be a dullness in the smoke leaving the place after a blast. There seems to be a kind of cloud in the blast, and then we use it because the peat and clay lies very heavy in this valley. When we found the smoke to lie, though the candle burnt pretty fair we put in this piston with the engine.

21,138. Then before you wanted it to make the candles burn you put it in to clear away the smoke?—Yes.

21,139. Do you perceive the bad air take the strength out of you before the candles show it?—Yes; it will take the strength out of any person; a man will lose the power of his body before the candle shows it.

The witness withdrew.

Adjourned to To-morrow at Parys Mine.

ANGLESEA.

Tuesday, 21st July 1863.

PRESENT :

The Right Hon. Lord KINNAIRD, K.T.	NICHOLAS KENDALL, Esq., M.P.
Sir P. GREY EGERTON, Bart., M.P.	JOHN ST. AUBYN, Esq., M.P.
The Hon. E. F. LEVESON GOWER, M.P.	P. H. HOLLAND, Esq.

The Right Honourable Lord KINNAIRD, K.T., in the Chair.

PARYS MINE.

Captain WILLIAM VIVIAN, of Parys Mine, examined.

ANGLESEA.

Capt. W. Vivian.

21 July 1863.

21,140. (*Chairman.*) What is the name of the mine of which you have charge?—The Parys Mine.

21,141. What is the produce?—Copper.

21,142. How many men have you working underground?—About 230.

21,143. Are there many boys?—There are about 20 boys below surface.

21,144. What work do the boys do there?—They sometimes bore and blast, that is to say, they assist the men to do so, and they remove the ore and do such like general work as an assistance to the men; they are not very small boys.

21,145. What is the age of the youngest?—I should think they are about from 14 or 15 to 18.

21,146. Do the men ascend and descend by ladders?—Yes, by ladders and steps; ladders generally. Where it is very flat we have steps like stairs.

21,147. Where you are principally working, are you now driving or sinking?—We are more sinking immediately now; we have been sinking a shaft up to the present time, and we are preparing to sink again. We have sunk 24 fathoms since this company has been on, which is three and a half years.

21,148. What is the greatest depth?—124 fathoms from the surface.

21,149. At what shaft?—Gwen shaft.

21,150. How many men have you working there now?—There are nine men engaged in the shaft; they are now stripping down the lode in the last sinking, and as soon as that is done we shall put them to sink again.

21,151. Do the men work eight hours shifts?—Yes; that is our general arrangement. Where we want to press them very fast we work six hours only.

21,152. And they work night shifts?—Yes.

21,153. Where are your other principal workings?—Extending the bottom levels east and west from Gwen, and sinking the winzes from the 112 to the 124 fathoms levels, and such like general operations; that is tut work. Then we have stopes working at per fathom.

21,154. Do you use any artificial means of ventilation?—Occasionally, but not at present. We use a fan machine, if in sinking a winze or sump the air is not as it should be; but I do not know that there is one at present in operation in the mine.

21,155. Is it a wet mine at all?—No, it is comparatively dry; it is the dryest mine I have ever seen for the depth.

21,156. Do the men change when they come to the surface, or do they go home?—They go home to their houses.

21,157. Have they any means of changing here if they wished it?—There never has been such a provision in this mine, and we should have entirely to change the system to introduce it. Welshmen, living as they do within a very short distance and the mine being dry, always prefer changing in their cottages.

21,158. Do the miners generally reside near the mine?—I suppose the greater number are within a mile; I should think that two-thirds of the miners are within a mile. I do not know any extreme distances which would go beyond two miles.

21,159. What quantity of candles are the men allowed per week?—Two pounds per man we reckon to be about the thing.

21,160. What do they pay for them?—8*d.* a lb. is the nominal price.

21,161. And the same for powder?—Yes.

21,162. Have the men any club?—Yes; I believe there is a general system of friendly societies among them.

21,163. But is there any club belonging to the mine?—Yes.

21,164. What do the men pay to it?—6*d.* a month for doctor and club; we are obliged to be very economical; but that is all that we take out of their wages. The account of the club is scarcely thriving at present. We are obliged to borrow a little from the mine company; but we hope to make it make it pay at 6*d.* a month.

21,165. You keep a separate account?—Yes, and then when any accident occurs to injure a man, he has 5*s.* a week from that club.

21,166. Is the doctor appointed by the owners of the mine?—Yes, with the general consent of the men.

21,167. So that if the men objected to the doctor the owners would take it into consideration?—Of course they would. It is our object always to conciliate and to do the best for the men in that respect and to meet their wishes as far as practicable.

21,168. What are the earnings of the men?—I was looking over the books this morning. I am sorry that Mr. Williams, the purser, is not present; he has not shown the average for the last two months; but for the four months previous the earnings have been from 12*s.* to 15*s.* a week. I should think about 13*s.* 6*d.* or 14*s.* would be the average.

21,169. Do you keep a month in hand?—A fortnight; the pay is always a fortnight after the taking expires.

21,170. Do you pay in notes or in gold and silver?—Always in gold and silver.

21,171. So that the men can divide it amongst them?—Yes; they have the opportunity, and many of them do divide on the mine.

21,172. Are any women employed in the mine?—Yes, in dressing.

21,173. What are their wages?—Their wages, according to age, range from 5*d.* to 10*d.* a day.

21,174. Are they generally married or single women?—I do not know that there is a married woman on the mine.

21,175. Is there any place where they have their meals?—Yes; on each department floor there is a cottage: a sampling house is one place; they go in when they require shelter if they please.

21,176. There is no one to attend to the cooking of their meals?—No; there is no matron.

21,177. (*Mr. Kendall.*) How young do you employ the women?—There are scarcely any females under 18 years of age, and they are from that up to 20 and 25.

21,178. Do you find them very difficult to manage?—No; they are very tractable. There was the large number of 150 when we came here.

21,179. (*Mr. Holland.*) Do you consider yours a well-ventilated mine?—Yes, exceedingly well ventilated.

21,180. Have you any place where the candles will

not burn freely ?—No, I do not know any ; there was one end rather close but the candles would burn upright there.

21,181. How long does the powder smoke hang there ?—It may be for an hour or two after a blast.

21,182. Is it very unusual for it to hang as long as that ?—No ; that is about what it generally is. It does not clear off unless it is well ventilated by a winze, it will then clear off in a few minutes.

21,183. Is it general in many parts of the mine for powder smoke to hang as long as an hour ?—No, that was a long distance from a winze.

21,184. It was an exceptional case ?—Yes.

21,185. Is any part of the mine very dusty ?—No, I do not think that there is anything of that sort to complain of.

21,186. Do you think that the men suffer from dust at all ?—I do not know that they do ; nothing to any great extent ; the ground is moist enough to prevent making dust though it is comparatively dry as regards engine power pumping.

21,187. (*Mr. Kendall.*) At the 112 fathoms level going from Gwen shaft towards Dyer's shaft, going east, you must have had about 35 fathoms before you made any communication ?—Yes ; we had.

21,188. Did you use any artificial means of ventilation there ?—No artificial means whatever, but we had a very large level ; we have very fine levels.

21,189. What is the size of your levels ?—Nominally 7 feet by 5 feet ; but I believe they are more than that generally.

21,190. Have you any brattice of any kind ?—No.

21,191. You have nothing but the simple level ?—Just so.

21,192. And you only find inconvenience in blasting ?—Yes ; that level is communicated now.

21,193. How many men have you working in that end ?—Six.

21,194. Do they relieve every eight hours ?—Yes.

21,195. Do they relieve in place ?—Nominally.

21,196. Do the candles always burn well there ?—Yes.

21,197. The men never complain ?—I never heard them do so. The only difficulty in ventilation in this mine is during a few days in the most sultry weather in the summer ; there is a peculiarity about that, and it has occurred since Lord Kinnaird was here and underground, in the few hot days of last week ; and to remedy that we threw water down from the 65 fathoms level through one of the shafts (we have full engine power now), we made a first rate water fall and cleared all the levels.

21,198. How soon were the levels cleared ?—Almost instantly ; it agitated the whole air of the mine.

21,199. (*Mr. Holland.*) Did it make a perceptible draught up the up-cast shaft ?—I was not present when it was done in the evening ; they cleared it all out, so that the men had no complaint afterwards whatever.

21,200. (*Mr. Kendall.*) There was almost an instantaneous change ?—Quite so.

21,201. Have you had many drifts of 35 fathoms in that way ?—No, that was about the longest reach in the lower part of the mine that we have had ; it was poor ground.

21,202. I see that from a cross-cut at a 45-fathoms level you drove part of the way on the lode going west, and then came into a sort of cross-cut again ; you lost your lode, and then it appears as if you had a bit of lode again and then you made an angle, having driven 60 fathoms ; you made a turn almost at right angles and went 20 fathoms more, you then made another angle and went 60 fathoms more, that is 140 fathoms from any air communication ?—Yes.

21,203. Had you any fan there ?—No artificial means of ventilation whatever, and the candles will burn in the present end as well as they will in this room.

21,204. Through what did you go ?—Through slate rock entirely.

21,205. Had you any cracks in the slate ?—Nothing to name, only structural seams or cleavage lines.

21,206. How long would it take to clear the smoke there after blasting ?—An hour or two ; we have only worked it latterly with four men, and they have managed blast there just before leaving the place. That is a most remarkable instance. In driving, you should not only have very large levels, but should drive at a perfectly dead level ; the ventilation depends upon its being perfectly level ; if you lose one eighth of an inch in a fathom, your current of air ceases to circulate as you go on, but if you keep perfectly level you may drive for almost any distance, for the current of cold air then goes in at the bottom and the foul air comes out at the back or roof. That is a secret not generally known.

21,207. How large is your level ?—Full eight feet high, and six feet wide.

21,208. Are you always careful to take your stuff out soon ?—Yes, we always remove it a considerable distance backward ; at least as far back as the cross-cut, where there is any danger of obstructing the circulation of air. Taking any impediment out of the way, and driving a dead level, you may drive almost any distance.

21,209. Does not it very much depend upon the strata through which you drive ?—I do not lay much stress on that. An old Welsh agent, who first gave me the idea, drove a level 500 fathoms at Llandudno without any artificial ventilation or any communication whatever, by having a large level and driving it perfectly dead. His nominal loss of level was one inch in eight fathoms, but he did not lose so much as that. I have gone through that level scores of times, since it is communicated with the mine.

21,210. When you were driving the 112 from Dyer's to Gwen shaft, did you drive it in the same way ?—Yes, we were obliged to drive it at a dead level to meet another level.

21,211. Did you meet well ?—Yes, quite well.

21,212. There is no extra expense in driving dead ?—None whatever. My opinion is, that we are not yet up to the proper size for driving, not only expeditiously, but economically, because when we have to blast the ground it requires a certain range or liberty for it.

21,213. For the long crosscut what is your price per fathom ?—From 5*l.* to 6*l.*

21,214. It is very easy ground ?—Very moderate ground.

21,215. There is no timber used ?—Not a bit.

21,216. This mine is in the hands of Messrs. Taylor and Company ?—Yes, as managers.

21,217. They have lately had a grant from the proprietors ?—Yes, the Marquis of Anglesey and Lady Dinorben.

21,218. Did you commence as an agent with the new grant ?—No, my predecessor was, Mr. Henry Thomas, who is now at the Aberystwith mines.

21,219. How long was he here ?—15 months ; but I am acquainted with the history of the mine, for I was inspecting agent to the Lords for three years before our company took it in hand.

21,220. There were certain reasons why the late adventurers did not take a new grant ?—Yes.

21,221. What was the state of ventilation when you came ?—Much the same as at present ; being a rich mine, from the frequent working communications, it was tolerable.

21,222. Are not your veins very uncertain, sometimes very small and sometimes very large ?—Yes.

21,223. When they are very small, if there is room enough for a man to pass through, do you save the expense of making a larger level ?—We make a good level even then.

21,224. Did they in olden time ?—Yes, tolerably good, but not to be compared with ours ; we have greatly improved it.

21,225. Even in olden time they were not content to let the men drag through those places ?—No.

ANGLESEA.

Capt. W. Vivian.

21 July 1863.

21,226. But at present you as a matter of economy carry your levels high and wide?—Yes.

21,227. And you find that by driving at a level you can go on at a very great distance without ventilation?—Yes.

21,228. We have heard a good deal in the last week about smelling bad air, have you worked your way up as a miner?—Yes, I have been 35 years practically engaged in mines, two thirds of which as a working miner.

21,229. What is your opinion on this point; can you or can you not from experience, if air is bad, even before before the candle shows it smell bad air?—In some instances I can do so, certainly.

21,230. Before the candle shows a dullness?—It depends upon how the foul air arises. If it is from gas generated from decaying wood, it will naturally give a smell, but if it exudes from the rock itself I doubt whether I could smell it.

21,231. (*Mr. Holland.*) Suppose there is insufficient air?—That, of course, would be much the same as an ill-ventilated room, where we can perceive it in a moment.

21,232. By your own sensation do you feel a deficiency of ventilation before the candle shows it?—When it gets very foul and the candle shows it of course it is very trying to the system, and one can perceive it then, but I do not think that I could always detect it before the candle shows it.

21,233. (*Mr. Leveson Gower.*) Do you find any difference in respect of that between Cornwall and here?—None whatever. I think that that is a general case in all mines.

21,234. Do you consider the health of the miners good here?—Very good.

21,235. How is it in comparison with what it is in Cornwall?—Very good in comparison.

21,236. Is the health better here than there?—Very much better. We are not troubled with the miners' disease as they are in Cornwall. One old miner worked in our mine till he was 72 years of age, until a month or two ago, from the infirmities of age, he was obliged to give up, but still his breath was as good as that of any average man of that age. The old men who were formerly miners are working on our pits, and they are employed on the roads and in various ways, and some are old pensioners.

21,237. Are the men here generally sober?—Yes, they are generally temperate in their habits, as far as my observation goes, with a few exceptions; we are sometimes obliged to exercise discipline, but they are better in this respect than some others, who are considered above them in the scale of social life.

21,238. (*Mr. St. Aubyn.*) Do your men all come up by ladders?—All by ladders and steps.

21,239. Have you it in contemplation to put up a man engine?—No, our mine is not deep enough to warrant the outlay or call for it.

21,240. At what depth should you consider it necessary to put up a man engine?—Perhaps if the mine goes 50 fathoms deeper we might then think of it.

21,241. Say 150 fathoms?—Yes. The men now get up from their bottom places in 20 minutes easily.

21,242. You have stated that as a general rule if you work a level perfectly dead it will ensure good ventilation to the furthest end, within a reasonable distance?—Yes. The level which I spoke of which was driven 500 fathoms is now communicated. It was communicated before I saw it, but they were able to drive it without any artificial ventilation, or any communication.

21,243. Up to what distance should you say that that can be done as a general rule?—I should not hesitate to undertake a cross-cut 250 fathoms. It might depend partly upon the nature of the strata.

21,244. That distance would be modified by the nature of the strata in which you were working?—Most certainly.

21,245. What strata are most favourable for carrying a level through a long distance, and what are not so favourable, comparing for instance slate and granite and killas?—My experience in that respect is confined to the instance in the lime stone of Llandudno, which I spoke of, and the slate rock of this mine. I have never seen that experiment tried in the granite in Cornwall.

21,246. But still that rule of yours of carrying a level perfectly dead would apply to a certain extent to driving through granite, and killas, and so on?—Quite so, in my opinion.

21,247. From your experience, is it generally the practice to carry the levels as dead in Cornwall as here?—I think not. My experience there was derived from 30, 20, and up to 15 years ago, when I left Cornwall; but I had not seen in Cornwall a level so perfectly dead and so wide for the object of securing good ventilation as I have seen since when I adopted it. On this point I may be allowed to mention that I published a letter a short time ago in the Mining and Smelting Magazine, a new periodical in mining, and in answer to that letter Captain Charles Thomas, of Dolcoath, gave a letter stating that if I were to come to Cornwall now, I should find the levels very much improved since I left it 15 years ago.

21,248. (*Mr. Kendall.*) But still coinciding with you?—Yes, he quite agreed with my general views.

21,249. (*Chairman.*) Driving perfectly level, for the object of ventilation, the least accumulation of deads would obstruct it?—Most certainly.

21,250. (*Mr. Holland.*) Have you any levels in your mine which are 8 feet high and 6 feet wide, which are not quite at a dead level?—No, I do not know that we have. Our ordinary levels are 7 feet by 5, although they may be a little more or less, but they are generally more. I require that they shall be a bold good level. I tested the accuracy of this principle at Llandudno mine.

21,251. Is a slight variation in the level very important?—From my experience as a miner, I have proved that if you rise up in the back the air will not circulate up above in a level as it will below, because the fresh air is more dense, and will naturally descend to the bottom; it will not ascend against foul air, and the circulation will not take place as will be the case by the fresh air descending, being more dense. I know from experience that by driving a level perfectly dead you get the chance of the cold pure air coming in at the bottom, and the lighter impure air going out at the top. If the level has no impediment the smoke and foul air will always go out at the roof, and the dense air will come in at the bottom.

21,252. (*Mr. St. Aubyn.*) You have stated that the accumulation of deads would have the same effect as having a bad level?—Quite so.

21,253. How long do you allow the deads to remain here, before clearing them out?—The men wheel them back to a certain point immediately.

21,254. (*Chairman.*) How do you enforce the removal of the deads?—We have a rule and we explain the matter to the men and show the necessity of it for their own sakes, and sometimes we are obliged to use rather harder words, but I do not think that we ever go to the extreme of fining them for the nonobservance of it.

21,255. Have you any accidents from blasting?—In the Parry's mines we have but few accidents arising from premature explosions, notwithstanding the rock constituting the lode, is very hard and fiery, and I attribute this to the precaution of using cartridges enclosing the charge of powder.

21,256. (*Mr. Kendall.*) You say that the miners are healthier here than in Cornwall?—Yes.

21,257. Why are they so?—First, because the mine is not so deep; they have not the same stress in climbing; in the next place the ventilation is better than the ventilation of the mines generally in Cornwall, and the mine is comparatively dry.

21,258. And it is not the custom to work such long hours?—No, and they don't work so hard; they do not strain the system as they do in Cornwall.

21,259. Taking the lodging of the miners here and the lodging of the miners in Cornwall, which is the best?—I think that the Cornish is the best.

21,260. By far the best?—By far the best. The cottages are bad here, and I have always told them so, they build them so low, and they are so ill-ventilated.

The witness withdrew.

Dr. THOMAS HUGHES, of Amlwch, examined.

21,261. (*Chairman.*) Are you the medical man appointed to attend this mine?—Yes.

21,262. And the Mona mine?—No only this mine.

21,263. How is the remuneration fixed?—I receive so much annually.

21,264. You look to the Company for payment?—Yes.

21,265. For that have you to attend the men and their families or only the men?—Only the underground men; it is only applicable to accidents.

21,266. There is nothing for sickness?—No.

21,267. Do you attend any miners for sickness?—Yes, most of them.

21,268. But they themselves pay for that?—Yes; they generally in fact become paupers; they have large families, and I am the Union medical officer, and they fall under my care in that way.

21,269. When they come to you do you find any men suffering from miners' asthma?—Not very frequently. There are cases of asthma, but I cannot say that they are very much more frequent than in other classes of people.

21,270. Then there is no disease peculiar to miners?—Bronchitis and consumption I have noticed to be the most frequent diseases amongst the miners.

21,271. Is there is any particular age at which you find them liable to that?—No, not particularly. They are generally advanced in years, about 35 to 40 before it shows itself.

21,272. Have you any cases of that now under treatment?—Some.

21,273. Do the miners from the other mine as well as this mine come to you?—As medical officer of the Union many of them do, because they are poor and have large families, and they have no resource but the parish.

21,274. Do they apply to the parish for relief?—Yes, after a time. There is no club provided in the other mine I believe, except for accidents.

21,275. Is there no club in this mine?—Only for accidents.

21,276. (*Mr. Holland.*) Have you practised among other persons besides miners?—Yes.

21,277. Is there decidedly more bronchitis among miners than among others?—I believe there is as well as a good deal of consumption.

21,278. Do a large proportion of the men above 40 suffer from bronchitis or some such disease?—Yes, a good many of the miners.

21,279. Do you think that more than half of the men above 40 suffer from it?—No, not so many as that I think.

21,280. Is it common for men to have this complaint who do not apply for medical assistance?—Yes.

21,281. They give it up as a bad job?—Yes, very often they go for medicines themselves; they go to druggists, they do not apply to a medical man.

21,282. And they do nothing?—And they do nothing. They very often apply to druggists and old women and quacks for herbs.

21,283. The conclusion from that is that a larger proportion may suffer than those you know, and that you do not see it?—Yes.

21,284. Do you think that the miners suffer more from rheumatism than the farm labourers do?—I believe not in this mine.

21,285. Are they more liable to dyspepsia than farm labourers?—A good many suffer from dyspepsia.

21,286. Is it a common thing among them?—Yes, rather common. It is due probably to eating slops and fluid food for dinner.

21,287. Do they eat differently from farm labourers?—I believe they do.

21,288. Have you noticed that they are more fond of tasty things?—I have not.

21,289. What is their general and ordinary food?—They take too much tea and coffee to the exclusion of animal food.

21,290. Is that from poverty or from taste?—Poverty, I think. The farm labourers are fed by the farmers in this country.

21,291. Do you think that they live better than the miners?—As a rule, I think so.

21,292. Can you distinguish a farm labourer from a miner?—I think so; old age, I think, comes on earlier in a miner.

21,293. How many years difference should you say there is?—10 or 15 I should say.

21,294. As much as that?—I think so decidedly; in underground men at least.

21,295. Do you think that a miner of 50 looks as old a labourer of 65?—I think so, as a rule. I mean labourers working for farmers, because they are generally very healthy, being always in the open air. That air of course is pure.

21,296. Do the miners crowd more together than the agricultural labourers; are there more in a house or is it much the same?—Much the same, I think.

21,297. There is no material difference?—I think not.

21,298. Are the houses much alike?—Very much alike.

21,299. We have been told that they are very small and confined?—They are very small all round the country here.

21,300. Like the ordinary Welsh houses?—Yes

21,301. Are they generally single rooms?—Yes.

21,302. Do they take lodgers?—Hardly ever.

21,303. Where do the unmarried miners lodge?—Generally with their parents.

21,304. Not with strangers?—Very seldom.

21,305. Are they generally natives of the district?—Almost all.

21,306. You do not think that the miners, as a class, are more crowded together in their bedrooms than the agricultural labourers?—I do not think so.

21,307. There is nothing marked in that?—Not to any marked extent.

21,308. (*Mr. Leveson Gower.*) Is there any consumption among the agricultural labourers?—Yes, very much; it prevails very much in this part.

21,309. Do you see any difference between the consumption which the miners have and the consumption of the agricultural labourers, or does it appear to you to be the same disease?—It is very much the same. There appears to be a little more difficulty of breathing, I think, in the miners.

21,310. To what cause do you attribute the ill health of the miners?—Impure air, from working underground.

21,311. Any other cause?—I cannot speak to any other cause. They generally get wet from working underground in wet places, and take cold and neglect it.

21,312. Do they change on coming up?—They generally change after going home in this mine.

21,313. Do you attribute their colds to their doing that?—To the impure air, and also to the particles of dust in the air. That often irritates the bronchial tubes.

21,314. Do you attribute anything to their going home in their wet clothes?—I think that that has to do with it as well.

21,315. How long have you practised among the men in this mine?—I may say six years.

21,316. Have you seen any change in the state of

ANGLESEA.

Dr. T. Hughes.

21 July 1863.

their health now from what it was when you came?—I do not see any at all. I was looking yesterday over what I have attended them for, and I do not see much difference during the last five years.

21,317. (*Mr. St. Aubyn.*) Are you the sole Union medical officer?—I am in this part.

21,318. (*Chairman.*) What is the parish?—The Amlwch district of the Anglesea Union.

21,319. (*Mr. St. Aubyn.*) How long have you practised in Almwch?—For six years.

21,320. You have already said that consumption is frequent among the miners?—Very frequent.

21,321. Is asthma also frequent?—Not particularly so, as far as I have discovered; bronchitis and consumption are the most frequent.

21,322. Are rheumatic affections frequent?—Not very frequent—not more than among other people.

21,323. You would not say that asthma and rheumatic affections were almost unknown among miners?—By no means.

The witness withdrew.

Mr. RICHARD LEWIS PARRY, of Almwch, examined.

Mr. R. L. Parry.

21,324. (*Chairman.*) You reside at Almwch?—Yes.

21,325. Are you surgeon to any of the mines in this district?—Yes, the Mona mine. Every man in the Parys mine used to choose his own surgeon till recently.

21,326. Now the surgeon is appointed by the mine?—Yes.

21,327. And at the Mona mine the men choose their own doctor?—Yes.

21,328. How long has the system been changed at the Parys mine?—About nine months.

21,329. And the doctor is now appointed by the company?—Yes, and not by the men, but it is the men's money.

21,330. The men pay?—The men pay and the company keeps the money.

21,331. Are you the doctor to the Union?—No, I had been for 10 years, but I gave it up.

21,332. How long have you given it up?—About three years.

21,333. How long have you practised in Amlwch?—About 15 years.

21,334. Had you much opportunity while you were the doctor of the Union of seeing many cases of miners?—Yes, almost all of them.

21,335. But now your experience is more confined to the one mine?—No; it extends to both as far as their families are concerned; anything but accidents.

21,336. For illness the miners come to you?—Principally; almost all of them.

21,337. Is there any affection which miners peculiarly suffer from more than others?—Yes, principally consumption and bronchitis and rheumatism.

21,338. They do suffer from rheumatism?—Yes; a great number from sciatica, especially when they get a little advanced in years, 60 years of age or something of that sort.

21,339. At what time do the miners generally become affected in their breathing?—Very early. You can hardly name 50 or 60 men under 30 who are not affected by it; if they keep clear of it till they are about 40 or 50, they get on pretty well after that, but the mortality is amongst the youg men principally, say under 30 or 40.

21,340. Have you any case at present under treatment?—Yes, a great number.

21,341. For this affection particularly?—Yes.

21,342. Do you see any difference between the two mines?—I think there is a great improvement in the Parys mine. There is a great deal of difficulty in the other mine, as far as ventilation goes.

21,343. But there has been an improvement of late years in the Parys mine?—Yes, but it is very lately.

21,344. Do you think that the state of the cottages is good or bad?—Very bad indeed.

21,345. Does that tend to produce this kind of disease in your opinion?—Yes, it does; you will find cottages with a single room, with about seven or eight or ten in family in it; they have a peculiar kind of bed here; it is more like a closet than a bed, and it separates the house into two compartments.

21,346. Do you find when they come to you in the early stage of this disease that you are able to cure them?—No, they very seldom come until they are almost in the last stage.

21,347. They do not apply to you when they are first affected?—No, they merely fancy that it is a common cold, and they hang on at their work, and they go underground and it aggravates it, especially where the mine is not properly ventilated.

21,348. (*Mr. Holland.*) I understand you to say that the miners are very much more liable to this disease than the general population?—Yes.

21,349. Are they much worse lodged than the general population?—Yes, decidedly.

21,350. In what respect?—As far as ventilation is concerned, and as far as regards the construction of their cottages.

21,351. Are they worse constructed cottages than the farm labourers have?—Yes, I think they are, generally speaking.

21,352. Are they more crowded?—Much more crowded.

21,353. How does that happen?—I do do not know how it is, but they are large in family.

21,354. Does it happen from the miners going as lodgers into other families?—No.

21,355. That is not the custom?—That is not the custom. The cottage is just one room, and then they divide it into two by their bed.

21,356. What is a common number of inmates in a room?—In a room, perhaps not half the size of this, you will find 10 or 15 persons living, and in others four or five or six, more or less.

21,357. Do you mean that several families live in one room?—No; it is daughters and sons and all.

21,358. Is it common for 15 to be in one room?—Not common; you will find them from 12 to 15, but the general average is about 7; the highest nnmber is from 10 to 15; they are composed of daughters and sons, and you will find two or three beds in that house.

21,359. Is not that a rare case?—No.

21,360. Are the miners decidedly older looking at the same age than the agricultural labourers?—Yes, decidedly.

21,361. What difference in appearance is there?—You may say that a man of about 50 years of age looks about 65.

21,362. Do you mean that he is like a man of 65 in constitution?—Some of them are. There is a very curious case with them, that if they pull through it pretty well till they are 50 or 55 they live to a good age, but the majority of them die before they are 50.

21,363. Do the miners complain much of bad ventilation in the mines?—Yes, very much.

21,364. Is that a very general complaint?—Yes.

21,365. (*Sir P. Grey Egerton.*) In which mine?—Both mines, but they say that the Parys mine is improved lately.

21,366. (*Mr. Holland.*) Judging from your own knowledge, is that a correct opinion?—Yes; I have been down both of them.

21,367. Is it your opinion that they are badly ventilated?—Yes.

21,368. From what do you draw that conclusion?—From the difficulty of breathing which I experienced myself when I was down.

21,369. You observed a distinct closeness of air?—Yes.

21,370. Did you notice that the candles burned badly in any part of the mine?—Yes, in some drifts.

21,371. (*Mr. St. Aubyn.*) Which mine are you now speaking of?—Both of them.

21,372. (*Mr. Holland.*) Have you been down both of them frequently?—Not very often.

21,373. Have you noticed a very perceptible closeness of air when the candle did not burn badly?—Yes, decidedly; so much so that in the Mona mine I had to go upon my knees to get through, and when I did get through, I found two men working there, and the candles were very dim.

21,374. Are you satisfied that that disagreeable feeling was the result of closeness of air, and not of unusual fatigue on your own part?—There was no ventilation whatever there excepting through the hole that I crawled through; there is no question about that.

21,375. Are the mines in any part disagreeably dusty?—No; there is too much damp in them to be dusty.

21,376. Do the men complain of annoyance or injury from dust in the working?—No.

21,377. Do they complain of powder smoke?—Yes.

21,378. Do you think that complaint just?—Yes, very just.

21,379. Have you been able to trace any ill effect from the breathing of powder smoke?—No, not particularly more than from foul air. I take the place altogether.

21,380. Have they complained of excessive fatigue from climbing?—No, I have not heard them complain much about that.

21,381. Do you think that there is any ground of complaint of that sort here?—I think that taking the construction altogether, it is anything but what it ought to be.

21,382. In what respect?—In timber for supporting the shafts and in coming upon the surface they get into rather a rotten state, and they do not look after them properly.

21,383. Do you consider them dangerous?—Accidents occur.

21,384. Have you had accidents?—Yes.

21,385. From falling from the ladders?—From falling.

21,386. Have you had many such accidents?—I do not know that I can say a great number, but still I have had some few.

21,387. Hurts or fatal accidents?—Not fatal.

21,388. Breaking limbs?—Yes.

21,389. Have you attributed them to the faulty state of the ladders?—Yes, in a great measure.

21,390. Have you had many accidents from gunpowder blasting?—Yes, a good many.

21,391. With what results generally?—Not fatal, but I have one case now under my care, where the accident occurred six months ago.

21,392. Is that a case of injury to the eyes?—All over the body.

21,393. Have you had any injury to the eyes from blasting?—Yes.

21,394. Have you had many cases of that sort?—Yes, a good many; some few of the men are alive now, blind of course.

21,395. Is it so much as to be remarked as common; is injury to the eyes a common accident here?—Not very common.

21,396. Have you many blind people under your care?—Not under my care now, but they have been under my care.

21,397. To what cause do you attribute the lung disease; except the bad air of the mines and the bad condition of the men's sleeping room, is there any other cause?—I cannot attribute it to anything else, unless it is hereditary about the neighbourhood.

21,398. Do they feed badly?—Very badly.

21,399. In what respect?—In not having sufficient.

21,400. Is that from their poverty?—From their poverty and bad pay.

21,401. We are told that they get about 13*s.* or 14*s.* a week?—Some of them. Sometimes a family of 10 or 12 get 14*s.*, or if they get 10*s.* or 14*s.* they are pretty well off, but sometimes they will not make 5*s.*, and then they run into debt, and if they exceed that then it is deducted out of their pay again. They may run into debt for months and months.

21,402. That is a better income than farm labourers usually get, is it not?—No.

21,403. Do farm labourers here get more than 14*s.* a week?—They get upon the average 8*s.* or 10*s.*, and then they are allowed the privilege of a cow, that is if they are married.

21,404. Do the farm labourers live better than miners?—A great deal better.

21,405. (*Mr. Kendall.*) Have you been underground in the Parys mine since it has been under the management of Messrs. Taylor?—No.

21,406. How frequently were you underground before it came under the management of Messrs. Taylor?—About three times.

21,407. In the Parys mine?—Yes.

21,408. Have you lately been underground in the Mona mine?—Yes.

21,409. Within the last two years?—Yes.

21,410. How many times have you been underground there?—Twice there.

21,411. Have you been underground frequently in other mines?—No, these are the only mines I have ever descended.

21,412. So that you have been down five times in your lifetime?—Yes.

21,413. Do you know any accident which has occurred entirely from the decayed timber-work, from a neglect to supply any defects on the part of the timber men here?—I do not know it of my own knowledge, but I have heard it from those who have been complaining, and I have attended accidents from that cause.

21,414. Where they have said that the timber has been giving way, and that the fall has been in consequence of the rotteness of the timber?—Yes.

21,415. Was that in the Parys mine or the other mine?—In the other mine.

21,416. How long ago?—I think it is only six or eight months ago, but they were told not to use that, they were warned not to do so.

21,417. Not to go up that way?—Not to go up that way.

21,418. I suppose it was a shorter way?—I suppose it was more convenient for the men.

21,419. But they were warned not to go that way?—Yes.

21,420. And they did?—They did so.

21,421. (*Mr. Leveson Gower.*) Are you acquainted with the nature of the miners' disease of the Cornish miners?—No, only from what I have heard.

21,422. But you have read about it, I suppose?—Yes.

21,423. Is there any distinction between the disease which these men suffer from and the Cornish miners' disease?—Yes, I think there is a good deal of difference between the two.

21,424. What is the difference?—The difference is that I do not think there is so much consumption amongst the men in Cornwall, according to what I have read.

21,425. Then you do not call miners' disease there consumption?—No; a good deal of it is hereditary here. Scrofula is very prevalent.

21,426. Do you attribute the illness of the men mostly to their mining or to the state of their cottages?—They are predisposed to it, and then when they get into the foul air and the close breathing, it certainly hastens the disease; it brings it to a crisis sooner than it would if they were labouring men about the fields.

21,427. You mean that they are predisposed to it from the bad state of their cottages?—Yes.

21,428. (*Mr. Holland.*) Can you explain why the miners' houses become much more crowded than the houses of the agricultural labourers?—Yes, the reason is that the miner's family work in the mines, and they stick to it till they get married in one way

ANGLESEA.

Mr. R. L. Parry.

21 July 1863.

or another. The agricultural labourer's family, when they get about 8 or 10 or 12 years of age, are distributed to different farms, and they do not live at home.

21,429. Do the miners marry earlier that the agricultural labourers?—No, not so young.

21,430. As a habit the young members of a miner's family remain till they are 20 or 22 years of age?—Yes, until they get married; they are seldom married before that.

21,431. Whereas the children of the farm labourers go away at about 12 or 14?—Yes, as soon as they are able to handle a spade, or to feed cows, or churn, or anything of that kind, they are off directly; a farm labourer can get off his family in a moment, but a miner cannot do that.

The witness withdrew.

MONA MINE.

CAPTAIN GEORGE TREWREN, of Mona Mine, examined.

Capt. G. Trewren.

21,432. (*Chairman.*) Of what mine have you charge?—The Mona mine.

21,433. What is the produce of it?—Copper.

21,434. How many men have you working underground?—Men and boys, somewhere about 125.

21,435. What is the deepest level which you are now working?—60 fathoms under the adit.

21,436. How far are you driving any level from any shaft or winze?—From 20 to 30 fathoms: about 25 fathoms.

21,437. Do you use any artificial means of ventilation?—Yes, we have some air pipes and a machine.

21,438. How is the machine worked?—By manual labour.

21,439. Have you any air pipes without a machine? Yes, at the new shaft.

21,440. Do you find that answer?—Yes, very well indeed for the number of men that we have.

21,441. How long is the powder smoke getting out?—It does not stand perhaps a quarter of an hour.

21,442. How many shifts of men have you working there?—Three; at Carns they are only working two.

21,443. How many hours each?—Eight hours each.

The witness withdrew.

Mr. THOMAS EVANS, of Mona Mine, examined.

Mr. T. Evans.

21,444. (*Chairman.*) What allowance for candles per week have the men?—2lbs. per week.

21,445. What is the price which they are charged for them?—1*s.* 2*d.* per lb.

21,446. And how much for the powder?—1*s.* 6*d.* With regard to the powder and candles, the men get a certain price per ton for the ore, and they pay for the candles and powder nominally.

21,447. How often are the men paid?—Monthly.

21,448. Do you keep a month in hand?—No, we only keep a certain portion in hand. We give them subsist as far as we can at the end of the month, and then give them the balance at the end of the following month.

21,449. But there is a month in hand?—No; we give them a subsist.

21,450. But they are not settled up with for a month?—No, we are not able to do it.

21,451. Is there a doctor attached to the mine?—We have no appointed doctor.

21,452. What means have the men of medical attendance?—They choose their doctor, and the mine pays.

21,453. What do the men pay towards the doctor?—One penny per week per man.

21,454. Is that for attendance for sickness, or for hurt?—Not for sickness; we do not pay for sickness.

21,455. Only for visible hurt?—For visible hurt, or internal hurt; any hurt.

21,456. Is the sum which the men pay towards the doctor sufficient to meet the doctor's salary?—We do not pay a regular doctor's salary. The men have their choice of doctors, and we pay them their bill; there is no arrangement.

21,457. Who is the doctor?—Any doctor the men may choose. Sometimes it is Mr. Parry, who was examined by you to-day.

21,458. What other deductions are there from the pay of the men?—Nothing else, unless they have got into debt previously. If they get into debt, then we never deduct it until they have had 50*s.* per month of four weeks, and 3*l.* per month of five weeks.

21,459. What are they supposed to earn?—50*s.* per month of four weeks and 60*s.* for a five weeks' month.

21,460. What do the boys get?—From 20*s.* to 25*s.* and 30*s.* a month, according to their size and the arrangement made between them and the men; that is a thing which we know little of.

21,461. Have you any stipulation as to the age at which boys may go down?—We never take young boys below 10, 11, or 12; it depends more upon their size than their age.

21,462. What do the women earn upon the surface?—The women get from 5*d.* to 10*d.* a day. With regard to the allowances of the men there is one thing which I do not think is done anywhere but here; we pay the old miners a pension; we have a list of pensioners.

21,463. You have a provision for the men who are disabled?—We give them 5*s.* a week.

21,464. For how long?—Until they recover.

21,465. If they remain permanently disabled, how are they provided for?—If they remain permanently disabled by an accident here, they get that amount while they live.

21,466. You have them as pensioners?—Yes; we have several classes of them. One who is permanently disabled gets 1*l.* a month and the others 16*s.*; the old infirm miners, those who are disabled through old age, get 16*s.*

21,467. How many years work at a mine would entitle a man to become a pensioner?—I have never heard one refused. One who has any claim whatever is generally listened to, and a pension is given him; but most of the men who are here work all their lives. They generally work until they are 70 years of age, and sometimes longer than that. If they have a fatal accident, we provide a coffin and pay the expenses of the funeral.

21,468. (*Sir P. Grey Egerton.*) Do the pensions come out of the club money which the men subscribe?—They are paid by the general mine money.

21,469. (*Chairman.*) The men pay 1*d.* a week?—Yes. The club money is not nearly sufficient to pay it; it does not even pay the doctor's bill. There was an arrangement once made here by which the doctor got a stated sum per annum, but he was not found to be sufficiently attentive to the miners when that plan existed, and the system was altered.

21,470. Have you any accidents from blasting?—I have never heard of more than two or three; there has not been one since I have known anything of the mine.

The witness withdrew.

Adjourned to To-morrow.

Devil's Bridge, Cardiganshire.

Friday, 24th July 1863.

PRESENT:

The Right Honourable Lord KINNAIRD, K.T.
Sir P. GREY EGERTON, Bart., M.P.
NICHOLAS KENDALL, Esq., M.P.
P. H. HOLLAND, Esq.

The Right Honourable Lord KINNAIRD, K.T., in the Chair.

Captain RICHARD RIDGE, of Devil's Bridge, examined.

DEVIL'S BRIDGE, CARDIGANSHIRE.
Capt. R. Ridge.
24 July 1863.

21,471. (*Chairman*). Of what mines have you charge?—Rheidol is the mine in which I am chiefly engaged.

21,472. About how many men have you working underground there?—26.

21,473. What is the greatest depth at which you are working?—Our deepest level is about 160 fathoms.

21,474. Are you working there?—Yes, draining a level.

21,475. How far is that level from your shaft?—It is about 150 fathoms.

21,476. What are the other levels?—We have one level driven in the hill of a depth of about 160 fathoms, and another at about 140 fathoms; the lowest level is an adit level from the valley.

21,477. Do the men enter by the adit level?—Yes; that is driven in 300 fathoms.

21,478. Where the men are working now at the 150 fathoms, which is the nearest communication to any other level?—25 fathoms from it.

21,479. Do you require any artificial means of ventilation?—We have rises.

21,480. Have you any artificial means besides that?—No; some time back, before we put a rise, we had a waterfall, and I have the same now in driving the level up here; at 160 fathoms we have a waterfall.

21,481. You do not require it at the other level at present?—No.

21,482. What distance from a rise or a winze have you ever driven without a waterfall or other artificial ventilation?—About 40 fathoms.

21,483. When you come to that distance you think that it is necessary to put in air?—Yes.

21,484. And not before?—Yes, it would be better if you could put it in, but we generally run it on as far as we can, although it would be all the better to put it in at 20 fathoms.

21,485. Why do you not do so?—Because we try to save the expense to the Company, though in the end it is the worse for the Company, because I could get the ground driven much cheaper if the air was put in at once.

21,486. Are the company, do you suppose, aware of the fact which you have stated that it would be to their interest to put in air sooner?—Yes, they are a little aware of it; but they will say, "Yes; push on a little further; we will do as well as we can for a bit, and we can see if the ground turns out better, and we shall better afford it."

21,487. What is the name of the other mine with which you are connected?—East Haford mine.

21,488. How many men have you employed there?—I have six employed there in driving a level.

21,489. Is it a level from the day?—Yes.

21,490. How far have you gone in there?—160 fathoms.

21,491. What means of ventilation have you there?—There they were quite agreeable to my ventilating it in the commencement with a waterfall, because we calculated driving that level 300 fathoms. We have one of the best blasts of air that was ever given in Cardiganshire. We get zinc pipes of six inches in diameter, and you cannot keep a candle within ten fathoms.

21,492. How is the water applied?—Running water off the engine, a regular stream running and falling down about 50 feet through a pipe of about a foot diameter, and then it goes in through a tube, it runs out in the bottom. It is made like a clock case and there is a place where the water falls on a solid bottom of water; but above that a pipe goes out, and the air is obliged to go out through that pipe and cannot get through the solid water.

21,493. You find that the powder smoke does not hang there?—It is cleared out; the engineers belonging to the railway have been in to see it several times; I put in the same in Scotland; I have done a good deal of work in Scotland; I put three tunnels through the city of Edinburgh; I was employed under the sheriff of Edinburgh; I was Inspector for the safety of the public.

21,494–5. (*Mr. Holland.*) Did you ventilate those tunnels in the same way; Yes, in the very same way. I was employed under the head engineer, and he was employed under the Sheriff.

21,496. (*Mr. Kendall.*) You were what is called the clerk of the works?—I was Inspector.

21,497. (*Chairman.*) Are you acquainted with other mines in this district?—Yes, I have inspected the South Lisburne mine; it is not under the Messrs. Taylor.

21,498. (*Mr. Kendall.*) What did you go there for?—Inspecting for the Company; I have been there several times on the Company's behalf.

21,499. (*Chairman*). Are there many men working there?—About 30.

21,500. Is it well ventilated?—It is only middling.

21,501. Do they adopt any artificial means there? They are just like we are, pushing on; they ought to have air; it is a mine which will not pay its way, and they are trying to keep down the expense, and in the end it is the worse for all.

21,502. In your opinion, is that generally the case in the smaller mines in this district?—It is generally the case throughout the district; if you get a man to tell you the truth you will find it the case everywhere.

21,503. The poverty of a mine prevents the adventurers working it properly?—Yes.

21,504. Do the men suffer from working?—Yes; I have been underground this morning in some of our levels. When you go in about 20 or 30 fathoms, you will perceive a smell which will almost knock you back, a nasty, filthy, bad smell; that is what kills the miners.

21,505. How does it affect them?—It affects their lungs.

21,506. At what age do they die from it?—Generally about 25 or 30, or something like that. When a miner gets up about 40 years of age he is not worth the snap of a finger.

21,507. What are the earnings of the men?—On the average about 12*s.* 6*d.* and 15*s.* a week.

21,508. What allowance of candles have the men per week?—They are allowed 3 lbs. per man.

21,509. How many hours shift do they work?—Eight hours.

21,510. What are the men charged for the candles?—About 7*d.* a lb.

21,511. And what deduction is made for the doctor?—6*d.* per month.

21,512. Is that for illness or hurt?—Illness and hurt.

21,513. Do the men choose their own doctor, or is he appointed by the adventurers?—He is appointed by the majority of the men.

21,514. Does any difficulty arise in that mode of appointment?—No, scarcely ever.

DEVIL'S BRIDGE, CARDIGANSHIRE.

Capt. R. Ridge.

24 July 1863.

21,515. Have you any accidents from blasting?—No; I have been in this mine now about 12 years, and never had any accident happen, not so much as a broken finger, which is a thing I suppose hardly ever known in this neighbourhood.

21,516. Do the men reside near the mines?—Some of them have about four miles to walk, and three miles, and two miles.

21,517. Is the Rheidol mine wet at all?—It is quite dry.

21,518. Do the men change when they come to the surface, or change at home?—They change at home generally.

21,519. Is there any provision at the mine for their changing when they come to the surface?—No; they generally come in the clothes which they wear, and go back in the same; it is generally the case in our mine, because it is generally a dry mine.

21,520. Should you say that that is the case generally in the smaller mines with which you are acquainted?—Yes; it is the general case in this neighbourhood, but not through Shropshire.

21,521. (*Mr. Holland.*) You have told us that it costs a great deal more to drive at the end of the level than at the beginning of the level?—Yes.

21,522. What is the difference?—I should think about 1*l.* in a fathom if the level is a very long one.

21,523. Is the cost of the blowing machine which you have described considerable?—No; it is not a very considerable cost; it is a fall of water.

21,524. Would it not very soon pay itself, by saving 1*l.* a fathom in the driving?—Yes.

21,525. Are there many cases where you could not get water to work it?—Yes; there are many cases where you cannot get water enough, and there it must be done by a machine; we have machines to blow when we cannot get water sufficient.

21,526. Would it not always pay to use a machine to drive air in rather than pay 1*l.* extra a fathom for driving?—I daresay that it would be as well, generally speaking.

21,527. You have told us that the smell of a close level and the feeling of oppression is very great?—Yes.

21,528. In that case, does the candle show a bad burning as soon as you feel an oppression?—No, not in lead mines.

21,529. You feel bad air before the candle shows to burn badly?—Yes.

21,530. Is that a general rule?—Yes; wherever there is mineral you will get a taste of it sooner than where there is no mineral.

21,531. (*Mr. Kendall*). The richer the vein the greater the smell?—Yes.

21,532. Did you ever try it in copper mines?—No; I am not accustomed to copper mines; in lead mines I have.

21,533. Were you a miner before you were an agent?—Yes.

21,534. You worked your way up?—Yes; I was a miner when I was able to walk, in Shropshire.

21,535. You have generally been in lead mines?—Yes.

21,536. What end were you in to-day when you experienced the smell to which you have referred in the Rheidol mine, where you said that it was very bad?—In the 12 fathoms level.

21,537. How far are you in there from the rise?—We are in from the shaft there about 30 or 40 fathoms.

21,538. Without any blast at all?—We have a blast, but it is not powerful enough to drive it back quick enough.

21,539. It is a poor blast?—Yes.

21,540. The machine is poor?—The pipe is not large enough.

21,541. It will not throw in air enough?—No; I would never recommend a wooden pipe, but I would always recommend a metal pipe.

21,542. You spoke of the ill health of the miners; which do you think that it arises most from, checked perspiration, or bad air?—Bad air; I am quite certain of it.

21,543. Yours is a dry mine, you say?—Yes.

21,544. Do you blast much?—Yes, it is all blasting ground.

21,545. Do you bore above, and below, and sideways, and all ways?—Yes, every way.

21,546. Do you think that the miners suffer much from dust in the boring?—Not so much as from bad air.

21,547. But do you think that they suffer at all from dust?—Yes, a little.

21,548. Have you seen them in other mines suffer much from dust?—Yes.

21,549. More than here?—No, I do not know that I ever did.

21,550. It must depend, I suppose, upon the nature of the rock?—Yes.

21,551. Am I to gather from you that from your experience you find that when a mine is poor and will not pay cost, the ventilation is generally poor?—Yes.

21,552. That is the result of your experience?—That is matter of certainty.

21,553. That if you are driving on and the ventilation is bad, and you would have to pay for a winze, the parties, looking at the expense, say "Push on; we may come into richer ground"?—Yes.

21,554. And then the men suffer?—Exactly so.

21,555. (*Sir P. Grey Egerton.*) How is your ore brought to surface, by shafts or by adit level?—By adit level.

21,556. Do you dress it on the spot?—We carry it by horses about 300 fathoms, on pails; there are two horses doing that.

21,557. They carry it to the dressing sheds?—Yes.

21,558. How many men have you employed in dressing?—We have about 20 boys and girls.

21,559. At what age do you employ the boys and girls?—We employ the boys at about 13, 15, and 16, and the women perhaps at about 20 or 25.

21,560. What wages do they get?—The women get about 1*s.*, and the boys get about 8*d.* and 10*d.*

21,561. You have sheds for them to dress the ore under?—Yes.

21,562. They are protected from the weather?—Yes, there are not better in Cardiganshire; and there is not better machinery in Cardiganshire than I have.

21,563. (*Chairman.*) Are the men paid regularly?—Regularly every month.

21,564. How much do you keep in hand?—A month is kept in hand; when they are paid one month there are two months pay due, but they get cleared off with one.

The witness withdrew.

Captain JAMES RAW, of Cwm Ystwith, examined.

Capt. J. Raw.

21,565. (*Chairman.*) Of what mine have you charge?—Cwm Ystwith.

21,566. Have you charge of any other mine?—None.

21,567. How many men have you working underground?—About 150.

21,568. How do the men enter the mine?—Mostly by levels.

21,569. What is your longest level?—I suppose the longest level which we have is nearly half a mile; about 800 yards.

21,570. About how many other levels have you?—We have a great quantity of levels; I suppose we have something like eight or ten adit levels.

21,571. What is the greatest depth?—We are 40 fathoms below the bed of the river.

21,572. Do those levels all communicate?—They are all communicated one to another.

21,573. Where are you working principally now?—We are working in different levels; we are working from the adit level down to the 40 in different levels.

21,574. Are you sinking at all?—Not at present; we are driving three adit levels at present, and a 35 and two 10's. I think that we are driving five or six adits at the present moment.

21,575. In any of these levels what is the longest distance which you are driving from any rise or winze?—I think that at one of them we have not any communication the whole length of it; it is 400 fathoms, but we have a machine blowing in air with a water wheel.

21,576. You are supplying air to the extreme point of that level now?—Yes.

21,577. What pipes do you use for the purpose?—The air pipes made of zinc.

21,578. What is the size of the pipes?—Four inches.

21,579. Whereabouts is the water power?—At the end of the level.

21,580. So that the air is driven from the end of the level?—Yes.

21,581. Is it a water fall?—No, it is turned by a water wheel and a fan; we can drive it a mile, with this air; it is splendid.

21,582. (*Mr. Kendall.*) It is driven from the tail of the adit?—Yes.

21,583. What is the diameter of the wheel?—Six feet.

21,584. (*Chairman.*) Is the blast sufficient to get rid of the powder smoke at the end?—It will clear it out of the end in two minutes after a blast.

21,585. Is there anything particular in the fan?—No; it is going, I suppose, 500 revolutions in a minute; it is with cog wheels.

21,586. Have you any boys working underground?—Yes; we have, I suppose, about 30 boys out of the 150 men.

21,587. What do the boys do?—They are learning to mine; they are turning the borer and wheeling stuff.

21,588. What are the ages of the boys;—They do not go underground till they get to 14 years of age; they are kept on the surface until they are of that age.

21,589. Is it all water power on your mine, or have you boilers?—It is all water power.

21,590. Have you any accidents from blasting?—We have never had one; I have been connected with mines now for 41 years and we have only had five men killed in all that time in the mine; not one of them was killed by blasting; a storm came and killed two of them in the shaft, the pitman was one of them; that is six years ago, and we have not had an accident since.

21,591. Do the men reside near the mine?—Yes, they are close round about in the neighbourhood, none of them are above a mile off, I suppose.

21,592. Is yours a dry or a wet mine?—It is dry mining generally.

21,593. Do the men change when they come to the surface?—No, they go home mostly; we have a changing house, but they mostly go home; they live very close in the neighbourhood.

21,594. What allowance of candles have the men per week?—We give them 1½ lb. each week.

21,595. What shifts do they work?—Eight hours.

21,596. What is the charge for the candles?—7*d.* a pound.

21,597. And what for powder?—8*d.*

21,598. Is there a doctor attached to the mine?—Yes.

21,599. Is he appointed by the men?—He is appointed by the miners themselves; they pay 6*d.* a month towards him.

21,600. Is that 6*d.* for illness as well as hurt?—It is for everything.

21,601. Does it include their families or only themselves?—Only themselves, but they mostly have families who are working on the surface, and the doctor mostly attends the whole family for it.

21,602. What are the gettings of the men per month?—The average is about 3*l.* a month.

21,603. Do you pay the men in notes or in silver and gold?—In silver and gold.

21,604. You have resided for a long time in the locality; do you know many of the mines in the neighbourhood?—I have known them all in this part, within 10 or 12 miles or almost 20 miles; I have resided in this part of the country now for 41 years.

21,605. Are there a number of mines worked by small companies?—Yes, a great number now more so than there used to be; very few were working when I first came into Wales, but there are now a great quantity in the neighbourhood.

21,606. Do you think that they are well worked?—I think that they are generally; some very good companies are laying out a good deal of money; some of them are fortunate in finding lead, and some are not.

21,607. Do you think that they attend to the proper ventilation of the levels?—I think that they do; I have not heard any complaint.

21,608. Do you think that the men suffer at all from working in the mines here?—No we have not a sick man in the list; we had one surface man on the list for one week, complaining of rheumatism in his limbs or something of that sort.

21,609. They do not suffer in their breathing at all?—No, except that when they come to get old I think that they get short of breath a little.

21,610. At what age do they become affected?—I do not think that they are affected until they are from 50 to 60.

21,611. You say that the air is blown into the level and blows the smoke out in two minutes?—Yes.

21,612. It blows it back?—Yes.

21,613. Is the cloud of smoke which is blown back annoying to the men at all?—No, it dies away immediately; you can hardly see in ten minutes or a quarter of an hour that there has been a blast there.

21,614. It is so fused with the air as not to be annoying at all?—Not at all annoying. That is the only level of that kind which we have; the other levels are all communicated at about every 20 fathoms.

21,615. How is the air in the other levels which have no blast?—Very good; we have communications from one level to another.

21,616. What is the greatest length which you go before you communicate?—Not more than 20 fathoms.

21,617. Do you carry good air for 20 fathoms?—Very good; there is no difficulty at all for 20 fathoms, and then we put up a rise.

21,618. Can the men do as good a day's work at 20 fathoms as they can at the commencement of the level?—I would not say that it is quite as good as at the commencement, but it is quite good enough; the candle will burn.

21,619. Can the men do as much work in a day at 20 fathoms?—I think that they can.

21,620. There is no difference?—No.

21,621. There is no difference in the price of driving?—None whatever.

21,622. Have you no lung disease among your men?—No.

21,623. Have you never had any?—I have never seen any.

21,624. Do you consider your men as healthy as the farm men in the district?—I think that they are; they live to about the same age; we have very little farming, they are almost all miners in our neighbourhood; Cwm Ystwith is a very barren place.

21,625. Do your miners of 40 look no older than the farm labourers at 40?—I do not think they do.

21,626. You have farm labourers in the country?—Yes, and I do not see much difference; I think that the miners live as long as the people in general about the neighbourhood, I do not believe that they look worse.

DEVIL'S BRIDGE, CARDIGANSHIRE.

Capt. J. Raw.

24 July 1863.

21,627. Does a miner at 50 look an old man, or not?—No; we have some very fresh men at 50; there is a difference, of course; but some of our miners look remarkably well even at 60.

21,628. (*Mr. Kendall.*) You have been 41 years on these mines?—Yes.

21,629. Have you been all that time an agent, or part of it a miner?—All that time an agent; I was brought here by Sir George Alderson.

21,630. Have you ever worked as a miner?—Yes; —I was brought up as a miner from eight years old; I worked at eight years old on the floors, and worked till I was 21 in Yorkshire. I shall be 63 in August.

21,631. Out of the 150 men and boys working underground, how many do you think are above the age of 40?—I should say above 40.

21,632. How many do you think are above the age of 50?—Not more than from 15 to 20.

21,633. Have you any above 60?—We have 3 above 60; those are the only men that I can ascertain are above 60, that is underground.

21,634. Are you ever called on to inspect other mines in this country?—Yes; I have inspected a great many.

21,635. Are there any small ventures here put on by the small men, who have not much capital?—They are generally strangers who try the mines, often gentlemen; I cannot tell what they are.

21,636. Have you any mines worked by the poor men?—No; there are none here that I know of.

21,637. They will not give a grant I suppose to poor men?—I do not know; very few I think are able to speculate here.

21,638. Taking the average of the mines which you are called upon to inspect, how is the ventilation?—Pretty good; I have only been inspecting mines just starting, and not in general, mines of a long standing.

21,639. You have not inspected any deep mines?—No.

21,640. (*Sir P. Grey Egerton.*) The men pay 6*d.* a month to the doctor?—Yes.

21,641. And for that he attends to accidents as well as illness?—Yes.

21,642. Suppose that two of a family are employed in the mine, do they each pay 6*d.*?—Yes; father and son, if he is working underground.

21,643. If any of the children are working, do they pay 6*d.*?—3*d.* a month on the flooring.

21,644. And for that the doctor attends both the men and their families?—He attends the whole family for that.

21,645. How many have you employed on the surface?—I should think that there are about 140 or 150 young persons on the flooring besides carpenters.

21,646. How many have you employed above ground altogether?—Something like 150; we have nearly 300 on the mine altogether.

21,647. Do you employ boys and girls?—Yes.

21,648. At what age?—They go from nine years old up to I suppose 12, on the floorings, and after 12 or 13 the boys go underground.

21,649. Of what age are the women?—Of all ages.

21,650. What wages do they get?—10*d.* a day the best of the women, and the boys in general get from 8*d.* to 1*s.*, just according to their age and strength.

21,651. The women pay 3*d.* to the doctor of whatever age they may be?—Yes.

21,652. Have you sheds for them to work in?—Yes; we have very good sheds in our mine; they can work on a wet day every bit as well as on a fine day.

21,653. Taking your miners as a body, do you think that they are temperate men?—Very; in the last eight or ten years, very few of them have drunk anything at all, except a few of the young men of 20, and so on; almost every one of our miners is a teetotaller. It is a great place for teetotallism.

21,654. (*Chairman.*) You are acquainted with the smaller mines; is the pay of the men regular in the smaller mines?—There are some complaints that they do not pay the miners very well; they miss a month or two, and something like that sometimes in some of the smaller mines.

21,655. You think that the men complain of that?—They do rather.

The witness withdrew.

Mr. HENRY THOMAS, of Aberystwith, examined.

Mr. H. Thomas.

21,656. (*Chairman.*) You are general manager of the mines under the charge of Messrs. Taylor?—Yes, general superintendent.

21,657. How long have you been so?—I have been here about 2½ years. I have been in Spain for them for many years, and down at the Parys Mines in Anglesea.

21,658. How many mines altogether are there in this district which you manage for the Messrs. Taylor?—Eight, taking the group of the Lisburne Mines as one.

21,659. But there are several other mines worked by small companies in this district?—There are.

21,660. Do you know anything of them?—But little. I have been called in once or twice, but I have not had an opportunity of seeing many of them.

21,661. In the mines under your charge is the pay of the men always once a month, with a month in hand?—Yes.

21,662. Do you know anything about the cottages where the men live?—I have been in some of them.

21,663. Of what description are they?—They seem generally very poor indeed.

21,664. Do they generally belong to proprietors or to the men?—The men build a great many themselves, and there are a great many also held by proprietors.

21,665. Do the captains under your charge represent to you when the ventilation of a mine is not good?—Yes. We generally discuss the various bargains which are set, and all these points arise in the discussion of the workings, and we make the arrangements accordingly.

21,666. What kind of machine do you generally recommend to be adopted for ventilation?—We always use, and find them effective, fan blasts attached to pipes for forcing the air into the levels; but there is rather a difference of opinion about that, whether the air should be extracted or forced in. Many people like the one more than the other. I rather like exhaustion best myself, but there is no specific plan. We find that the one which we generally use is very effectual, which is that of forcing the air in. We take care to keep the pipes very tight.

21,667. What sized pipe do you use?—We generally use 4-inch pipes.

21,668. Of what material?—Galvanised iron or cast iron pipes when we have a stock of old pipes on the mines, but all the new pipes which we apply are galvanized iron pipes. They are very thin and light.

21,669. Which are about the deepest mines that you are working in this district?—One of the deepest mines is Frongoch. It is nearly 103 fathoms from the surface. It is now idle from the scarcity of water to work it.

21,670. Is the water now in?—Yes.

21,671. You depend upon a water wheel to pump it out?—Yes. We have it in contemplation to erect a steam engine there. East Darren is quite as deep; that is 116 fathoms down. There we are more regular in the work. We have a steam engine.

21,672. (*Mr. Kendall.*) I find that under the head of Lisburne Mines there are six mines named?—Yes.

21,673. You said that there were eight mines of Messrs. Taylor in this neighbourhood?—Yes.

21,674. Then the Lisburne group must count as one ?—Yes.

21,675. In all the Taylor mines that you have anything to do with you have the same system of pay ?—Precisely.

21,676. And also great attention is paid to the ventilation ?—As much as we possibly can.

21,677. I suppose you find that although ventilation is a very costly matter yet in the end it is a more economical mode of proceeding ?—Yes, unquestionably. The power of the miners is so much improved by it. You cannot get half the work from a man working in an ill-ventilated place.

21,678. Before you went to Spain did you at all superintend mines or work in mines ?—Yes.

21,679. Were you brought up as a miner ?—No, but I was always attached to mines. I was brought up at Penzance in tin smelting.

21,680. Are you a Cornish man ?—Yes.

21,681. When you were in Penzance were you mixed up with mining matters ?—No. I was with tin smelters there. After that I had a good deal of experience more, in Ireland and with London Companies working mines in Cornwall.

21,682. When in Cornwall did you pay much attention to the tin miners there and observe their state of health at all ?—Only generally.

21,683. Can you give an opinion as to the relative state of health of the miners there and of the miners here; which do you think are the healthiest class, those in this district or in Cornwall ?—I have not compared them, and therefore cannot say; we want statistics here, we are very short of sanitary statistics.

21,684. As far as the miners go in this district, are they a healthy looking class of people ?—They are not a healthy-looking class of people at all.

21,685. Can you distinguish as you go along the difference between a miner and an agriculturist ?—Not always, for the agriculturists do not look very healthy themselves.

21,686. What do you think that arises from ?—I attribute it to their imperfect cottages, they want more ventilation in their homes; most of the people in this country get a very sallow look.

21,687. Their habitations are poor ?—Most of them.

21,688. And very confined ?—And very confined; they only live in one room, or one room is divided by partitions of linen.

21,689. Have you ever gone into any of the miners' cottages ?—Yes.

21,690. Do they sleep many in a room ?—Yes, they do in many cases, divided in that way.

21,691. By simple sheets ?—By simple sheets; by blue and check cloth, which is very common.

21,692. You can see that their mode of ventilation is very imperfect ?—Extremely so.

21,693. Perhaps more so than underground ?—I fully believe it; I have a strong opinion on that matter. In many of the houses the windows only consist of one small pane or two or three small panes and without any means of opening them; they are completely built in.

21,694. Are any of the bed rooms up stairs without chimneys ?—I do not know. I am afraid there are very few bed rooms up stairs; there are some little lofts and some bed rooms up stairs.

21,695. What are the floors of the cottages ?—They are more often than otherwise of clay, and a sort of bog; sometimes you may sink into it if you sit down on a chair. I was in a bed room the other day of that kind where the agent of a mine was living.

21,696. Are these cottages built by the miners or let out by the proprietors ?—The miners build when they can, whenever they can get a little money to do it.

21,697. Do they build on leases for lives or on long leases ?—I think very often on long leases, and sometimes merely as yearly tenants at rack rent.

21,698. What do these cottages cost to build in your opinion, take a cottage 16 feet long by 12 fee wide ?—Perhaps 40*l.* or 50*l.*

21,699. Will they build such a cottage as that at their own cost without a deed ?—Not always; they sometimes get an allowance from the landlord as well, in the shape of timber; the landlord frequently supplies the timber and stone, they paying the carriage and doing all the labour of building; that is frequently done, but it is generally under some agreement; I do not apprehend that it is very often on lease.

21,700. However, be that as it may, the cottages are very bad, and the ventilation in them is very bad ? Yes; a better class of cottages is springing up now, the new cottages which the men are building.

21,701. (*Sir P. Grey Egerton.*) You are the general superintendent for Messrs. Taylor's mines in this district ?—Yes.

21,702. Have you captains under you for each mine ?—Yes.

21,703. Do you often visit the mines yourself ?—Yes, very often.

21,704. Do you go underground ?—Yes, occasionally.

21,705. Supposing that you are driving a new level, do you trust to the captain of the mine to inform you if the air is getting bad in that level, or do you satisfy yourself upon that point ?—It becomes a matter of general discussion; we always take the plans before us, and we consult as a body on those matters; we generally do it by a full examination of the plans and the distance of one winze from another, and they generally mention it in the first place; but when I go underground if I saw that the air was bad I should make a point of mentioning it myself, and we should talk the question over. Sometimes the necessity occurs to them, and more generally to them, and sometimes to myself, but I believe it is never omitted to be mentioned.

21,706. Supposing you are yourself satisfied that the air in a certain working is bad, have you the power of remedying it without applying to your superiors ?—Yes, certainly.

21,707. Are there cases where you do give an order for applying artificial ventilation where you think it necessary ?—It would be so if there was any question between me and the captains.

21,708. I am supposing that the air is bad ?—I should not generally interfere in that proceeding individually; it would become a matter of discussion and of general agreement with the captains themselves; we generally work in that way.

21,709. But as general superintendent, is it in your power to order an apparatus to be put up ?—Yes, I could do it.

21,710. (*Mr. Kendall.*) Without consulting the adventurers ?—Yes. I speak of such machinery as we are in the habit of applying in this country; I do not mean to say steam engines, and large water wheels, and those heavy things; but I mean a small apparatus, air pipes, and so on.

21,711. Is it the general system of Messrs. Taylor to have working plans kept up at all their mines ?—Yes.

21,712. So that you can consult them at any time ?—Yes; you can refer to them at any time you like.

21,713. (*Mr. Holland*). Are the miners' cottages much like the agricultural labourers' cottages ?—Very much the same, I think.

21,714. Which do you think are the best; is there any difference ?—I do not think that there is much difference.

21,715. Have they generally two rooms or not ?—Sometimes only one, I believe; generally two, I think.

21,716. Two or one imperfectly divided ?—Yes; I have seen that.

21,717. Have they fire-places or chimney corners with a large chimney ?—Yes; that is their best means of ventilation, sometimes so much so that it is extremeyl cold.

21,718. Are the cottages generally weather tight ?

DEVIL'S BRIDGE, CARDIGANSHIRE.

Mr. H. Thomas.

24 July 1863.

—No, I think not; that is to say the exceptions are very numerous.

21,719. Are they generally thatched or slated?—They are now more generally slated.

21,720. (*Sir P. Grey Egerton*). What provisions are there for the education of the children; are there national schools or private schools?—There are private schools which are attached to the mines; they are paid for by a sort of subscription from the miners, themselves. At Lisburne mines we retain 1*d.* per month from the miners, which is handed over to the schoolmaster in the ordinary way; and the schoolmaster gets that, and gets paid by other people in the neighbourhood, so that he makes a small living of it; he is not one of the certificated masters.

21,721. Is any support given by the owners?—Yes; the mine subscribes something.

21,722. Messrs. Taylor subscribe in addition to the penny subscriptions of the men?—Yes.

21,723. So much a year?—So much a year.

21,724. To the salary of the master, or do they nominate a certain number of children?—To the salary of the master. We can supply all these data accurately.

The witness withdrew.

Captain THOMAS BALL, of Level Vawr, near Aberystwith, examined.

Capt. T. Ball.

21,725. (*Chairman.*) Of what mines have you charge?—The Lisburne mines.

21,726. Does that include the group?—Yes.

21,727. About how many men have you working altogether in that group underground?—Somewhere about 300 miners; the number varies; it is sometimes more and sometimes less.

21,728. Are there any boys amongst them?—Yes; some.

21,729. What is the youngest age at which you allow them to go underground?—I do not know that we have any general rule for that; they go down to the little fan machines, but they walk in; and the parents take down their children very young now; we have some at 10 years of age, and I think that there are some under; I am not certain as to that.

21,730. Are most of the men working now by tribute or tut work?—The greatest number are on tribute, but we have increased our tut work lately.

21,731. What is the principal work which you are doing, are you driving?—We drive our levels and sink our winzes, and then stope the valuable ground.

21,732. At what ground are the largest number of men working at Level Vowr?—The principal part of the men are working away in the sides above the 60 fathoms level.

21,733. What is the deepest part?—130 fathoms.

21,734. Take the 103 fathoms level, namely Glog Fach, have you any artificial means of ventilation?—Not at that level.

21,735. At what level have you to use artificial means of ventilation?—We had a fan machine at the 73, and for the last two or three days before your Lordship came there, we threw it away, and put in a trap-door for ventilation, but it failed; we had to apply the machine again.

21,736. Have you done anything with respect to the shaft where the men complained of the air when sinking the shaft?—Yes, there is plenty of air there.

21,737. How have you remedied that?—We have fixed a blast machine, and when there is any wind there is plenty of air, and when there is no wind they put the fan machine to work.

21,738. What distance is Level Vowr driven?—700 fathoms from the mouth, but 240 from the point of ventilation.

21,739. How do you ventilate the end of that?—With a fan blast.

21,740. How is it worked?—With a 12 feet water wheel.

21,741. Whereabouts is it placed?—About 30 fathoms east of Addy's shaft; the current comes in, it is at the side of the level.

21,742. And you find that that gives plenty of ventilation?—Yes, it gives plenty of ventilation for the men to work, and we generally find that it clears the smoke.

21,743. What do the men pay for candles?—9*d.*

21,744. And what for powder?—8*d.*

21,745. What allowance of candles have they per week?—2 lbs. per man.

21,746. What number of hours shift do the men work?—Eight.

21,747. Have you any women working on the mine?—Yes.

21,748. Who is the doctor attached to your mine?—Dr. Rowland.

21,749. Is he appointed by the company?—He is appointed by the men, it is the men's choice.

21,750. What deduction is made from the men for the doctor?—Sixpence per man per month.

21,751. Does that include sickness as well as accident?—It includes the family.

21,752. Who keeps the account of the collection of the sixpences?—It is kept in the cost book, it is deducted from the men's wages and handed over to the doctor. It is 6*d.* only, nothing extra for attendance of families.

21,753. Is the account kept at the mine?—Yes, and it is deducted the same as any other material.

21,754. (*Mr. Kendall.*) How long have you been under Messrs. Taylor here?—I have been under Messrs. Taylor all my life, but I came here in 1839.

21,755. Where did you work before you came here?—I worked in Wheal Betsey and Wheal Friendship; I worked at a mine from boyhood.

21,756. You worked your way up to your present position?—Yes.

21,757. How long have you been an agent?—About 27 years.

21,758. Was Wheal Friendship a very well ventilated mine or not?—It was considered so then.

21,759. What depth did you ever work there?—To the 210; I only worked very little in Wheal Friendship; Wheal Betsey was my spot.

21,760. Did you ever work as deep as the 210?—Yes.

21,761. Do you recollect how long it took you to get up or down there?—No, I am not prepared to answer that, but we used to follow up the machine waggon; the lode lay pretty flat there, we could run as fast as the waggons; about a quarter of an hour, I should think.

21,762. The lode is very much inclined there?—Yes.

21,763. The underlay of the lode is very rapid, how many feet in a fathom?—I do not recollect.

21,764. You could run up?—Yes, pretty easily on the ladders.

21,765. Were the miners there a healthy class of men?—I do not know that there was much complaint about their state of health.

21,766. Can you draw a comparison between the men there and the men here; which are the healthiest men?—I think that the men here are the healthiest.

21,767. Do the men here work as long as they did there?—I do not think that the men here work as hard as the others did nor as many hours; I have never seen such hard working men out of Cornwall or Devon as I have in it.

21,768. You mean the Cornish men?—Yes.

21,769. Did you ever work in Cornwall?—I did work for two months at the Great Fowey Consols. That is all my experience in Cornwall.

21,770. (*Chairman.*) Do you know anything of the other mines in this district, the smaller mines?—I do not know much about them; I have been out in Spain six or seven years, and I have been up in North Wales also.

The witness withdrew.

Captain Robert Northey, of Bwlch Consols, Goginau, examined.

Devil's Bridge, Cardiganshire.

Capt. R. Northey.

24 July 1863.

21,771. (*Chairman.*) Of what mine have you charge?—I have charge of Gelley Riern and Bwlch Consols and Bwlch Stylleu.

21,772. About how many men altogether have you working under ground at these different mines?—I have about 18 or 20 at Gelley Riern, and about 35 at Bwlch Consols, and six at Bwlch Stylleu; we are doing nothing there but sinking a shaft.

21,773. What is the depth of the shaft which you are sinking now?—It is now sinking under the 24.

21,774. Have you any means of ventilation there for the men?—I have a duck machine 12 feet long which will give air enough for any 500 men in the world; the men can work there as well as they can out in the street.

21,775. What is the longest level which you are driving in Gelley Riern?—About 200 fathoms.

21,776. How far is it driven from any winze or rise?—There are only two men working in it. It is driven I should think from 70 to 80 fathoms from any winze or rise.

21,777. They only work eight hours in the 24?—They only work just as they please; they never stop there after the blast; they do not complain a bit of the air.

21,778. They only work a few hours there?—Just so.

21,779. There are no artificial means used there?—No.

21,780. Do you think that the men suffer at all from working in bad air?—I do not think they do in this county; in Cornwall they do; I have suffered from it, and suffer from it to this day.

21,781. Are you affected in your breathing?—No, but I am dreadfully rheumatic in consequence.

21,782. Where did you work?—In the Great Consols about seven years, and I worked in East Wheal Rose, and I worked in Wheal Penrose.

21,783. How long is it since you worked in Cornwall?—I have been to America since then; I should say that it was 22 years ago, but I have been an agent in Cornwall since then.

21,784. At what mine?—The Allemanner mine in Gowl Sithney Parish, for a very short time; I did not like it.

21,785. Do you think that the men working in Cornwall are more affected than those in this district?—Yes, the mines are a great deal deeper and hotter where I have been; I have also worked in Devonshire under Dartmoor, and in the Polberrow Consols, and elsewhere.

21,786. Have you had anything to do with any of the other mines in this neighbourhood?—I am opening a little mine, but I am not doing anything underground, I am only working upon the surface.

21,787. Are you working by tutwork principally?—Principally.

21,788. How is the pay of the men, is it a month in hand?—A month in hand.

21,789. Are they paid regularly every month?—I never missed a day in my life; I would not have anything to do with the mif the Company did not forward me the month's pay.

21,790. (*Mr. Kendall.*) What is your age?—I was born in 1818.

21,791. You worked in East Wheal Rose mine and in the Great Consols; at what depth did you work in the Great Consols mine?—I worked in the Great Consols mine down to the 210.

21,792. While you were there was the heat too great before they connected with the shaft and got air?—I worked in the sumpt shaft as we term it, the engine shaft. Th y always sank two shafts there, about 15 feet one from the other, and they would go down both together, and there is always ventilation there.

21,793. Was it very hot there or not?—I often worked without a shirt.

21,794. Did you catch cold when you came up to the surface, did you suffer from it?—I suffered from it as to rheumatism, and I do so to this day.

21,795. In consequeuce of the change of atmosphere, and so on?—Yes.

21,796. You had good changing houses there, had you not?—Yes, and a good fire; but, doing the best we could, we suffered in that way.

21,797. How deep did you work in East Wheal Rose mine?—About 160 fathoms.

21,798. That is a lead mine?—Yes.

21,799. From your experience is the air different in a lead mine from what it is in a copper mine?—I am certain that the atmosphere is much more cold in a lead mine.

21,800–1. But how is it as far as the air goes?—I do not know that there is a great deal of differenee, I should rather take a lead mine if I was going to work in a mine, because it is cooler.

21,802. At the same depth?—At the same depth.

21,803. With regard to air, from your experience can you speak as to the smelling of bad air?—Yes.

21,804. Can you detect it?—Yes.

21,805. I do not mean the air from the powder smoke?—No, I can detect bad air, I could not detect air a little impregnated.

21,806. Can you detect bad air before the candle begins to detect it by burning dimly?—Yes, you can tell it by the exertion of your body, if you are working in it.

21,807. Your body feels languid?—Yes; I can hardly describe the feeling.

21,808. And then you at once know that there is bad air?—Yes, I can tell it in a minute.

21,809. With the candle burning well?—Not well, you could not move the candle with the dexterity that you could in good air, without its going out, but still it would burn.

21,810. Could you at all detect the bad air before you could see any difference in the candle?—We should say that the air was close; we should not call it bad.

21,811. The air is close even before the candle begins to show any signs of it?—Yes.

21,812. (*Mr. Holland.*) Do you feel a diminution of strength from the air being bad before the candle shows it?—Not in youth; I should now, I suppose.

The witness withdrew.

Captain Nicholas Bray, of Llwynmalees Mine, Tregaron, Cardiganshire.

Capt. N. Bray.

21,813. (*Chairman*). How long have you been in Wales?—From 10 to 12 years.

21,814. Of what mine or mines have you charge?—Llwynmalees mine, and one in Pembrokeshire.

21,815. How many men have you working underground in Llwynmalees?—Until the last fortnight or three weeks I had about 24 miners; but we are now suspended in consequence of being short of water.

21,816. You depend upon the water for pumping?—Yes, altogether.

21,817. What is the lowest level?—46 fathoms from the surface.

21,818. Do you go in by the day level?—No; we descend by shafts.

21,819. Before a water stopped you, were you driving or sinking?—Driving.

21,820. Are the men principally on tut-work?—tut-work and tribute, six are on tribute.

21,821. How far were you driving from any winze or shaft?—We have two shafts down to the bottom level; the 46 fathoms level; they are about 40 to 45 fathoms apart, but our furthest winze for ventilation is about 30 fathoms.

21,822. Are you obliged to employ any artificial

DEVIL'S BRIDGE, CARDIGANSHIRE.

Capt. N. Bray.

24 July 1863.

means, or can you do without it?—We can do without it; we have ample air, because we have a current of air passing from one shaft to the other; at the fore breast the air is as pure as it is here.

21,823. What do the men pay for candles?—I charge them 6*d.* per lb.

21,824. And how much for powder?—The same; it does not make any difference, because if we charged more for candles, we should have to give them so much more per fathom, to allow the men to have their wages.

21,825. What are the gettings of the men?—From 3*l.* to 3*l.* 5*s.* a month, perhaps 3*l.* 10*s.* sometimes. I dare say that our men will average from 3*l.* to 3*l.* 10*s.*; we generally set the work at about 15*s.* a week, a little over rather than under.

21,826. Have you any boys working below?—Yes.

21,827. With their fathers or alone?—I really cannot say as to that.

21,828. What age is the youngest?—I should say that our smallest boys are from 12 to 15.

21,829. (*Mr. Holland.*) Do you work chiefly levels from one shaft to the other?—Yes; we have ventilation from one shaft to the other.

21,830. Have you any close air from one to the other?—No; I had a machine to push in air from the 36 to the 46.

21,831. Does that machine enable you to keep pure air the whole time?—Yes, it will drive the smoke back.

21,832. Is one shaft up-cast and the other down-cast?—No, it depends upon the wind; sometimes you see the smoke going up the lowermost one, and at other times up the highermost one; one is a little higher than the other.

21,833. (*Mr. Kendal.*) Have you worked in Cornwall at all?—For many years; I served my apprenticeship there.

21,834. Where did you work?—In the United Mines, Wheal Buller and the Great Consols, in Gwennap.

21,835. You have been in some of the deep mines in Cornwall?—Yes; I suppose the United is one of the deepest in Cornwall.

21,836. Can you say at what heat you were working?—I cannot say; we had a hot level, and one day the thermometer stood at 106°.

21,837. Did you work without your shirt?—I never worked there. It was very cold where I was working.

21,838. How many years have you been mixed up with mining matters, both as agent and otherwise?—From 10 years of age up to the present time.

21,839. How old are you?—I am about 38 now.

21,840. Then you have had nearly 30 years experience?—Yes, and not only that but my father before me. I can say that I was bred a miner.

21,841. Is more attention paid to ventilation now than there used to be when you began?—I think there is on the average. Miners now, I think, will not work in places where they worked formerly.

21,842. They are sharper?—They are not only sharper but they have more means now. Persons can emigrate to some other place.

21,843. They are better off?—Yes.

21,844. They are more independent?—They are more independent than they were in my younger days, I think. When I was a lad if you did not work there you might go, and you would find some difficulty in getting a situation elsewhere.

21,845. Ventilation is forced on the adventurers more than it used to be?—I think the mines are better ventilated on the average.

21,846. Taking the Cornish men and the men here, as far as health goes, do you see any difference?—I see but very little difference, except that I do not think that they live quite as well in this country as they do in Cornwall.

21,847. Which men work hardest?—If you lay out a bait for a Cornish man, I think he will work a little harder than a Welchman will on the average.

21,848. But he must be paid better?—He must be paid better, certainly.

21,849. You have not been in Cornwall for a long time, have you?—I think it is about five years since I was down there.

21,850. Which is the most temperate miner of the two, the Cornish man or the Welchman?—I do not think there is much difference.

21,851. Wages are lower here than in Cornwall, are they not?—I cannot say what are the average wages in Cornwall.

21,852. (*Mr. Holland.*) Are men more awake to the necessity of ventilation now than they were when you were a youth?—That I really cannot say. If the air is a little impure, men complain, and then of course we rectify it as soon as possible; and not only that, but there cannot be a better mine than ours is at the present moment, because we have two shafts down drawing from one shaft to the other.

The witness withdrew.

Mr. ROWLAND ROWLAND, of Strata Florida, near Tregaron, examined.

Mr. R. Rowland.

21,853. (*Chairman.*) Are you the appointed medical man to any of the mines in this neighbourhood?—I am to nearly the whole of the mines on the south side of the river Rheidol.

21,854. What arrangement is made with you for attending the miners?—I am paid 6*d.* per man per month.

21,855. Are the company responsible to you, or do the men pay you?—The company pay me.

21,856. They do not guarantee you a certain sum?—No.

21,857. How are you elected?—I was appointed by the company in 1841, and I have continued to attend the mines ever since.

21,858. Are there any other doctors resident in this district besides yourself?—There is no doctor resident in this immediate district but myself. My brother has the north side of this river, and this river is our boundary. My son assists me; he is a qualified practitioner.

21,859. By that arrangement do you attend the miners in case of sickness as well as accident?—Everything.

21,860. And their families?—Their wives in every case but midwifery, and I am paid only half a guinea for midwifery, because I am in the pay of the company.

21,861. Do you attend others in the district besides miners?—Yes.

21,862. Do you see any difference in the health of miners and others?—I think I do.

21,863. In what way should you say the miners are affected differently from others?—I think that it is in consequence of inhaling air containing particles of matter. I think that that is the cause of it, and the effect is that they are pale and more subject to coughs, and they decay sooner than agricultural labourers.

21,864. Do they come to you in an early stage of the disease?—Yes, they come directly.

21,865. Have you had any cases under treatment where you have been able to give entire relief?—Yes, a great many—when they come early I very often give, when they work underground a great deal, an emetic or ipecacuanha, not that I think it will evacuate anything from the lungs, but still it has the effect of causing a discharge from the numerous membranes of the lungs, and I give them expectorants, and they throw off the foul matter which has been inhaled by working in foul air.

21,866. Do you consider that their digestion or the organs of the stomach are affected by their work?—I think that the lungs are more affected than even the stomach.

21,867. But does it show itself in any way by an

affection of the appetite or in their general state of health ?—Yes, I think that they do not eat so heartily as the agricultural labourers.

21,868. Do you ever recommend them not to work at the mines ?—Very often; I am obliged to tell them that, and they know it now themselves. When they are beginning to be affected underground they say, "what do you think about my working underground ?" I reply, well really I think you have now worked for many years underground and your breath has become short. I recommend you to try to have something to do on the surface or to go out to work with the farmers; and if they do that the recover themselves a great deal, but if they go back to the mine they very often die in less than 12 months.

21,869. Should you say that the life of the miners is shortened by their work ?—Decidedly; I think from my observation of the last 20 years or more, that 10 years would be taken from the life of a man of 60; a man of 50 as a miner would be as old as another man of 60.

21,870. Do you think that there is any difference from a man beginning as a miner at a more mature age ?—Yes, I think that the agricultural men will stand it best. I do not think that being accustomed to it like an apprentice is a good thing. I think that they die sooner if they go earlier, that is my observation. I have no particular statistics, but I know that people who have been in agricultual labour till they grow up pretty strong stand it best; that is may experience.

21,871. You have been here 20 years; do you see any improvement or otherwise with regard to the health of the miners ?—The mines are worked a great deal more extensively now than they were 20 years ago, and the mines have been only in working about 25 to 27 years, and then there were fresh people coming, and the effects of working were not so apparent then as they are at present. I think that it is progressing rather if anything, because people have been more underground, more at it; mining was fresh in those days.

21,872. Have you ever been underground yourself ?—Yes.

21,873. Have you ever yourself perceived where the air has been bad ?—Yes, very much.

21,874. From the sensation which you experienced there, should you say that it was likely to affect the men there ?—Yes, certainly. If the air was rather confined without plenty of circulation, it would be very unpleasant indeed to go to an end for an hour or two.

21,875. Do you think that the impurity of the air arises from any deficiency of oxygen, or from the powder smoke and other impurities in the mine ?—I think that the sulphurous acid would be the principal thing. I do not think that they are so confined as you are when breathing in a public room. I think that the mischief does not arise so much from the oxygen being consumed as from the deleterious effects of the powder smoke and the dust.

21,876. Do you think that there is much dust in these mines ?—Yes, a considerable deal.

21,877. And you think that likely to affect the men ?—I think it is very likely to affect the lungs, and to bring on bronchial affections.

21,878. Do you think that they are more likely to get cold on coming to the surface ?—It is their own fault. I think that they do get cold; I have known many instances where they have done so. The mines provide a changing room for them, and from the smith's shop there are large pipes to throw their clothes over, but lately the people have wanted to throw something over their wet clothes and go home as they are; they would rather change at home. They have not attended to that as much as they might have done.

21,879. And therefore the state of their health predisposes them to cold if they do not take care ?—Yes, if they do not take care.

21,880. (*Mr. Holland*). Are the men often hot as well as wet when they come up from the mine ?—No, these mines are not hot.

21,881. There is not much climbing in them, is there ?—Not as a rule; our mines are not worked deep or hot.

21,882. Have some of the mines the reputation of being more unhealthy than others ?—I think that Cwm Ystwith on the whole, may be, if anything, rather more unhealthy.

21,883. How does it differ from the others; what makes it more unhealthy ?—I think it is rather deeper I do not know why it should be so.

21,884. Is it more dusty than the others, or the same ?—About the same, I think. Cwm Ystwith is a little narrow valley, and people do not go out of it; and they marry one another from generation to generation; nearly all of them are Howells or Burrells, and they are rather weak people.

21,885. Have a large proportion of the miners who survive 40, the disease which you speak of ?—A great many die under 40.

21,886. Of those who survive 40, are a large proportion affected in their lungs ?—Yes, a good many from 40 to 50.

21,887. With cough and expectoration ?—With cough and an expectoration of a bluish substance from the lungs; bluish phlegm.

21,888. Have you ever been able to detect solid particles in the phlegm; have you looked for them ?—Yes, I have looked with a microscope. I do not think that I have discovered any particles of lead at all.

21,889. Have you discovered any particles of grit ?—Yes, I have.

21,890. And of carbon ?—Yes; sometimes they spit quite black for days after coming out of the mine.

21,891. How long will they spit that particular sort of black spit after leaving the mine ?—For days and sometimes weeks; but the sputa of people who have been working in mines even for two years is rather darker than usual. From that kind of bronchitis which they have, there is a darker sputa than we have in other people. I think that it is from some affection of the lungs. I have not had many opportunities of a post mortem examination, but it is a darker secretion.

21,892. Do you think that the cottages of the miners are materially different from those of the agricultural labourers ?—No.

21,893. Are they generally very small ?—They are generally very small and very dirty too, I must say; there is not sufficient care for cleanliness.

21,894. Is it common to have the window fixed in the wall so that it will not open ?—It is common to have the windows without any opening, but the doors are very often very bad, and the chimney is big, so that they have a ventilation. There is only one room generally, and the door is almost always open.

21,895. Is it common for the whole family to live in what is really one room, that is to say in one room only partially divided ?—No, not very often; they generally have two or three rooms; they have a door to go into one room, and then there is a little room at the other end, and then a little loft thrown over the building for the children to sleep in.

21,896. There are three compartments ?—Yes, that is the general average of the houses.

21,897. When those cottages are closed at night, does the air get very bad ?—No; I have seen in towns, really in large respectable houses, the air a great deal worse.

21,898. When you have attended at night have you been annoyed by bad air ?—No, not much; there is cold air coming in through crevices.

21,899. (*Sir P. Grey Egerton.*) What is the general health of the population of this district apart from the mining population ?—The health is pretty good.

21,900. What are the prevalent diseases ?—We have all diseases. Sometimes we have epidemics, such as scarlet fever; many years ago we used to have more fevers than we have now; we do not have many fevers now. We had a very bad epidemic, the

DEVIL'S BRIDGE, CARDIGANSHIRE.

Mr. R. Rowland.

24 July 1863.

scarlet fever, at Cwm Ystwith a few years ago; I think that it was entirely from contagion, it came from another place; one family went to a funeral and brought it home and got ill, and then it followed from one side of the river to the other, and then one family came from the hill a long distance to this side, and it spread.

21,901. Did it spread among the mining population as much as among the other inhabitants of the district?—Quite as much.

21,902. Have you much phthisis among the poor people here?—Yes, we have a good deal of phthisis.

21,903. Do you find that miners are as subject to tubercular disease as the people who work upon the surface?—Quite as much. We cannot always distinguish; there is a bronchial ulceration of the lungs, with difficulty of breathing, and cavities forming, so that we do not know exactly whether it is from original phthisis or whether it is from ulceration from particles.

21,904. Would not that rather be called emphysema of the lung?—Emphysema would be from ulceration and wind getting into the vesicles.

21,905. Have you ever seen a case of miners' asthma graduating into phthisis or terminating in phthisis?—Yes, I have.

21,906. Is that common?—No. I have had it in people from 40 to 45. I have seen some cases of it.

21,907. Have you ever seen such a case where tubercular disease has not been constitutional in the family?—Yes; I have had a case lately, where a man died. He was a miner, and I think that he was very healthy till he worked in the mines, and then he became phthisical; he was a Cornish man.

21,908. Did any of his family die of tubercular disease?—I did not make much inquiry as to that. It is almost impossible to decide whether they are phthisical or asthmatic; for a long time they feel as if they are asthmatic, but from that they get phthisical.

21,909. Would not an examination by the stethoscope give you the diagnosis of the two diseases?—Yes, but not distinctly enough; we cannot trace it now; any consolidation of the lung would be very nearly the same as tubercles.

21,910. But you could distinguish between hepatization of the lung and abscess of the lung by the stethoscope?—Yes, that would be nominally.

21,911. Do you ever find the miners disease complicated by heart disease?—Yes, in some cases we do.

21,912. Of what description is the heart disease—is it hypertrophy of the heart or valvular ossification?—We have a good deal of rheumatism, and therefore have valvular disease in miners in consequence of it. They are exposed to cold, and then their hearts get affected; but I know that we have the diagnosis also of hypertrophy in the miners' consumption, but I do not think that we have many cases of it. I think that ventilation in the mine is the great thing which we want. If we have sufficient ventilation, I think that that is the thing which we particularly require.

21,913. (*Mr. Holland.*) How would you guard against the dust?—It would blow the dust away.

The witness withdrew.

Mr. EVAN ROWLAND, of Goginau, near Aberystwith, examined.

Mr. E. Rowland.

21,914. (*Chairman.*) How long have you been in this locality?—About six years.

21,915. What mines do you attend as medical man?—Goginau, Cwm Erfin, Cwm Sebon, Bron, Floyd, Bwlch, and other mines.

21,916. Do you make the same arrangement with all?—Exactly the same with all of them.

21,917. Will you state what the arrangement is?—My arrangement with them is 6*d.* per head per month; that is my pay.

21,918. The company secures that to you?—Yes; I get it from them every month.

21,919. Does that apply to attendance for sickness as well as hurt?—It is for sickness as well as hurt; for the man who is working, but I am obliged to supply medicine for the wife and family, but no attendance.

21,920. Do other patients come to you besides miners?—Yes, a good many.

21,921. Agricultural patients?—Yes, a great number.

21,922. Have you an opportunity of comparing the different classes?—I have, so far as my experience goes.

21,923. Do you think that the miners are subject to any peculiar disease?—They are subject to a cough which I believe is brought on through damp and foul air at times.

21,924. Do you find it prevail to any extent?—Not a great deal.

21,925. Do they come to you in the earlier stages of the disease?—They come when they begin to cough.

21,926. Are you able to relieve it?—Yes, in a great measure.

21,927. Do you ever find cases where you recommend them to give up working?—Very few; at Goginau and that neighbourhood, they are more birds of passage; they are not the same as they are on this side, brought up in the neighbourhood, and living here; very few people live at Goginau now who were living there 20 years ago.

21,928. Are they Welsh?—Most of them are Welsh, a good many are Cornish.

21,929. Do you see any difference between a man going to work there young, being trained up to it from a boy, and one who begins it at a mature age?—Not a great deal in our mines, most of them are very well ventilated.

21,930. Have you ever been down yourself?—Yes; I have been down Goginau, and Cwm Erfin; sometimes when they are going to hole a shaft, there may be a little foul air.

21,931. In coming to you, do the men ever state what they believe to be the cause of their illness?—No, I have never heard any one say that it was the foul air which caused it; I believe that the mines with us on that side are very well ventilated.

21,932. (*Mr. Holland.*) Is there an excess of lung disease among the miners, as compared with other men?—They are more subject to cough than the agricultural labourers.

21,933. Is that cough more obstinate than with the agricultural labourers?—Yes, a great deal.

21,934. Does it come on at any particular time of life, or is it at all ages?—It comes at all ages, but I find that it comes most frequently about 40 years of age.

21,935. Do those who get to the age of 40 have habitual cough?—Yes, they are very subject to cough.

21,936. Do you think that a large proportion of the men above 40 are quite free from cough?—I believe about one half at an average.

21,937. They are not permanently ill?—No.

21,938. Do they often die of the cough?—Very seldom. I have had a little to do with different districts, and I find that the mines on our side are a great deal better ventilated taking them altogether, than in any other part of the country, I believe.

21,939. Do the men complain much of dust?—At times they do, not a great deal; there is no sulphur in the mines about here, so that they do not complain so much of it.

21,940. You know the disease which is commonly called miners' asthma or miners' consumption?—Yes, very well; I have seen it in Cornwall, but I have not met with it once in my neighbourhood.

21,941. Where have you seen it?—I saw it when

I was visiting a friend of mine in Cornwall, he showed me several cases of it there.

21,942. You have never seen the disease here?—Never, not an instance of it.

21,943. (*Chairman*). Do you know a man of the name of John Evans Roos; is there any patient of yours of this name?—I know a young man of the name of Roos, he is living at Goginau.

21,944. Is he at all affected in his breathing?—I do not know, he is only living there; I have never been called to him.

21,945. Do you know another man of the name of William Ishmael?—No; I believe that there is a man of that name living here about.

21,946. Do you know a man of the name of Evans?—No.

21,947. Persons of those names have not been under your care?—Never. The mines in our neighbourhood are very well ventilated.

21,948. (*Sir P. Grey Egerton*). How are the dwellings of the poorer classes in your neighbourhood?—Very poor. I was going to suggest whether we could not get them to clean their houses better; I tell them that it is very unwholesome that they should keep their houses in the way they do. All that I can get from them is, "That is the way I have seen my father do; my father lived to old age, and I do not see why I should make any difference."

21,949. But they are habitually cleanly in their habits?—Yes, very much so on the hills here.

21,950. Are the cottages small?—Very small.

21,951. How many rooms have they, generally speaking?—About a couple.

21,952. Are they properly ventilated?—No, they are very badly ventilated, and the cesspool is close to the house, as are also dungheaps.

DEVIL'S BRIDGE, CARDIGANSHIRE.

Mr. E. Rowland.

24 July 1863.

21,953. Do you find that the families of the miners suffer much constitutionally from these habits of dirt?—I find them in a great measure causing fever in the houses. The miner is better off than the family. During the last six years that I have been living here there has been a constant fever, typhus and typhoid and scarlet fever, upon the hills from Goginau up to Stelvagerrig.

21,954. You attribute that in a great degree to the uncleanly habits of the people?—Yes, and the dampness of the cottages.

21,955. And their contracted dimensions?—Yes.

21,956. From your general knowledge of mankind, do you think that if they had better houses they would take a pride in them and be induced to keep them more cleanly, or do you think that it is an inveterate habit of untidiness?—As a general rule it is what they have been used to, but some are building new houses now, and they keep them clean when they get new houses. If there was a possibility of it I should like to get an Inspector, or some law.

21,957. (*Chairman.*) There is a sanitary provision?—We cannot get it put into force here. I have tried all that I possibly could with the Board of Guardians.

21,958. (*Mr. Holland*). Do miners at 50 look older than other men at 50?—They will look more pale and sallow.

21,959. Do they look decidedly older or not?—I am sure I do not know.

21,960. You have not noticed that?—No, I have never noticed that.

The witness withdrew.

Adjourned to To-morrow at Aberystwith.

ABERYSTWITH.

Saturday, 25th July 1863.

PRESENT:

The Right Hon. Lord KINNAIRD, K.T.	NICHOLAS KENDALL, Esq., M.P.
Sir P. GREY EGERTON, Bart., M.P.	P. H. HOLLAND, Esq.

The Right Hon. Lord KINNAIRD, K.T., in the Chair.

Mr. JOHN GRAHAM WILLIAMS, of Gloucester Hall, near Aberystwith, examined.

21,960. (*Chairman.*) I believe that you are agent for some properties in this neighbourhood?—I am agent for the Gogerddan estate, belonging to Mr. Pryse Loveden.

ABERYSTWITH.

Mr. J. G. Williams.

25 July 1863.

21,961. Are you acquainted with the circumstances of the miners residing in that neighbourhood?—I am, generally.

21,962. I believe there was a petition presented to Parliament this year from that district?—There was. There were several petitions.

21,963. They were from miners complaining of the non-payment of the sums earned by them in working in the smaller mines?—The complaint, I believe, was of the great difficulty in obtaining their wages.

21,964. I believe you also wrote to Lord Palmerston and to the Home Office?—I did. Last year I wrote to Sir George Grey; last June, I think it was.

21,965. Does that state of things exist generally throughout the mines, or are there exceptions?—There are exceptions.

21,966. What are the exceptions?—The exceptional mines are all those worked by the Messrs. Taylor; they are most regular and punctual to the hour, and as far as I have ever heard, they have never missed one payment since they commenced working the mines in this part of Cardiganshire.

21,967. Then I suppose it is the smaller companies whose payments are so irregular?—It is the smaller companies.

21,968. Where this has happened, have the mines been worked for some time, or are they very recent?—They are very ancient mines.

21,969. And they have been working?—Continually working, the lessees changing occasionally.

21,970. Has the system of non-payment or irregular payment been a general practice, or is it a new thing which has arisen lately?—I believe that it has increased considerably within the last 10 years.

21, 971. I believe you can bring witnesses before us from amongst the men who can speak to that point?—I can.

21,972. Have any means been taken to recover the wages by the men?—Yes, there have.

21,973. Have they succeeded?—In some instances, and in many instances at a loss; in fact, the opposition on the part of the directors has been very great, they throwing themselves into bankruptcy, and saying, "We are too poor."

21,974. (*Mr. Holland.*) The opposition would be on the part of other creditors, would it not?—Yes, as well as the directors throwing themselves into the Court of Bankruptcy.

21,975. (*Chairman.*) Is there any particular case where you know that large sums have been due to the

ABERYSTWITH.

Mr. J. G. Williams.

25 July 1863.

men and yet they have not been able to recover them?—Yes, particularly in respect to a mine called the Darren mine. It is one of the oldest mines which we have in this country. It was worked by Sir Hugh Myddleton and Sir Humphrey Mackworth. This is a list which was furnished to me by Mr. Hugh Hughes, the Solicitor of Aberystwith, in whose hands these poor people have placed themselves, to try to recover their money. Some of these men I can produce before you.

21,976. What is the total amount due?—According to the list now in my hands, it amounts to 508*l.*

(*The Witness delivered in the following Paper.*)

BALANCE of WAGES due to the Miners of the "Great Darren Mine," July 1862.

	£	s.	d.

	508	3	1

21,977. These men have no means of recovering in the county court?—The expenses incurred in the county court are so heavy that it deters them from taking proceedings.

21,978. Are you aware whether these men are induced to work nothwithstanding the uncertainty of payment, by the offer of higher wages?—That I cannot say, further than at the expiration of the month they ought to be paid, but no money comes down. The agent says, "Carry on for another week or fortnight; the money is sure to come down."

21,979. And so they are induced to work on?—Yes; and perhaps instead of 100*l.* or 150*l.* coming down, they will send 20*l.* and it must be be distributed in shillings amongst the men to keep them quiet.

21,980. (*Mr. Holland.*) To keep them alive?—Just to keep them alive.

21,981. (*Chairman.*) Can you state anything with regard to the cottages in this district?—I know most of them.

21,982. Do you think that they are convenient and conducive to health?—I cannot say that they are.

21,983. Do the cottages generally belong to the miners or to the proprietors?—In some of the mines which are up in the mountain, there are what are called barracks erected for perhaps 100 men; they come up on Monday morning and leave on Saturday evening. Those barracks are very healthy. Then at other mines the proprietors have erected a row of cottages. Those are kept in very nice order; but it is the cottages down in the lowlands, if I may use the expression, which are in a bad state.

21,984. Do those in the lowlands belong to proprietors, or are they built by the miners?—They are mostly leaseholders.

21,985. Do the proprietors grant a long lease?—60 years.

21,986. (*Mr. Holland.*) Is the leaseholder a leaseholder of a large piece of property?—No; we grant we will say enough for a cottage and a garden.

21,987. The cottager himself is the leaseholder?—Yes. Mr. Loveden we will say is the lessee, and he grants a series of cottages and enough for a garden to each cottage.

21,988. (*Chairman.*) When they rent a cottage by the year, what rent do they pay?—It varies. Perhaps 12*s.* a year, but seldom above 20*s.* a year.

21,989. That is for the lease of the ground?—Yes.

21,990. What would be the cost of erecting one of the miners' cottages?—It would depend upon circumstances, from this cause—most of the miners' cottages are erected of mud, because we have no building stone in this country. We are very badly off for building stone, and very badly off for slates and lime. We have neither slates nor lime, nor good building stone in this part of the country at all, and therefore they are obliged to erect the cottages of mud.

21,991. (*Mr. Holland.*) Are they roofed?—They are roofed now. I do not now allow any mud cottages to be erected upon the Gogerddan estate; so that in selecting ground for the miners' cottages, I get them as near to the mine as I possibly can, in order that they may have stones taken up from the mines.

21,992. What is the annual value of the cottages in which they usually live?—Supposing the leaseholder was to let the cottage out to another party, it would be about 2*l.* 10*s.*

21,993. What remedy would you suggest for the evil which you have described as to the recovery of the wages?—I have had a great deal of conversation with several parties in this neighbourhood and one or two of our Attornies upon the subject, and the most effectual way which they can think of is this, that when a mine is wound up in the Court of Bankruptcy the first call should be to pay off the wages of the working miner.

21,994. The wages in full before any other claims?—Yes, inasmuch as the other claims are generally put in by the wealthy merchants who supply we will say timber, &c. They get great profits upon the articles which they supply, particularly if it is a doubtful mine, because they charge so much more; they can afford to wait a little longer than the poor working miners, who depend entirely upon their daily labour for their wages.

21,995. Would you also propose that they should have the power of the recovery of their debts before a magistrate before winding up, as domestic servants have?—If the law would enable them to do so, it would be a beneficial thing.

21,996. Domestic servants have that power up to 5*l.*, would you propose that also?—If the law could be so altered it would be very beneficial to them, because now it is not the directors of these small mines who are working the mines, it is the small shopkeepers in the country, of whom I can bring before you one or two, who have been ruined. They have suffered to such an extent that instead of being shopkeepers they are now working miners themselves.

21,997. Are there many of these sufferers on the parish?—There are a great many.

21,998. To such an extent as to be a real burthen to the parish?—We feel it very much. We have seldom a meeting of the Board of Guardians without some poor miner or his family coming for relief.

21,999. (*Sir P. Grey Egerton.*) The case which you have brought before us is a case of bankruptcy?—Yes, of winding up in the Court of Bankruptcy.

22,000. Can you give us any instances of solvent mines where the wages are in arrear to such an extent that the men have complained?—Yes; the mines worked by Mr. Murchison, what are called Nanteos and Penrhiw.

22,001. To what extent of arrears do they run there; I do not mean in money merely, but in time?—Three or four months.

22,002. In the cases of solvent mines have not the miners a remedy by going before a magistrate for the recovery of their wages?—If they have, we are not aware of it in this neighbourhood; it has never been tried.

22,003. (*Mr. Kendall.*) Are you aware that so far as the recovery of wages goes, there is a distinction between miners who work on tribute and tut work and those who work by the day?—No difference has been made in this neighbourhood which has come under my knowledge.

22,004. You are not aware that if a miner has daily wages he can recover before magistrates in Petty Sessions as far as 5*l.*; but that if he works on bargain work he cannot recover?—I am not aware of that.

22,005. (*Chairman.*) Do you consider that there is any difference in the health of the miners and of the farm labourers?—Many of the miners are labouring under sickness.

22,006. Of what form?—Generally consumption.

22,007. Disease of the chest?—Disease of the chest.

22,008. (*Mr. Holland.*) Is there any marked difference between the lodging of the two classes of men—the cottages which they inhabit?—In Goginan which is quite a new town, when the Goginan mines are in full operation, there are as many as six men living in one house.

22,009. That is a common lodging house?—Yes.

The witness withdrew.

Note added by the witness.—If a rider is allowed to be added to the above, I beg respectfully to inform you that the poor miners at the Great Darren mine have not received one shilling of their wages to this day.—14th October 1863.

[*For Questions Nos.* 22,019 *to* 22,082 *see Appendix A.* (8*vo.*) *p.* 21.]

GOGINAN, NEAR ABERYSTWITH.

Mr. William Henry Paull of Goginau mine, examined.

22,083. (*Chairman.*) What is the produce of the Goginau mine?—Silver lead.

22,084. How many men have you working underground?—About 50.

22,085. Are you driving or sinking?—We are driving the 100 fathom level, and we are sinking from the 60 to the 80, to get a communication, and we are putting up a rise against this part (*pointing to the plan*).

22,086. How far is the breast of the 100 fathoms level which you are now driving, from the nearest shaft orwinze?—About 160 fathoms.

22,087. Have you any artificial means of ventilation?—Yes.

22,088. What?—What we term a duck machine, worked by a wheel.

22,089. How is the air taken?—In iron pipes.

22,090. How many men are working?—Six men.

22,091. Do they work eight hours shifts?—Yes. We are rising from the 80 fathoms level, and we are sinking from below the 70 fathoms level.

22,092. Have you any artificial means of ventilation there?—No, not at present.

22,093. How long shall you be before you get a communication?—We are just upon the point of holing.

22,094. (*Mr. Kendall.*) How is the air there now?—It is very good in the winze but not very good in the rise.

22,095. (*Sir P. Grey Egerton.*) How do the men get there?—They come down an inclined plane; then walk into the 60 fathoms level, and then go down this shaft.

22,096. (*Chairman.*) How long is the powder smoke getting away from that end (*pointing to the plan*)?—Not long.

22,097. About how long?—A quarter of an hour.

22,098. Do the men prefer coming down the incline to climbing?—Yes.

22,099. About what distance have they to walk underground from the end of the incline?—About three quarters of a mile.

22,100. (*Mr. Holland.*) And how much would the climbing be?—It is 120 fathoms.

22,101. They prefer walking three quarters of a mile underground to climbing 120 fathoms?—They do.

22,102. (*Sir P. Grey Egerton.*) What is the height of the levels?—They are 8 feet high and 5 feet wide.

22,103. (*Mr. Kendall.*) Do the men adopt that course to avoid climbing or to bring them nearer to their homes?—To bring them nearer to their homes.

22,104. Supposing their homes were equally near from the surface as at the commencement of the incline, which would they rather do?—They would rather go up the shaft. One of the men went down there a little while ago when he was working there; he was nearer the top.

22,105. (*Chairman.*) What allowance of candles have the men per week?—2 lbs. a man.

22,106. What are they charged forthem?—8*d.* a lb.

22,107. And the same for powder?—Yes.

22,108. (*Mr. Kendall.*) Have you any men who are working from the 80 fathoms level up to the 70?—No.

22,109. Have you been underground much yourself?—Yes.

22,110. Lately?—Yes, almost every day.

22,111. You are now sinking a winze from the 70 fathoms level and rising from the 80 fathoms level, in order to make a communication?—Yes.

22,112. Is that the worst air in the mine at the present moment?—Yes, I think it is.

22,113. How many men work in the rise?—Two.

22,114. In the 24 hours?—Yes.

22,115. It is very desirable that you should have a communication?—Yes.

22,116. If that be the case why do you only work two men?—On account of the air being too bad for them to work more.

22,117. How many hours do those men work?—Eight hours.

22,118. Have you seen them when they have come up?—Yes.

22,119. Have you seen them whilst they have been there?—Yes.

22,120. Are they exhausted much while they are there?—No.

22,121. Do they complain?—No.

22,122. How does the candle burn there?—Pretty well.

22,123. Does it burn uprightly or are you obliged to put it on an inclination?—It burns upright.

22,124. (*Sir P. Grey Egerton.*) How many men are working in the winze?—Six.

ABERYSTWITH.

Mr. W. H. Paull.

25 July 1863.

22,125. (*Mr. Kendall.*) Will it be holed in a few days ?—Yes, we expect so. This point was holed in a few days where there is now good ventilation.

22,126. That end is the worst end ; have you any any other end ?—We have only this end and the 100 fathoms level driving.

22,127. Then you are 160 fathoms from a shaft or winze at the 100 fathoms' level, and you use a duck machine to throw in air ?—Yes.

22,128. What pipe have you ?—A 6-inch iron pipe.

22,129. How many men are there working in that end ?—Six.

22,130. Eight hours each ?—Yes.

22,131. Do they complain of the air at all ?—They do complain sometimes.

22,132. Is not the duck machine powerful enough to throw in air ?—Yes, there is good air there.

22,133. Then why do they complain ?—I do not know ; they do complain a little sometimes.

22,134. Have you been in there yourself frequently ?—Yes.

22,135. Is the air dead there ?—No.

22,136. How far is the pipe in from the end ; how close up is it ?—Within about a couple of fathoms.

28,137. There is no leakage to the pipe at all ?—No.

22,138. What size is your duck machine ?—Five feet wide and eight feet long.

22,139. You have gone 160 fathoms in, and the men complain at times ; how much further in do you intend to go before yon communicate with the 80 fathoms level ?—I cannot say that.

22,140. Are you extending your 80 fathoms level ?—We are extending the 80 fathoms level west, but not at present ; not till we get this communication.

22,141. The moment you communicate you will do so ?—Yes.

22,142. If I understand you rightly, you will be driving your 100 fathoms level east, and you will be driving your 80 fathoms level west till you can communicate ?—Yes.

22,143. In driving west on your 80 fathoms level, is there anyore ?—A little.

22,144. Driving east is there any ore ?—There are spots.

22,145. Am I to understand that at whichever end it will pay best for driving, that end you will drive on ?—Yes.

22,146. I see that your 70 fathoms level is suspended ?—Yes.

22,147. Why ; is it because there is no ore ?—Yes.

22,148. Your 80 fathoms level is suspended going east ?—Yes.

22,149. Is that because there is no ore ?—Yes.

22,150. How does your ore dip ?—It dips westward a little.

22,151. You have suspended your 140 fathoms level ?—Yes.

22,152. You have suspended your 130 fathoms level west ?—Yes.

22,153. (*Sir P. Grey Egerton.*) Is it a wet mine or a dry mine ?—It is not particularly wet.

22,154. How do you get rid of your water ?—By pumping.

22,155. Not by an adit level ?—It is drawn up to the adit level.

22,156. Where does your water accumulate ?—In both shafts, from the 140 up to the 120, and then it goes back to the next shaft.

The witness withdrew.

Mr. JAMES GARLAND, of East Darren Mine, examined.

Mr. J. Garland.

22,157. (*Chairman.*) What is the name of the mine of which you have charge ?—East Darren.

22,158. How many men are working under ground ?—We have at this time 74.

22,159. Are any of those boys ?—They are all men ; about 18 is the age of the youngest. I am prepared with a list of them.

22,160. How many tutwork men and how many tributers have you ?—We have somewhere about 60 tutwork men.

22,161. Are you sinking or driving ?—We are now principally driving and sinking winzes ; at the 116 fathoms we are driving.

22,162. How many men are working there ?—Six men are driving east from the 116 fathoms.

22,163. Do they work eight hours shifts ?—Yes.

22,164. (*Mr. Kendall.*) Is it on the course of the lode ?—Yes.

22,165. (*Chairman.*) Where is the next place ?—The next is driving 104 fathoms west.

22,166. Have you any artificial means of ventilation there ?—Nothing but the winze.

22,167. How far is it from the winze ?—40 fathoms.

22,168. Do you think that the air is close there ?—Not very close ; four men are working there ; we give one third of the time.

22,169. When the air is close you generally diminish the number of men working ; you leave a longer time ?—We leave a longer time between.

22,170. What is the next point ?—The next point is a stope at the back. We have four men at that stope.

22,171. What is the next point ?—At the 92 fathoms.

22,172. Are you driving or sinking there ?—We are sinking there with six men.

22,173. (*Mr. Kendall.*) How far off a winze are you ?—From 30 to 35 fathoms. We are only 2 fathoms from a winze at the 92 fathoms east, and the winze is only 2 fathoms deep.

22,174. (*Chairman.*) What is the next place ?—A level driving east, somewhere about 7 fathoms east of the winze.

22,175. What is the furthest point where you are driving from any winze ?—At the 68 fathoms going west ; there are two men working there ; they are driving a cross-cut.

22,176. Is there not a good deal of moisture in your mine ?—Yes, in places.

22,177. Do you consider that the small streams and drippings of water assist ventilation ?—Yes, greatly.

22,178. You are aware that a petition was presented from this quarter from men who had not been paid their wages ?—Yes.

22,179. Do you know that to be the case ?—Yes. I have a list (*producing the same*). Those are the names and here are the bills and everything to correspond.

22,180. The list which you give in contains the names of men who are owed money, and the names of the mines are also given ?—Yes.

The witness delivered in the following paper.

Court Grange Mines' Pay for May 1855.

	£	s.	d.
To Evan Evans, for stoping, &c. - -	2	10	8
To Evan Evans, ditto, for June month -	6	17	6
Llely Evanhen Mine.			
To David Morfans, for 4 months' labour	13	7	0
Abernant Mines Company.			
To Richard Pearce - - -	2	17	6
Great Darren Mine.			
To John Vincent, for 5 months' labour -	15	3	8
To Thomas Roderick, for 84 days' work -	7	15	2
To John Morgans, for 2 month's labour -	6	7	2
To Ann Thomas, for labour -	1	12	3
To Thomas Allen, for 2 months' labour -	2	2	11½
Blaen Ceilan Mine.			
To Isaac Jones Smith, 1 month - -	1	10	3
To Richard Jones - - -	4	7	10
To Edward Jones, 1 month - -	2	15	7½
Willow Bank Mine.			
To John Mason - - - -	0	10	0
To Edward Edwards - - - -	0	10	0
To Evan Evans, for 7 days' work at 2*s.* -	0	14	0
To Richard Davis and pair, January 1859, for driving - - - -	28	0	0
	£97	1	7

22,181. Do you know any mine where on the last pay day there was no pay ?—There was a mine, but it has paid since your lordship was here ; it was a fortnight after the time ; 97*l.* 1*s.* 7*d.* is the amount of money owing at the mines in the list which I have handed in.

22,182. These mines are still being worked ?—They are now working, but the pay has not been regular.

22,183. You have heard complaints from men on that subject ?—Yes, since 1855.

The witness withdrew.

Capt. John Williams, of Cwm Erfin Mine, Goginan, examined.

22,184. (*Chairman.*) What is the produce of the Cwm Erfin Mine ?—Silver lead.

22,185. What number of men are working under ground ?—We have 100 men underground ; there are 110 men including trammers ; we have 98 pick men, what we term miners.

22,186. Are they principally on tut-work or tribute ?—Principally on tut-work.

22,187. What is the lowest level at which you are now working ?—The 32 fathoms under the adit.

22,188. What is the lowest level in the mine ?—69 fathoms.

22,189. Is there water there ?—No, it is clear of water. This part of the mine, the 69 fathoms, has been tried, but it is poor.

22,190. How far is the breast of any end from the nearest winze or shaft ?—It is 22 fathoms, from where the rise is, going up.

22,191. How do you consider that the air is there ?—Very good The smoke lies a little.

22,192. How long is the smoke getting away ?—20 minutes. This (*pointing to the plan*) is 7 fathoms from the present end ; and this (*pointing to another part*) is 23 or 24 fathoms to this stope which is now being put up.

22,193. (*Mr. Kendall.*) On the 20-fathoms level, where you are sinking a winze, you are 22 or 23 fathoms from a rise ?—Yes ; but in eight weeks this will be communicated. [The rise and winze have since been communicated.]

22,194. Is that the worst part of your mine ?—That is the only place where any smoke lies.

22,195. Every other part of the mine is well ventilated except that part ?—Yes ; the smoke lies here about a quarter of an hour or 20 minutes, and no more. That is in the 20-fathoms level and the 32-fathoms, sinking from the 20-fathoms and rising from the 32.

22,196. You think that a communication in eight weeks will remedy all that ?—Yes, I am quite positive of it.

22,197. How many men work in the 32 fathoms rise ?—Four.

22,198. And how many men in the winze at the bottom of the 20 fathoms ?—Four.

22,199. (*Chairman.*) That leaves eight hours rest at night ?—Yes ; there is no one working in either of those places at night.

22,200. Why is that ?—If they worked by night in all probability it might cause smoke ; it would not be so clear in the morning.

22, 201. (*Mr. Kendall.*) It is in order to collect a little good air ?—Yes. That is the only place where we have any smoke.

22,202. You are working in slate ?—We are working on the course of the lode.

22,203. The country is slate ?—Yes, quite a clay slate.

The witness withdrew.

Adjourned to Monday next, at Snailbeach Mine, near Shrewsbury.

SNAILBEACH MINE, SHROPSHIRE.

Monday, 27th July 1863.

PRESENT :

The Right Hon. Lord Kinnaird. K.T.	Nicholas Kendall, Esq., M.P.
Sir P. Grey Egerton, Bart, M.P.	P. H. Holland, Esq,

The Right Hon. Lord KINNAIRD, K.T., in the Chair.

Mr. William Eddowes, of Pontesbury, near Shrewsbury, examined.

22,204. (*Chairman.*) Have you practised long as a surgeon in this district ?—Since 1835.

22,205. Do you attend the miners at any of the mines in this district ?—I attend the Snailbeach mine.

22,206. What arrangement is made with you as to payment ?—They pay me so much a man.

22,207. Is the appointment made by the company ?—Yes ; it was, with the consent of the men at the time ; the men had their own choice.

22,208. What is the amount which is paid by each man ?—It was 8*s.* a year formerly, but now it is 12*s.*, including the family. The distance from here to the mine is about four miles ; some of the miners live seven miles away from here ; some families live at that distance and I attend them. The men without families pay just the same ; boys pay rather less, but I do not know what it is now.

22,209. Have you any cases under your notice where the men were affected differently from other labourers ?—Not the miners, but the smelters.

22,210. Then you do not come across cases where the men are at all affected with pulmonary disease ?—I see scarcely any more than in common labourers, I think. I do not see that there is any difference.

22,211. Is the district healthy ?—Yes.

22,212. Are there any cases of phthisis ?—Just the same ; I do not see any difference.

22,213. Are the smelting works in the neighbourhood ?—The smelting works have been removed within the last 12 months from Pontesford to the mines ; since then there has been a good deal of illness amongst the men.

22,214. Amongst those employed in the smelting ?—Yes, lead colic.

22,215. These works are at the mine ?—They are, or at least within half a mile ; a tramway runs from the mine down to them.

22,216. And the men working there are affected ?—They are affected with lead colic. They used to be so at the smelting house at Pontesford occasionally. Since I came to Pontesbury there was one mine which was then the Gravels, and Grit, but which is now called the Roman Gravels. That company failed some years ago, that would be about 24 or 25 years ago. A good many of the men at that mine were affected with lead colic, and that is scarcely ever the case here.

22,217. (*Mr. Kendall.*) You mean at the mine itself and not at the smelting works ?—Just so.

22,218. (*Mr. Holland.*) Were they near the smelting works ?—No, they were eight miles from the smelting works, in fact there was no connexion with them at all ; a good number of them had it at one particular time.

22,219. (*Chairman.*) Is that the case at present ?—It is not that ; that was at the White Grit mine, they were all one mine then but now they are two

Snailbeach Mine, Shropshire.

Mr. W. Eddowes.

27 July 1863.

mines. No doubt it was owing to the work being dusty; it is very loose, and there was a good deal of carbonate of lead found at that time in the mine. They either inhaled it or they took it in from their fingers when eating, as they often take something to eat in the mines, and of course they have no means of washing themselves, or if they do wash themselves it is of course in water impregnated with lead.

22,220. (*Mr. Holland.*) They took it with their food?—No doubt of it, or they may have inhaled a little.

22,221. Has that ceased now?—Yes. I have not known anything of the kind for more than 20 years.

22,222. (*Chairman.*) Do you attend any men from those mines?—I did until latterly; I have given them up.

22,223. (*Mr. Holland.*) Can you explain the cessation of that disease?—I do not recollect now, it is so long ago. I did not attend the miners then, but I was called in in a number of cases. I know that it ceased about 20 years ago.

22,224. Are they still working in carbonate of lead?—They are still working in the same mine, but I do not think that they find carbonate of lead now.

22,225. You said that there was no particular excess of lung disease among the miners?—No.

22,226. Do they live as long as other men?—Yes.

22,227. Are many of them above 50?—Lots of them are 60 and 70.

22,228. Are the men above 50 in fair health?—Yes; there is one man now who has become infirm within the last few months, who has worked on the mine between 50 and 60 years.

22,229. Do they look as young as other men of 50?—I do not see any difference in them, excepting perhaps in a few; but they all look very well.

22,230. Are they ruddy as other men?—Yes, I see little difference.

22,231. Would you know a miner from an agricultural labourer if he had his Sunday clothes on?—They are rather smarter fellows.

22,232. (*Mr. Kendall.*) You would not know him by the colour of his skin?—Not at all.

22,233. (*Mr. Holland.*) Do you know any other lead mines but these?—I know all in this neighbourhood.

22,234. Do you know any in Flintshire?—No, except by name.

22,235. (*Mr. Kendall.*) Have you been underground?—Yes.

22,236. (*Mr. Holland.*) In what respect do these mines differ from other lead mines?—I think the difference is that they are in rock. This mine is in a solid rock, and the ore being large if you go down it is like going into this room.

22,237. They are very large excavations in solid rock?—Yes.

22,238. Have you been frequently down the mine?—Only once.

22,239. Did you get well through it?—Yes, very well.

22,240. What is the usual size of the excavation?—It is so long ago that I forget—it varies very much—it is upwards of 20 years ago.

22,241. (*Sir P. Grey Egerton.*) In the course of your practice have you ever seen a case of true miners' asthma?—No, I do not recollect that I ever have.

22,242. Are you acquainted with that disease by reading?—You mean such as cutlers get from very fine particles?

22,243. It is a bronchial affection passing on to the lungs and ending generally in death after a few years.—We get none of it here.

22,244. Are you acquainted with it elsewhere?—No, only so far as seeing an account of asthma, and the different causes.

22,245. Are you acquainted with the symptoms of true miners' asthma by reading or by practice?—Do you mean in miners working in lead mines or copper mines, or tin mines, or what mines?

22,246. All mines. There is a peculiar disease to which all miners are subject, whether it is in lead or copper, or zinc or coal?—I have seen it in coal, and where the expectoration is perfectly blue.

22,247. Then you are acquainted with that particular disease which is called miners' asthma?—Yes; but I do not think that it is miners' asthma. I know that some writers call it so. I have seen two cases of that kind of asthma, but never in a miner; they were both colliers.

22,248. Are you sufficiently acquainted with the disease called miners' asthma to state positively that you never attended a case of it in the miners employed in the Snailbeach mine?—Yes; and I have attended perhaps as many as 500 miners in a year; but I have seen it in the colliers here.

The witness withdrew.

Mines Commission.

Asthma.

My Lord,

The only cases of asthma in any way connected with the Snailbeach mine, that I have attended since my examination on 27th July 1863, are the following:

James Chalenor, aged 34 years, a bricklayer; he never works underground.

John Jones, aged 50 years; he is the carpenter on the mine.

Ann Cadwallader, housekeeper to Richard Edwards, a miner.

And a boy, aged 10 years, who attends the national school, son of Samuel Evans, a miner.

I have, &c.,

The Right Honorable Lord Kinnaird, K.T.

Wm. Eddowes, Pontesbury, Salop.

Mr. John Hughes, of Worthen, near Minsterley, Salop, examined.

Mr. J. Hughes.

22,249. (*Chairman.*) Have you practised long in this district as a medical man?—No, I have only removed from Bishop's Castle here within the last two months. When I was living in Bishop's Castle I was surgeon to the Gravels mine; but I found it was so far to go, that I came nearer.

22,250. You have had the charge of the Gravels mine?—Yes, for about the last year and a half.

22,251. Do you find that there is any difference in the general health of men working as miners from that of other labourers?—I certainly get more cases than I have done in another appointment which I held as medical officer to a parish; but I have never had one serious case since I have attended the mine.

22,252. What are the sort of cases; are they pulmonary?—Generally speaking they are connected with pulmonary disease. I have had a good many cases of dyspepsia. The men say that the air is not very pure, and they have a good deal of pain after eating, and that sort of thing. I give them a little medicine and they get right; but I never had any serious case of illness consequent upon having worked in a mine.

22,253. But you think that the men are somewhat affected by the work?—Yes. If I had a lot of miners to examine for a life assurance society, and a lot of agricultural labourers; my opinion is that the majority of the agricultural labourers would be better lives than the miners.

22,254. What number of years should you say?—I should not like to say much more than 50 or 55 years for a miner.

22,255. (*Mr. Holland.*) About five years difference?—Yes, I should think so.

22,256. (*Chairman.*) You have had no cases which have not yielded to treatment?—No, I have never had one.

22,257. Are the cottages where the miners reside good?—No, not at all; generally speaking they are anything but healthy; they are mostly mud huts.

22,258. Are the families affected?—No, not particularly so.

22,259. (*Mr. Holland.*) I think that you are surgeon of the Grit mine ?—Yes.

22,260. Is that mine so called because it is working in a gritty stone ?—I do not know.

22,261. Is it a peculiarly gritty mine ?—Yes, it is a loose soil.

22,262. Do the men complain much of the dust of it ?—I never heard them complain. I have only been appointed to that mine two months, and I do not think that I have had more than two cases of illness.

22,263. Do you see anything of the miners who are not ill ; is it a part of your duty to do so ?—No.

22,264. You merely see them when they are actually ill ?—Merely when they are actually ill. I attend twice a week at the Gravels and the Grit mines; and anybody who wants to see me, can do so.

22,265. (*Chairman.*) How are you paid ?—I am paid per head, 8*d.* per month for each man ; and if the families are able to pay, I have 1*s.* a month and attend them, because they would come into my poor-law district if it were not for that.

22,266. (*Mr. Holland.*) For that you attend them whether they are hurt or ill ?—Yes.

22,267. Have you been accustomed to a mining population before this ?—Never.

22,268. Does it strike you that the mining population are decidedly weak in their lungs ?—Yes, I think so.

22,269. As compared with others ?—As compared with agricultural labourers.

22,270. Where have you practised before ?—I have been at Bishop's Castle for the last four years.

22,271. Where is that ?—About 10 miles from here.

22,272. Is it an agricultural district ?—Yes, quite so. While I was there I had charge of the Gravels mine.

22,273. Are the miners and the agricultural labourers lodged much alike ?—I think so.

22,274. Which are the best lodged ?—I think that they are much of a muchness.

22,275. Which do you think feed the best ?—I should say the miners decidly.

22,276. Do they feed as judiciously as the agricultural laboures ?—I think that they do.

22,277. Are they more fond of tasty food ?—You do not find the mining population eat salt meat so plentifully as the agriculturists do. All the farm labourers live upon bacon, salt meat, from the beginning of the year to the end ; and those diseases which we generally meet with amongst agricultural labourers, we do not meet with amongst miners. I think that they have more fresh food.

22,278. Do the miners eat fresh meat nearly every day ?—I think they do.

22,279. Do they live decidedly better than the agricultural population ?—A great deal better. My reason for saying so is, that the butcher who supplies me supplies most of the miners in this locality, and he has told me the quantity which they buy of him ; in fact he has a very good trade through them.

22,280. Do you consider the miners a steady class of men ?—Anything but steady.

22,281. Are they inclined to drunkenness ?—Yes ; generally on a pay day you will see the majority of them quite drunk before eight o'clock at night.

22,282. Is that once a month ?—Yes.

22,283. On other occasions are they steady ?—Yes, I think they are generally steady, but once a month they break out.

22,284. (*Chairman.*) At the Gravels mines do they pay the men in the vicinity of a public house ?—Yes, at the next house but one, and the men always go in to change.

22,285. Do they get notes ?—Sometimes, and gold.

22,286. (*Mr. Holland.*) Have you seen much of the disease which is called miners' asthma ?—No, I never had more than, I should think, five or six cases of it.

22,287. Have you formed a clear opinion of its nature ?—No ; I do not see any very great difference between it and cases of asthma which are met with independently of working in mines.

22,288. Do you think that it partakes more of the nature of bronchitis or of emphysema ?—Sometimes I have imagined it to be more emphysema than bronchitis.

22,289. Are the mines deep ?—The Gravels are not very deep.

22,290. Is the Grit mine deep ?—The Grit mine is nearly 300 yards, I think.

The witness withdrew.

Captain THOMAS HENWOOD, of Snailbeach Mine, examined.

22,291. (*Chairman.*) What is the description of ore raised in this mine ?—Lead.

22,292. Is there any silver ?—There is very little silver ; about two ounces in a ton, but I do not know exactly.

22,293. Have you charge of any other mine ?—No.

22,294. How many men have you working underground ?—203.

22,295. What is your lowest level ?—Our levels are numbered from the old shaft, and not from the adit, which is 112 yards from the surface ; the new shaft is 38 yards above the brace of the old shaft, so that the real depth of that shaft is 440 yards from the surface.

22,296. Do you always count in yards here ?—Yes.

22,297. What is your principal working now ; are you sinking or driving ?—We are stoping and driving.

22,298. What is the lowest level in which your men are working ?—402 yards at the old shaft ; that would be 440 yards from the brace of the new engine shaft.

22,299. How many men have you working there ?—12 ; 6 in the east end and 6 in the west.

22,300. How many hours shift do they work ?—Eight hours.

22,301. Have you any places where you have less than six men working in the ends ?—No, not in the ends.

22,302. In sinking or putting in a rise, have you any fewer number than six men ?—We have seldom less except in a tribute pitch.

22,303. Are the greater proportion of the men tribute or tut workmen ?—I should say tribute, but I am not prepared to speak exactly.

22,304. What allowance of candles do the men have ?—Two pounds a week each.

22,305. What is the charge ?—8*d.*

22,306. And the same for powder ?—Yes.

22,307. Do the men pay the doctor ?—Yes.

22,308. Is there a club for visible hurts ?—Yes.

22,309. Is there club money as well as the payment for the doctor ?—Yes.

22,310. There are two charges ?—Yes.

22,311. What is the amount of the club money ?—Club is 9*d.* and the doctor 1*s.* per month.

22,312. Does the doctor attend the families for that ?—Yes ; but not confinements, for which he charges extra.

22,313. Is your power steam power or water power ?—Steam power.

22,314. How many steam engines have you ?—One 60-inch cylinder pumping engine and four others.

22,315. Have you any water-gauge ?—They call them gauge-cocks. We have a glass water-gauge on one of our winding engine boilers.

22,316. How many engine boilers have you altogether ?—We have six on the mine, one to a new engine which we are putting up, and one at the lead works.

SNAILBEACH MINE, SHROPSHIRE.

Capt. T. Henwood.

27 July 1863.

22,317. On one of those you have a water-gauge? Yes, but on the others we have only the gauge taps.

22,318. Is the mine wet at all?—Not very, our engine only works six hours in the 24, on an average.

22,319. Do the men reside near the mine?—Not very many of them; the greater portion are scattered over the hills.

22,320. Do they change when they come to the surface?—Yes.

22,321. Where do they change?—In the cabins or barracks near the shaft.

22,322. Do they ever change in the boiler-house? No, that is strictly prohibited.

22,323. Are your smelting works near here?—Yes, about a quarter of a mile off.

22,324. Do the smelters reside in their own cottages near, or do they come from a distance?—They come from a distance, and have bed-rooms in the melting-house yard.

22,325. What are their hours of work?—Six to seven hours, I think.

22,326. How many shifts do they work?—I think they call six hours a shift; but that is out of my department.

22,327. (*Sir P. Grey Egerton.*) Have you a code of rules for the observance of the miners?—Yes.

22,328. Are they strictly enforced?—Yes.

22,329. How do you enforce them, by means of fines?—Fines. Each shift lost subjects a man to a fine of 2*s.* 6*d.*, and if absent from work three days in any one month he is liable to dismissal.

22,330. How is that money disposed of?—It goes to the sick-club.

22,331. How often do you pay the men?—Once a month.

22,332. Do you keep a month in hand?—About a fortnight in hand. We set generally for two months; we subsist them one month, and balance them off at the end of the second month.

22,333. Where do you pay the miners?—At the office, near the mine.

22,334. Is it near a public house?—No, it is half a mile from a public house.

22,335. Do you pay them in notes, or in gold and silver?—In gold and silver generally, to avoid the men going to the public house.

22,336. (*Mr. Kendall.*) Did you work in Cornwall before you came here?—Yes, I worked under Capt. Puckey from my boyhood up till I came here.

22,337. Did you ever work in the Fowey Consols?—Yes.

22,338. Did you ever work in the deep levels there? Yes, in the 220 fathoms level.

22,339. It was very warm there, was it not?—Yes, very hot. I used to work naked.

22,340. Did you suffer much there?—Never, except when I was aged about 17; I was working at the 210 before the circulation changed at Botterills, and I had a heart disease.

22,341. Do you think that that was from going up and down the ladders, or from cold?—From going up and down the ladders.

22,342. Have you quite recovered?—Yes.

22,343. Taking the miners in Cornwall and the miners in this district, which are the more healthy of the two?—They are more healthy here.

22,344. Do they work as hard here as they do in Cornwall?—Yes.

22,345. To what do you attribute the difference of health, both being deep mines?—I do not know further than that the mine here is cooler.

22,346. Is this mine better ventilated than the deep mine at the Fowey Consols?—Yes.

22,347. Do you think that the ventilation is more cared for here than it was there?—I do not know whether it is better cared for, but the runs of ore are more extensive, and consequently the ground is beaten away.

22,348. There is more room for air to circulate?—Yes.

22,349. There are larger shafts?—Yes, and larger levels here.

22,350. What is the average level here?—Our average size for the levels is 6 feet by 7 when we drive.

22,351. Seven feet high and 6 feet wide?—Yes.

22,352. Do you recollect, upon the whole, what was the average in the Fowey Consols?—About 4 feet 6, by 5 feet 6.

22,353. Therefore, on that head, you are better off here than you were at the Fowey Consols. I will now take another ground: Take the average size of the lodes in the Fowey Consols and here; what is the average range here above the Fowey Consols, when you get out of the simple driving, and get into the veins?—The vein in Fowey Consols seldom exceeded 12 feet in the widest places.

22,354. And it is was generally what? would it average 3½ feet?—About that I should say.

22,355. To what extent do you go here sometimes?—20 feet.

22,356. Will it average 9 feet here?—Yes, and above in the bearing parts.

22,357. Will it average 10 feet?—About that.

22,358. (*Mr. Holland.*) Have you any ends here where the candles will not burn freely?—No.

22,359. Have you any ends where the powder smoke hangs for an hour?—No.

22,360. What is the longest time that it hangs?—From twenty minutes to half an hour.

22,361. Are there many ends in the Fowey Consols, where the powder smoke hangs for an hour or more? Yes, more than two hours; it is seldom clear from one end of the week to the other.

22,362. What disease have the Cornish miners more than the miners here have?—They are generally attacked with disease of the heart and bronchitis in Cornwall.

22,363. Have they that here?—Seldom, I believe.

22,364. Do you know the disease which they call miners' asthma, in Cornwall?—Yes.

22,365. Is that a common disease here?—I do not know that it is.

22,366. Below what level are your main workings?—Our principal workings are below the 252 yards level.

22,367. Then the majority of your miners climb 100 fathoms?—Yes.

22,368. Your miners have very much more climbing than the Fowey Consols miners have?—Yes. They have a man-engine now at the Fowey Consols.

22,369. Had they a man-engine there in your time?—Yes, and there has been a man-engine spoken of here. The men climb faster in Cornwall than they do here.

22,370. Does climbing 100 fathoms hurt a healthy man if he climbs slowly enough?—It is very laborious work; I should think that it would hurt him more or less.

22,371. How much of his day's work does it take out of a miner to climb 100 fathoms; does it take out as much as one third; how long would it take him to go up and down 100 fathoms?—Perhaps 50 minutes.

22,372. How much ordinary work is that climbing equal to; is it equal to as much as three hours?—It is fully equal to one hour and a half.

22,373. What mode of signalling have you down the shaft?—We have a signal wire.

22,374. Have you any other method? A gutta percha pipe runs 38 yards from the surface to the landing level.

22,375. Is that gutta percha pipe a great convenience?—Very great.

22,376. Is it a serious expense? No, it is not expensive; the inch pipe is about 10*d.* a foot.

22,377. (*Chairman.*) What are the gettings of the men; what do you allow the tutwork men to get generally?—From 20*s.* to 22*s.* per week.

22,378. Is it the same with the tribute men?—Rather below; they are less able men on the whole.

22,379. Has the amount been raised within any short period ?—No.

22,380. Has it been always the same since you have been here ?—Yes.

22,381. Have you any women working at the surface ?—No.

22,382. Do you think it desirable not to have women working ?—I do.

22,383. In what respect ?—I think that their morals are taken care of more at home ; they become better wives.

22,384. Do any of the wives and daughters of the men work at agricultural labour ?—I do not know that they do ; they generally go to domestic service.

22,385. (*Mr. Kendall.*) Then you suppose that if they go into domestic service, they get to understand the management of household matters better, and that when miners marry then they are better and more careful wives than they would be if they were to work here and not to know anything about domestic arrangements ?—Yes, that is my meaning.

22,386. With respect to your wages, are they higher than at the mines generally in this district ?—Yes.

22,387. As far as you can learn, what is the average at the mines generally in this district ?—15*s.* per week.

22,388. For this extra pay do you require more at the hands of your men than is required in other mines ? do you require your men to work harder or more hours ?—Our men work harder and the mine is deeper.

22,389. Generally speaking you exact your eight hours ?—Yes, we call it an eight hours shift, but the men, on the average, do not spend 6½ hours in actual work.

22,390. You work longer here than they do in other mines ; when did that begin ; under Captain Eddy's management ?—Yes.

22,391. When you first came here ?—Yes.

22,392. Did the men like it at first ?—They did not like it at first.

22,393. Still you allowed them good wages ?—Yes.

22,394. Was there a strike ?—Yes.

22,395. How long did it last ?—A fortnight.

22,396. What did they complain of ?—They complained of the eight hours shift instead of six.

22,397. Did they say that it hurt their health ?—Yes.

22,398. What did the doctor say ?—He said that none of the men had applied to him for any medicine or drugs of any sort more than previously to the eight hours shift.

22,399. Did you go into a history of their wages at the time of the strike ?—Yes.

22,400. What did you find that their average was when they struck ?—The tributers would average 29*s.* 5*d.*, and the tutwork men 22*s.* 7*d.* per week.

22,401. When that was proved, had it the effect of quieting the men or not ?—Yes.

22,402. What induced them to go back to their work again, your being firm or what ?—It was owing to Mr. Eddy, the manager, being firm.

22,403. Have you had anything of the sort since ?—No, they have been very decent men since.

22,404. (*Chairman.*) What were their earnings before ?—I am unable to answer that question.

22,405. (*Mr. Kendall.*) Your pay-day is once a month ?—Yes.

22,406. On Friday ?—Yes.

22,407. What becomes of the Saturday ?—We always allow the men the Saturday to go to market to lay out their money to the best advantage.

22,408. They have a whole holiday once a month ? Yes.

22,409. Supposing a man has any particular business which he wishes to transact, or any family matters, that he wishes to stay at home to attend to, do you allow him to stay at home ?—Yes, provided he asks leave.

22,410. What has he to pay the man who takes his place, provided he is in a corps ?—3*s.* per shift.

22,411. How frequently do you permit that, once or twice in the year, or more ?—Occasionally.

22,412. According to the emergency, I suppose ?—Yes.

22,413. If they make out a good case you at once grant them this privilege ?—Yes, according to the case.

22,414. (*Chairman.*) You have stated that you have had few accidents by blasting, what precautions do you use ?—I do not know that we use any precautions more than in other mines.

22,415. Do you use cartridges ?—Yes.

22,416. Do you use the fuze or the straw ?—The straw.

22,417. Do you use a copper or an iron pricker ?—Iron.

22,418. What do you think accidents in blasting arise from ?—Through neglect, generally.

22,419. In what way ?—In charging the ramming, tamping the hole, drawing pricker, &c.

22,420. Not using proper tamping ?—Not using proper tamping.

22,421. What tamping do your men use ?—Principally lead ore and carbonate of lime of the bes quality.

22,422. Have they always that at hand when they are boring in the country ?—They would procure it if it was not at hand. Occasionally we use brick dust.

22,423. How many accidents have you had by blasting ?—None for at least eight years, and only two for at least 24 years.

22,424. How many other accidents have you had ?—I am not prepared to say, but I only know of two in the last eight years, and four in the 24 years.

22,425. (*Sir P. Grey Egerton.*) Were the fatal accidents of the last eight years from blasting ?—No, one was from a fall of a stone out of the shaft, and the other fell into a sump.

The witness withdrew.

SAMUEL JONES, of Snailbeach Mine, examined.

22,426. (*Mr. Holland.*) Are you a miner ?—Yes.

22,427. How long have you worked as a miner ?—I have worked for 22 years here and 4 years elsewhere.

22,428. Are you aware of any disease to which miners are more liable than other men in this district ?—No, not that I know of particularly.

22,429. Have you heard of a disease called miners' asthma in other districts ?—No.

22,430. Do you consider that miners are more liable to cough and similar diseases than other men ?—No, not more than other men that I know of particularly.

22,431. What depth are you working at ?—372 yards.

22,432. About how much time does it occupy you in going up and down ?—It occupies us an hour and a half.

22,433. That is about 60 minutes coming up and 30 minutes going down ?—Yes.

22,434. That is very hard work, of course ?—Yes, it is hard work to come up ; we can go down middling.

22,435. Does it take as much out of you as two hours' work in the mine ?—Yes, when we come up fast ; it is easier a good deal to work for a longer time than it is to climb for an hour.

22,436. Does it make you sweat very much ?—Yes, to climb up.

22,437. You are in a great sweat when you come up to the top ?—Yes.

22,438. About what distance is it from the top of

SNAILBEACH MINE, SHROPSHIRE.

S. Jones.

27 July 1863

the footway to the change house ?—About 15 yards.

22,439. Are you of opinion that the miners generally have better cottages than farm labourers ?—Yes ; about here.

22,440. What is the usual rent for a miner's cottage ?—Some get them at 4*l.* a year and some at 5*l.* ; some are better than others, and there are more rooms in them.

22,441. Do they ever go as high as 6*l.* ?—Yes.

22,442. How many rooms will such a cottage contain ?—Some contain two and some perhaps three.

22,443. And a pantry ?—Yes.

22,444. Do you mean two bedrooms ?—Yes.

22,445. And a living room ?—And a living room.

22,446. And sometimes three bed rooms and a living room ?—Yes, and sometimes a pantry and sometimes another place built by the side to keep milk, and to bake, and wash, and all that.

22,447. Is it customary for the miners to have gardens to their cottages ?—Yes.

22,448. Is it nearly universal ?—Yes, all round here.

22,449. About what size is the garden ?—Sometimes five or six roods.

22,450. What is your rood ?—We call eight yards square a rood.

22,451. Do any women work on the mines in this part of the country ?—Not upon this mine.

22,452. What class of women do miners generally marry ?—They do not all marry the same sort.

22,453. Have a large proportion of miners' wives been in service before they marry ?—Yes ; when they begin to grow up their family send them off to service.

22,454. Of course, such women must be better household managers than those who have worked in mines or factories ?—Yes, because they have seen more of it going on.

22,455. Do you think that miners live better than agricultural labourers ?—Yes.

22,456. Should you conceive them to be as a class a steady class of men ?—Yes.

22,457. Have they always a blow-out on pay day ?—No, very seldom ; some do. I got one last pay day. I got a good lot of drink then ; but it is only sometimes.

22,458. Is it a customary thing to have a little jollification on pay day ?—They most generally go and have a pint or two on that day.

22,459. Do they get a gallon or two ?—No.

22,460. Pay day is not a scene of riot ?—No.

(*Capt. Evans.*) We have not had a scene of riot for a great number of years.

22,461. (*To Jones.*) Is the mine dusty ?—No, not very dusty.

22,462. Is it damp ?—Yes.

22,463. There is sufficient [illegible] to keep down the dust ?—Yes.

22,464. Is there any annoyance from dust which annoys you ?—No.

22,465. Are you ever seriously annoyed by powder smoke ?—When we fire fi[illegible] in for a little bit, perhaps 10 minutes or s[illegible] go out, and the smoke goes off afterwards.

22,466. Do the miners keep out of the smoke until it has cleared [illegible] do they rush back to see what they have don[illegible] times they go in, but not to stay ; they go [illegible] out of it to wait till it is over.

22,467. Do not they all [illegible] soon as the shot is fired run in to see what is [illegible] No.

(*Capt. Evans.*) That is [illegible] failure among the men on this mine ; when [illegible] the holes they are anxious to see whether th[illegible] xploded well, and they go right into it.

(*Jones.*) After we hav[illegible] we stop till it has settled a bit, and then go [illegible]

(*Capt. Evans.*) If they [illegible] only to see just for a minute and then the[illegible]

(*Jones.*) We know very [illegible] it will do us an injury if we go in as soon [illegible] is fired.

22,468. Do miners here [illegible] their employment an unhealthy one ?—No. [illegible] think that they do. It is certainly more [illegible] than being on the top of the land working.

22,469. But you are not [illegible] it is particularly unhealthy ?—No.

22,470. Which work we [illegible] efer, underground or above ground ?—Unde[illegible]

22,471. Why ?—Becau[illegible] rk eight hours underground and twelve [illegible] e surface.

22,472. Do you get ab[illegible] ne earnings ?—We have it set undergrou[illegible] ometimes we get more than at other times. [illegible] lve hours on the surface we have an hour [illegible] llowed for breakfast and dinner.

22,473. You are not [illegible] ht hours at work underground, are you ; i[illegible] allowance out of that ?—Yes ; we have th[illegible] and down in the eight hours.

22,474. Do you not eat [illegible] w, too ?—Yes

22,475. What time do [illegible] upy ?—We take 20 minutes to half an hou[illegible]

22,476. Then in fact y[illegible] is 7½ hours underground and 10½ abovegr[illegible] underground, including eating time, &c., [illegible] bove ground.

22,477. And you hav[illegible] of making more money underground ?—Y[illegible] ve it set. Sometimes we get more and so[illegible] s ; it is according to how our bargain turns [illegible]

22,478. Are you not [illegible] to work harder aboveground than unde[illegible] — No, we work harder underground than [illegible] face.

The witness withdrew.

Mr. JOHN JOB, of Snailbeach Mine, examined.

Mr. J. Job.

22,479. (*Mr. Holland.*) What is your office ?—I am agent and accountant.

22,480. Do you consider the miners a steady class of men now ?—Yes.

22,481. Are they more steady than they were some years ago ?—Yes, from what I learn. I have only been here the last six years.

22,482. They are more steady now than they were reported to be some years ago ?—Yes.

22,483. To what do you attribute that change ?—Formerly the payment was partly by notes, and when we saw an evil created by paying the men in notes through their having to go to the public houses to get them cashed, we adopted the mode of payment by gold and silver. For the last three or four years we have not paid the men a single note that I am aware of.

22,484. Have you had any riotous behaviour on the pay day since you adopted that plan ?—Not that we are aware of amongst our own men, but we have found that some [illegible] liers have mixed themselves with our men [illegible] ed riots, which I believe our men have [illegible] at all willing to engage in.

22,485. (*To Captain J*[illegible] o you confirm that opinion ?—Yes. There [illegible] derful change in this country compared w[illegible] there used to be formerly.

22,486. Is there muc[illegible] in adopting that principle of paying every [illegible] l man in gold and silver ?—

(*Mr. Job.*) We do not [illegible] ry man separately; but every taker of a ba[illegible] we give him gold, silver, and copper, and th[illegible] es and settles with his partners in that barg[illegible] since having paid them in coin we find th[illegible] majority of our men settle with each other o[illegible] ones ins ead of going to the public houses as o[illegible] rly to get their notes cashed.

22,487. Are you alwa[illegible] to give them [illegible] ch

money as they can easily change among themselves ?—Yes, we endeavour to have it from the bank.

22,488. Is it a matter of much trouble to you to accomplish that ?—No, it is merely an arrangement at the bank.

22,489. Does it involve any expense to you ?—No.

22,490. It is no expense and but little trouble ?—Just so.

22,491. Are you aware of any reason why that plan should not be universally adopted ?—Not otherwise than that it may create a little objection on the part of the banking companies to offer gold and silver at the time of pay, because they prefer issuing their notes. But if an arrangement can be made there cannot be any difference.

22,492. The banks which issue local notes might object?—I cannot say that they would object, but they might prefer issuing their notes.

22,493. On the part of banks which do not issue notes there would be no reason to object at all ?—No.

22,494. Would it not give some trouble to the banks to provide the mines with such large quantities of small money ?—We have not heard of anything of the kind.

22,495. They make no objection to it ?—None whatever.

22,496. And they make no charge for doing it ?—No.

22,497. And you consider the practice of very great advantage to the working classes ?—Yes, and if it was universally adopted it would be better.

(*Captain Evans.*) This plan of paying in small money is one of the great reasons of the men's improved sobriety.

SNAILBEACH MINE, SHROPSHIRE.
Mr. J. Job.
27 July 1863.

The witness withdrew.

Adjourned to To-morrow at Shrewsbury.

SHREWSBURY.

Thursday, 28th July 1863.

PRESENT :

The Right. Hon. Lord KINNAIRD, K.T.	NICHOLAS KENDALL, Esq,, M.P.
Sir P. GREY EGERTON, Bart, M.P.	P. H. HOLLAND, Esq.

The Right Hon. Lord KINNAIRD, K.T., in the Chair.

The Commissioners met at Shrewsbury, and then adjourned to the Roman Gravels Mine.

Capt. RICHARD HENRY VIVIAN, of Roman Gravels Mine, near Minsterley, Salop, examined.

SHREWSBURY.
Capt. R. H. Vivian.
28 July 1863.

22,498. (*Chairman.*) What description of ore is raised in this mine ?—Potter's lead and blend ; we have a good deal of blend, commonly called black jack.

22,499. About how many men have you working underground ?—There are 84 underground-men.

22,500. Are there any boys among them ?—There are three boys underground, blowing a fan blast into a place where we want to communicate to another part of the mine ; we are obliged to blow a blast ; we are working for a communication, but we cannot work unless we have a fan blast to keep the men working.

22,501. In what level is that ?—Six fathoms.

22,502. What is your deepest level ?—60 fathoms below adit.

22,503. How many levels are you driving ?—We have six fore breasts driving.

22,504. Are you sinking ?—We are sinking a winze, but no shaft.

22,505. How many shafts have you ?—We have two shafts.

22,506. To the surface ?—Yes, from our day level, but not all the way continued ; but we have winzes sunk between the different levels ; we have two levels, but we call one the day level and the other the adit. The level does not take away the water ; the adit takes away all the water.

22,507. What is the depth of your adit level ?—20 fathoms.

22,508. Have you more than one fan machine at work ?—Only one, and that we want to keep only as short as possible ; we are doing that just in a case of emergency to hole places to ventilate properly.

22,509. And the proper ventilation would be by communicating ?—By a communication between the level and the winze.

22,510. Is either of the shafts an upcast and the other a downcast ?—Yes ; it is not always the same ; sometimes the draught goes down one shaft and up the other, as the wind changes it changes ; the draught sometimes goes in at the day level and sometimes it comes out ; it just depends upon the way that the wind is.

22,511. How long is the smoke hanging in any breast or level where you are working ?—In the worst place that we have got I should think that it might be somewhere about a quarter of an hour before it is thoroughly cleared out ; that is only the very worst place that we have.

22,512. How many men are working ?—Four men in a fore breast with the exception of one.

22,513. How many hours shift ?—It is called eight hours, but it is never more than $7\frac{1}{2}$ hours ; we allow them to come up at half past 1.

22,514. Do they change at the surface ?—Yes.

22,515. There are eight hours clear ?—Yes. When the men fire half an hour is allowed for the place to get cool a bit before the other men go in.

22,515. In 8 hours of the 24 there are no men working ?—Just so. That is the case with the exception of one fore-breast where we are wishing to push a little.

22,517. What allowance of candles have the men ?—We give a man 2 lbs. a week.

22,518. What is the charge to the men per lb. for candles ?—8*d.*

22,519. And how much for powder ?—8*d.*

22,520. Have you any accidents from blasting ?—We never have had one yet. We never had one accident in the mine.

22,521. Do you use cartridges ?—No, we do not require it ; the ground is dry ; we use the safety fuze.

22,522. What do you tamp with?—Generally with the softest material we can get—carbonate of lime or a skaley stuff—a sort of decomposed place in the vein.

22,523. Any thing that the men can find there ?—Yes, there is plenty of tamping material. Of course the miners do that for their own safety. We have never had a single accident since we began the mine,

SHREWSBURY.

Capt. R. H. Vivian.

28 July 1863.

with the exception of one on the surface, where a man fell.

22,524. Have you any women employed on the surface ?—Yes, we have four women.

22,525. What are the gettings of the men. What do you allow them ?—We allow them about 15*s.* a week.

22,526. Have you many tributers ?—We have about 33 tutwork men out of the 84 men. There are about 50 tributers.

22,527. Where are the men sinking ?—In the first north vein, from the 20 to the 40, to make a communication right over the fore-breast there.

22,528. Are the other men rising ?—No, that would be rather difficult. The air is very good, because the candles burn easily; but the smoke takes some time coming out. We are sinking to come down before it gets worse. Nine men are sinking there, and that will then be as good for air as it is here.

22,529. Where the fan is, it is not good air ?—Where the fan is is in the six fathoms level.

22,530. (*Mr. Holland.*) How long have you been here ?—I have been here four years the first of next month.

22,531. In what other districts have you mined?—Cumberland.

22,532. In what part ?—Smithergill Head, six miles from Alston Moor. My father and I were agents there.

22,533. Have you mined in any other district ?—Yes, in Northumberland, close to Hexham.

22,534. In any other?—Yes. I have been engaged in mines in Cumberland West, near Eskat. I was also agent in mining in Argyleshire, Scotland.

22,535. You have had opportunities of observing the miners in all those districts ?—Yes; and I have been a working miner nine years in Cardiganshire, South Wales.

22,536. Of course you have seen the disease commonly called miners' asthma ?—Yes.

22,537. Have you any of it here ?—No ; I do not think that we have a single case here.

22,538. Have you seen it in this immediate district ?—No, I think that we are as clear from it in this district as anywhere at all. I think that the mines are generally speaking more healthy here than in any other district, because they are not deep.

22,539. Have your miners any excess of disease of the lung over other labourers ?—No, I think not a single one.

22,540. And there has not been any excess of that disease, in your experience ?—No.

22,541. To what do you attribute their exemption from that disease ?—To the good ventilation of the mine ; nothing else. We have men here working who are between 70 and 80.

22,542. Have you as much climbing here as you have been used to in other districts ?—No, we have only 80 fathoms here altogether, and I have been used to climbing 190 fathoms.

22,543. Do you attribute the exemption from the disease partly to the less climbing ?—Yes, because the deeper the mines go the air gets more impure.

22,544. Do you think that that is the only cause, or is it the absence of climbing, too ?—I do not think that the effect of climbing has much to do with the constitution, because miners generally take their own time. It is the bad air that I think kills the miners, and brings on these diseases.

22,545. Does 190 fathoms climbing not hurt a healthy man ?—Certainly, to a certain extent, but I think nothing to equal the working in bad air and in places which are not properly ventilated ; it is the working that does the harm, and of course the climbing in the deep levels in Cornwall must be injurious as well ; but I would rather climb than ride at any time.

22,546. Why ?—Because there are so many accidents, and you cannot warrant a chain or any other machinery, because sometimes they are put up to test, and they may have been tried, and another party may have broken them.

22,547. (*Chairman.*) Have you ever been in a coal mine ?—No.

22,548. Are there no accidents from falling away from the ladders ?—Yes, there have been some, but nothing to compare with accidents from riding up and down the shafts.

22,549. How do you judge of that ?—We see so much of accidents in the papers in coal districts every week ; and in lead and copper and tin mines we seldom see of accidents of any men falling away.

22,550. Are the accidents put into the public prints, when men fall away from the ladders ?—Yes. I have had relations of mine who have fallen away, and it has been put into the papers.

22,551. Do you think that it is always put into the papers ?—I cannot be bound to say that.

22,552. Where were these relations of yours ?—In Cornwall, near Camborne. I am a native of Camborne.

22,553. (*Mr. Holland.*) Did you mine in Cornwall at all ?—No, I was not 10 years of age when I left Cornwall. My father has been agent there.

22,554. Have you any other objection to riding except the supposed danger of it ?—I have no objection to it excepting from the danger, but I have no objection to riding in certain sorts of ways. I do not object to the Cornish plan of riding with a man-engine. I do not consider that dangerous ; that is very good, but I mean riding in the skips, as they do in coal pits.

22,555. (*Chairman.*) Were you ever on a man-engine ?—No, I have only seen them.

22,556. (*Mr. Holland.*) Where you ever in a colliery cage ?—No.

22,557. (*Chairman.*) Have you a changing-house ?—No.

22,558, Where do the men change ?—Over the boiler.

The witness withdrew.

Mr. JOHN VIVIAN, of Roman Gravels mine, examined.

Mr. J. Vivian.

22,559. (*Mr. Holland.*) How many years have you been acquainted with mining ?—My father is agent, and I have been accustomed to it all my life. I am 28 years of age.

22,560. What mining districts do you know ?—Cardiganshire and Alston Moor, and Shropshire.

22,561. Are the miners of this district much more healthy than those of Cardiganshire ?—Perhaps they may be a little. I was rather young then, and I did not know much about them in Cardiganshire, but I know that the miners here are very much healthier than those in the north of England.

22,562. What is the great difference between the miners here and in the north of England ?—It consists in the system of mining, I should fancy, in driving the levels under the mountains.

22,563. The levels there are very much longer than they are here ?—Yes, some of them go a mile and a half in and there are very few shafts.

22,564. Those very long levels are ventilated artificially, are they not ? Yes, with blasts chiefly.

22,565. Is that an effective mode of ventilation ?—No, but it is obliged to be done sometimes ; for the sake of economy they put blasts into certain places at times.

22,566. You know the disease called miners' asthma, in the north of England ?—Yes, I have seen many cases of it. I have seen men at 40 and 43 years of age completely knocked up at Alston Moor.

22,567. Have you seen any cases of it here ?—I cannot say that I have seen exactly that kind of thing.

22,568. Do you consider the miners here free from

any particular affection of the lungs ?—Yes, I should fancy so.

22,569. They are not much more liable to it than other men ?—Not at all, I should say.

22,570. Do you consider that the miners at Alston Moor are better lodged and fed than the miner here ?—Yes, far better.

22,571. And yet, nothwithstanding that the miners here are much more healthy ?—Yes, on account of the different system of mining.

The witness withdrew.

Adjourned.

DOUGLAS.

29th February 1864.

PRESENT:

NICHOLAS KENDALL, Esq., M.P., in the Chair.

Sir PHILIP DE MALPAS GREY EGERTON, Bart., M.P.
The Hon. F. LEVESON GOWER, M.P.
RICHARD DAVEY, Esq., M.P.
P. H. HOLLAND, Esq.

PHILIP ELLIOTT, Esq., 25, Atholl Street, Douglas, Isle of Man.

23,236. (*Chairman.*) You are the surgeon, Mr. Elliott, of Laxey Mine ?—I am, sir ; I attend that mine.

23,237. Do you reside there ?—I do not, sir, but live in Douglas.

23,238. What distance is the mine from here ?—Between 7 and 8 miles.

23,239. How are medical men elected for that mine ; by the men or by the proprietors ?—By the miners themselves.

23,240. How are the medical men paid ; are they paid by subscription from the shareholders ?—I get 50*l.* per year, whatever the men may pay. I did it for 10 years for 20*l.* per year. I found hundreds of men in medicine, too.

23,241. Do you practice amongst the Manx people ?—I do.

23,242. Amongst the agriculturists ?—I do.

23,243. Do you see any difference in regard to health between the people of the town, the agriculturists, and the miners ?—When the miners work in wet places they are subject to swelling of the legs ; that seems to be the prevailing complaint amongst them.

23,244. Have you ever seen anything of what is called "black spit ?"—I have seen men when they have been working in very close places, where there has been a very insufficient supply of air, come up to me and spit in their hands, and then show me a quantity of black saliva or spit.

23,245. How many years have you been medical man to this mine ?—Going on 20 years.

23,246. Can you recollect the depth of the mine when you first went there ?—I cannot.

23,247. Do you observe any difference now in the health of the miners from when you first went there ?—I do not find much difference, but there is a little.

23,248. To what do you mainly attribute this difference of health ?—I attribute it to standing in cold water, in the majority of cases.

23,249. Powder smoke, do you think much of that ?—Very little, indeed, and that only in places where the mine is ill-ventilated ; only where I hear them complaining that the place is badly supplied with air.

23,250. Do you find that they get ill very soon or not ?—No, I do not. I met a man coming from the mine some time since in his shirt sleeves ; he was as able-bodied as any of ourselves.

23,251. Do you think the miners are as healthy as the agriculturists ?—My opinion is that the miners are quite as healthy as the agriculturists of the island.

23,252. Are the health tables in this island as favourable as those in England ?—I should say more so, as far as my experience goes.

23,253. Then you opinion is that the Manx people are, as a class, healthier than other people, and that the health of the miners is nearly as good as the health of the agriculturists and the residents in the town ?—I do think so.

23,254. Are the miners steady men ?—They are not so bad as they used to be. They used to be far worse ; but since teetotalism has come up it has had a great effect upon them.

23,255. Are there changing houses for them ?—They have a house with a fire in.

23,256. Where do the miners who work at Laxey principally reside ?—Some of them live at Agneash ; some at Minorca ; and some of them miles away. There is one that lives at the Cloven Stones, about three miles from Laxey.

23,257. In case of a severe accident, what do they do ?—They send a man on horseback for me.

23,258. Is there an hospital at Laxey ?—No, sir ; there is not one nearer than Douglas, which is the only one we have in the island.

23,259. (*Hon. F. L. Gower.*) Are there any medical men living in Laxey ?—None at present. They have had several there, but the country around is so poor it never would support one. They have tried the experiment ; and have had clever men there.

23,260. Have you known cases of black spit in Laxey and Foxdale ?—I have known cases in both places.

23,261. Which place most of the two ?—I only met with a few cases once now and then.

23,262. Do you know cases of permanent "black spit"?—I am only mentioning those cases where it is not permanent. I never found permanent cases of it.

23,263. Which is the dryest mine ?—I do not know now. They are neither of them very wet.

23,264. Do you attend the Foxdale Mine ?—I am not at present medical attendant at Foxdale ; but I have been going there for years. The men belong to one club or another ; and they think that, because they have a club doctor, that one is sufficient. When I was medical attendant at Foxdale, I had 50*l.* per year. We had men working two miles beyond Ramsey ; one of them got injured and I had to attend him. There was another man at Glenmaye, about 15 miles from Douglas, and I went every day in my life for nine months to attend him. They said I must take his leg off, but I was unwilling to do that as I thought he could be cured without doing so ; and I did make a perfect cure of the man without taking his leg off.

DOUGLAS.
P. Elliott, Esq.
29 Feb. 1864.

23,265. (*Mr. Holland.*) How many men work at Laxey ?—I believe about 600.

23,266. How many are ill at this moment ?—There are a few complaining at this moment of influenza.

23,267. What is about the usual number of sick amongst these 600 ?—Taking it on an average, about 20.

23,267*a*. Is that a fair average ?—Yes ; I think it is.

23,268. What complaints are they generally suffering from ?—Generally from colds and coughs ; and if there is a peculiar tendency in the system these turn into consumption.

23,269. At what age do these men generally become liable to symptoms of consumption ?—It depends on the constitution of the person ; at perhaps five or six and twenty, but generally before thirty than above.

23,270. Do you find amongst Manxmen who are not miners, that more are affected by consumption above or below 30 ?—I would rather say below ; it is not decided as so, but is half and half.

23,271. What do you think it arises from ?—Generally speaking it comes on from colds.

23,272. Are the miners decidedly more liable to chest diseases than other men ?—I do not see it.

23,273. Is this "black spit" you speak of common among them ?—No ; it is not common.

23,274. Does it cease after a short time ?—I never heard any of them making a complaint about it. They never came to me and required medical treatment for it.

23,275. What do you think this "black spit" is ?—I have have seen them come to me and complain ; but they attributed it to the powder. I regard it as incidental.

23,276. You said that some of the miners were liable to dropsy ? — No ; dropsy in the legs, or œdema.

23,277. You said something about their urine ?—It was retention of urine ; they cannot pass it.

23,278. Has that any collusion with dropsy ?—This was one particular case.

23,279. Is this œdema of the legs common amongst miners, or occasional ?— Only occasional. If cold was applied to us we would be liable to the same thing.

23,280. (*Mr. Davey.*) Do you think the climbing of the ladders affects them in any way ?—I don't see that it affects them ; unless there is any thing like asthma.

23,281. Do they ever complain of the heart ?—The complaint is not general.

23,282. What number of accidents have you generally in that mine ?—Very few indeed.

23,283. What kind are they ?—I have had cases of fractured legs. I had one case of a man who fell down into a sump, and a bucket fell on his spine. He has never been able to pass his water since without a catheter.

23,284. How is the 50*l*. a year which you receive raised ?—The men subscribe it. I receive it from the Superintendent. I know it is subscribed by the men, but I do not know in what proportion ; I think one shilling per month is the sum.

23,285. (*Sir P. de M. G. Egerton.*) Have the miners at Laxey any clubs they belong to ?—They mostly belong to two clubs, the parish and "The Miners."

23,286. What do they receive during sickness ?—They get seven or eight shillings per week out of the parish clab ; but those belonging to the "Miners' Club" get six shillings per week.

23,287. Have those clubs medical attendants ?—They have not.

23,288. Do the miners follow any other trade or occupation ?—Most of the men in Laxey are shoemakers, tailors, or agriculturalists, and they sometimes work in the mines, and then do what they can at home.

23,289. Are there persons employed on the surface ?—Yes, there are some.

23,290. Are there any boys employed ?—Yes.

23,291. Are there any females employed ?—Yes.

23,292. Do they all contribute to the doctor to the same amount ?—Not to the same amount. The boys pay sixpence ; but I am bound to attend all the cases that attend either below or above ground.

23,293. (*Chairman.*) Are you bound to attend in midwifery cases ?—Oh no ; they pay that themselves.

23,294. You are not quite sure how this 50*l*. are raised ?—I think it is raised by contributions of one shilling per month.

23,295. (*Hon. F. L. Gower.*) Do you supply medicine for this 50*l*. ?—Yes ; the attendance and everything.

23,296. (*Chairman.*) Do you go there periodically or only when you are called upon ?—I go there every week and whenever I am wanted.

23,297. Have you ever been underground ?—I have been underground in both Laxey and Foxdale.

23,298. Have you been in any of "the close ends ?"—It is some time since, but I do not know.

23,299. I gather from you then that you don't know such a thing as is called a miner's disease ?—I have not seen these cases ; but I have heard them tell me stories about it.

23,300. (*Hon. F. L. Gower.*) There is no permanent disease from this black spit ?—None whatever.

23,301. (*Mr. Davey.*) Do the miners ever complain to you of impure air in the mines ?—They have complained that the candle would not burn, but that is very rare.

LAXEY MINE.

29th February 1864.

PRESENT :

NICHOLAS KENDALL, Esq., M.P., in the Chair.

Sir PHILIP DE MALPAS GREY EGERTON, Bart., M.P.,
The Hon. F. LEVESON GOWER, M.P.

RICHARD DAVEY, Esq., M.P.
P. H. HOLLAND Esq.

LAXEY MINE.
R. Row. Esq.
29 Feb. 1864.

RICHARD ROW, Esq., manager of the mines, Laxey Glen, Isle of Man, examined.

23,302. (*Chairman.*) Mr. Rowe, you are manager of the Laxey mines ?—Yes, sir.

23,303. How long have you been connected with mines, as miner and agent ?—I have been twenty-five years as a miner and agent ; and was fifteen years of age when I commenced mining duties.

23,304. Out of the twenty-five years, how long have you been agent ?—I have been manager of

mines twenty-three years, and a miner before that from twelve years of age, when I first went underground.

23,305. When you were a miner did you work most by tut-work or by tribute ?—On tut-work.

23,306. Did you ever work in a deep mine ?—Never.

23,307. Did you ever work in a bad end ?—I never worked in a bad end.

23,308. Were you the agent in any place before you came here ?—I was.

23,309. Where ?—In the Chiverton mines.

23,310. Do you see any difference in the miners as regards their health there or here ?—I think they are just the same.

23,311. Do you see any difference here in point of health between the miners and the agriculturalists ?—I see no great difference here between the health of the miners and the agriculturalists.

23,312. What depth was this mine when you came here ?—100 fathoms.

23,313. What depth is it now?—210 fathoms.

23,314. You say when you first came, the mine was 100 fathoms, and now it is 210 fathoms ?—Yes.

23,315. Then do you think the health of the miners is worse now than it was when the mines were shallow ?—I gave the question my grave consideration, and I think it is not.

23,316. As you have gone deeper have you paid more attention to the ventilation than formerly ?—I have, sir. I attribute to this the fact that the health of the miner is kept up to the same extent by the improved and careful ventilation.

23,317. Are you ends pretty good ?—They are, the majority of them.

23,318. Which do you call your worst end ?—We call the 145 end our worst at present. In other portions of the mine the air is better in consequence of artificial means being used.

23,319. What artificial means do you use ?—Forcedocks and the water-blasts.

23,320. How far is the end off from any winze ?—It is 200 fathoms from any winze in a straight line. That is the nearest in a straight line, but there are various windings that will give it more.

23,321. Is the air good ?—Notwithstanding it is 200 fathoms the candles burn well and the air is good.

23,322. What is your test ?—The opinion of the men and the candle. The men are satisfied, and the candles show no marks of bad air.

23,323. Have you any other means of testing ?—No ; if the candle burns well we think that the best test.

23,324. How soon after a blast can the men go to work again ?—With a degree of comfort, in ten minutes.

23,325. Take that which you say is worst now—the 145 end—where you have no artificial means now, what depth is it ?—It will be 100 fathoms.

23,326. Is the air good there ?—The air is bad there.

23,327. How many men work in the 24 hours there ?—Eight men. They are divided into two parties and are expected to work eight hours each. That will make 16 hours, and the other 8 hours are left idle. We allow the men to leave when it is intolerable.

23,328. How long has the air been so bad as it is now ?—It is increasingly bad as we get away from the shaft.

23,329. How long have you hitherto put in the stopes ?—That level was pointed and is now resuming. It was pinned in, and we have just resumed it, and we are about to apply the jet.

23,330. How long will it be before you have artificial ventilation there ?—We have a blast laid out there. We will use artificial means until we make some discovery, and then we will have ventilation from above.

23,331. What per fathom are you making now ?—12 tons per fathom at the 145.

23,332. And what at the 110 ?—I think 13 per fathom.

23,333. Do the men suffer much from climbing up and down ?—That is the principal thing, I think, if they suffer at all.

23,334. How do they suffer ?—If the disease is anything at all it is asthmatic.

23,335. Do the young men only go down to the bottom levels, or do old and young go together ?—They go just as they happen to be arranged. We keep one of the old men down as well as the young, but the old men go down.

23,336. Do the old men seem distressed when they come up ?—No, not at all.

23,337. Are you in favour of man-engines or skip ?—I have had no experience in them.

23,338. Do you work by tribute or stoping ?—Where we work by tribute we work an easier end.

23,339. Is there any difference in the health of your tut workmen or your tribute workmen ?—No difference.

23,340. What is the average wages ?—About 18*s.* per week.

23,341. Are the bills made out in the same way as in England ?—Yes, in the same way.

23,342. With regard to the clubs, what do the miners pay ?—The miners pay 1*s.*, and the labourers 6*d.* per month. They get for that, 6*s.* per week when ill, and the doctor's attendance.

23,343. Are the families attended for that sum ?—They are, I believe, in every case, except their wives' confinement.

23,344. Do you keep a separate account of your club money ?—We do not ; it is done by a committee of the men. The men have the distribution of the money themselves. We look over them to see that nothing is improperly done. If there is any dispute they refer to us. The money is in the hands of the men ; and the balance, if any, in the banker's hands in their names.

23,345. If any, you say ?—Yes ; I think they appeal to the club in little sicknesses, and they appeal to it often.

23,346. And do you think there is more imposition in the club being managed by the miners themselves or by the agents ?—I do.

23,347. Then would it not be better for the agents to have the management of the money ?—They are better pleased by the way they are.

23,348. Does the club pay its engagements ?—It is never unable to pay, for if they should be short of funds they make a double levy, and pay two shillings instead of one shilling.

23,349. How is the doctor paid ?—He is paid so much per year, which is handed over to the doctor by the committee when due.

23,350. How are the men's wages paid ?—They are paid by the treasurer, and if paid once a month they have no subsist. We have decided to give no subsist at all.

23,351. If the man came in today, would he get his pay this day month ?—The fact is, we have two months' pay in hand.

23,352. How does he subsist in the meantime ?—He trusts to the shops.

23,353. How are the men paid ?—In local notes or gold.

23,354. In what proportion of each ?—That depends on what the banker sends us.

23,355. Do they go to the public-house or not to change it ?—They do ; but I should say that the majority of the men go to the shops and cash their notes.

23,356. Taking the men as a class, do you think they have improved ?—Decidedly, sir.

23,357. Do you visit their houses ?—I do.

23,358. Do you consider them improved ?—They are much improved.

23,359. Do they sleep too many in the same bedroom ?—They do that still too much.

LAXEY MINE.

R. Rowe, Esq.

29 Feb. 1864.

23,360. How many do you know of?—I know one case of six sleeping in a room.

23,361. What size is the room?—12 feet by 12 feet.

23,362. Do they appear to suffer from it?—No; but that is an extreme case.

23,363. Do you supply powder and candles to the men?—Yes, but they pay for them.

23,364. Do you charge them more than cost price?—Yes, we do.

23,365. Why?—Because it is the custom.

23,366. How much are they allowed per week?—Two and a half pounds.

23,367. (*Mr. Holland.*) I think you said the miners pay one shilling and the labourers sixpence per month to the club?—The underground men of the mine consist of younger men coming on to the mines. The labourer gets less wages, but receives an equal amount of pay from the club.

23,368. Does the club lose by the labourers and gain by the miners?—I think that the young men, having less cause to appeal to the club, make up the difference.

23,369. Have you ever seen miners in Cornwall suffering from miners' consumption?—I have seen one or two cases of decline; but I have not seen half-a-dozen cases of miners' consumption here since I came here.

23,370. How many underground men have you under instruction?—About 300 underground men.

23,371. Have you made any estimate of the money profit and loss of ventilation?—No, we have not.

23,372. Has the cost of this artificial ventilation been considerable?—You will understand, we have regularly ventilated as a means of getting the mine worked, so the expense has never been valued, as it has been part of the working expenses.

23,373. Have you any means of judging whether the ventilation brattice put up has paid its cost?—It has more than paid for any outlay or cost.

23,374. (*Hon. F. L. Gower.*) Do you consider the mine you worked in in Cornwall more healthy than the generality of Cornish mines?—Yes, I do. Our lead mines in the district I was brought up in were more healthy than those in the southern part of the district. In Chiverton the miners were more able-bodied.

23,375. Then you think the miners here are finer men than the Cornish men?—I do, sir; than those working in the deep Cornish mines.

23,376. In Cornwall you knew more disease?—I did, sir.

23,377. Then in Cornwall are they less healthy, and what makes the difference?—I attribute the difference to the peculiar character of the Manxmen. They are tougher and stronger, and their longevity is greater than among my own Cornish men. Talking of their individual health, I think the rate of health would be about the same; but I am of opinion that taken collectively the Manx are a stronger lot of men.

23,378. But do they work at the ladder much more here than they do in Cornwall?—They do.

23,379. Are they all Manxmen here?—The majority are.

23,380. Do the men complain of the badness of the air before the candle is affected?—They will complain before the candle is affected.

23,381. At what age do the boys begin to work underground?—The majority from 17 to 18.

23,382. What age is the youngest there?—From 15 to 16.

23,383. (*Mr. Davey.*) If you take your own parish of St. Agnes, what is the difference of the disease?—I have encountered more disease here.

23,384. Have the miners little farms or anything?—They have just the little plots they cultivate for themselves.

23,385. In using your water blast, is it done by the hand or by the wheel?—The water blast is naturally conveyed running down to the adit level, and acts in the box to where it is applied. The water blast is from the adit shaft to the adit level.

23,386. Will you describe how you use the water blast?—The water blast consists of a fall from the top to the adit level, distant 30 fathoms. The water, after accomplishing this work, goes into the level, and comes to the surface. The air so created is then carried to the shaft by wooden pipes. These pipes are three inches within, and thus the air is sent down to the different levels.

23,387. What is the rate of the air?—It is constant, as the water flows regularly.

23,388. What other means have you?—By a duck engine, worked by a large wheel. The size of the duck is three feet square, and it is attached to the main rods. Its rise and fall is seven feet, and it gives four strokes per minute, and 252 feet per minute.

23,389. Which is the most powerful, the blast or the duck?—The duck is the most powerful.

23,390. (*Mr. Holland.*) Where does the duck get the supply of air from?—From the shaft.

23,391. (*Mr. Davey.*) What distance will the duck engine throw the air into that particular end?—It will do it for 250 fathoms.

23,392. How many men have you working in the end of 110?—Eight at a time.

23,393. (*Chairman.*) How many men were working in the end before you put on the water-blast?—We had four at a time; now there is eight.

23,394. The duck would not have been enough for eight alone?—It might have been; but we intend ourselves to leave it there.

23,395. Were they rather short of air with the duck alone?—We would be afraid to put it in.

23,396. (*Sir Philip Egerton.*) Do the men employed in this mine live pretty well?—They do.

23,397. Do they take their meals at home?—They take a small portion in the mine; the other meals they take at home.

23,398. What distance do they live from the mines?—Some about half-a-mile, and others about three miles.

23,399. Have you any place provided where they can change their clothes?—There is.

23,400. Is there attached to that place a dryer?—There is.

23,401. And do you find that since these accommodations have been provided they make use of them?—Yes, they do; but there is some little exception.

Mr. JOHN KITTO, Laxey Mines.

Mr. J. Kitto.

23,402. (*Chairman.*) How long have you been agent here?—A little more than two years.

23,403. Is this the first time you were agent?—I was agent before I came here.

23,404. How long did you work as a miner?—I worked as a miner seven years underground, and was a boy on the dressing-floors at ten years of age.

23,405. What mine did you work in before you came here?—I was an agent at Swanpool mine.

23,406. Is it a deep mine?—Eighty fathoms.

23,407. Did you ever work anywhere in impure air?—In Abergowden, in the seventy fathoms.

23,408. Did you suffer?—I did not suffer, for I did not work long.

23,409. Did you see the men very different to what they are here?—I agree generally as to that, with what Captain Rowe has stated to-day.

23,410. Is there any suggestion you wish to make?—None whatever.

23,411. Is there anything we have omitted to ask?—Nothing, except as to accidents.

23,412–13. Are accidents rare here, or not?—(*Captain Rowe.*) Very rare indeed. We had a severe accident from blasting within the last week, which is the only one we have had within nineteen years.

23,414. How did that arise?—It arose while the man was tamping.

23,415. Was the man much injured?—His sight was injured.

23,416. Does he know how it occurred?—He stated he cannot tell; but it arose when he was using the tamping bar.

23,417. What straw do you use here?—Oat straw.

23,418. Do you find there is much loss of time from descending by the ladders?—It is rather important.

23,419. Have you had the matter under consideration?—Yes, we have talked about it.

23,420. Would not a skip do better?—It might.

23,421. (*Mr. Davey.*) Suppose you were to recommend anything to the directors that would be for the benefit of the mine and the miners, would they object to it, or cavil at the expense?—They support me always, and have never cavilled.

FOXDALE MINE.

1st March 1864.

PRESENT:

RICHARD DAVEY, Esq., M.P., in the Chair.

The Hon. F. LEVESON GOWER, M.P. | P. H. HOLLAND, Esq.

JOSEPH LEE THOMAS, Esq., Associate of the Institution of Civil Engineers.

23,422. (*Chairman.*) You have the management of this mine?—I have.

23,423. How long have you been here?—Five months.

23,424. What is the depth of the mine?—It is 100 fathoms below the day level.

23,425. How many men have you employed?—We have altogether 214 underground men.

23,426. Do they work by tribute or by tutwork?—The ore is all done on tribute; the ends are done on tutwork. If the ground is poor we give them tutwork.

23,427. How do you estimate your tribute; by so much in the pound, or by so much per ton?—By so much per ton.

23,428. Do you make any distinction when there is any difference in the valuation of the ore?—Yes, sir.

23,429. Have they any fixed standard?—No, we dress it ourselves.

23,430. How do you descend the mine?—By means of ladders.

23,431. What kind of steps have you, wood or iron?—Iron; occasionally they are wood.

23,432. What is the distance between each?—Ten inches.

23,433. Do you find the men complain in climbing the ladders?—Oh, no.

23,434. Is there any peculiar disease belonging to the men?—Oh, no, I never heard of any.

23,435. Do you know what they call a miner's disease in Cornwall?—I have not seen anything of that since I have been here. I have heard of men dying from bad air.

23,436. Is there any asthmatical complaint?—I do not know of any.

23,437. Of what age do you call an old miner?—We have miners here over 70 years of age.

23,438. From what you have heard, are you aware that there has been a great improvement in the working of the mine during the last 20 years, so far as regards ventilation?—I think there has. You will find that poor mines will be worse ventilated than good mines. You will find that these good mines must be worked in a good way, or left altogether.

23,439. I suppose there is a limit to the quantity of powder and candles delivered to the men?—Yes, we give them what we think enough for them.

23,440. What do you charge them?—We charge them cost price, as near as possible.

23,441. Are your men naturally strong men?—I think they are.

23,442. Are they steady?—I think they are. There is only one public house in the village. We have nine men working in our engine-shaft, and they are all teetotallers.

23,443. Do you make any profit by supplying the men with any materials that they may require?—I believe we make no profit. We calculate the price to cover the articles, so as to cover our own cost upon them. Supposing we made a profit, we should lose another way, for we should injure ourselves. Any profit made by the sale of materials would be apparent and not real.

23,444. What is the rate of wages?—The rate is 17*s.* 6*d.* per week, after all deductions.

23,445. (*Hon. F. L. Gower.*) Were you connected with any mine before you came here?—Yes, I have had the management of some large establishments. I had the management of the Linares and Fortuna mines in Spain.

23,446. Did the miners suffer there in their health?—Yes; occasionally. We had the same compiaints as regards bad in these mines.

23,447. Was the ventilation worse there?—I think it is more difficult to get more air there. If not bad, the ventilation is painful.

23,448. Do the miners suffer from what is called "miner's disease"?—I never heard any of them complaining.

23,449. Have you ever been in Cornwall?—I never managed any mines there.

23,450. Have you ever managed any mines in Great Britain besides these?—No, but I have been over most of them.

23,451. Have there been any accidents in this mine since you managed it?—Yes.

23,452. What nature?—There was an accident from two parties of men who were driving levels to meet each other. They had not warned one another, so three of them were injured. The fourth man was badly injured, and may lose his sight.

23,453. Was that accident due to the carelessness of the men?—Yes, sir.

23,454. Was that from the want of giving a signal?—Yes. The usual way is that they should rap, and be answered. They omitted rapping. They were so near that they took to speaking to one another, but their voices were not heard, and they fired their blast and it went out the other way. It might have killed them; but providentially it did not.

23,455. Have you any changing houses for the men to change their clothes in?—Yes, sir; within one hundred yards of the shaft.

FOXDALE MINE.

J. L. Thomas, Esq.

1 March 1864.

23,456. Do the men always change their clothes before they go home ?—Invariably.

23,457. Do the men live near the mines ?—Generally speaking near; but some live within three or four miles off.

23,458. Have the men any club ?—Yes ; they have.

23,459. Does that include doctor's attendance ?—It does not ; we find doctors for them in case of dangerous illness, and the medical apparatus and sticking plaster. We found it difficult to arrange for the men to be attended with the same doctor. Some were in favour of a doctor from Douglas ; others from Peel ; but now, in casesof accidents of any kind, we allow the men to choose their own doctors, and we pay them.

23,460. Do the men pay anything towards the doctor ?—The men pay a certain amount towards their club ; and that money is restored to them by instalments of so much per week when they are ill, and by their having the doctor in case of accident. The doctor is paid from the club money ; and we generally manage to keep our club with a small balance in hand to meet cases of accident.

23.461. Is the money paid to you, or have they a committee themselves ?—No ; the money is paid to us. There was a commiteee of themselves, but they managed it badly, and so it was thought better to put the matter into better hands than theirs.

23,462. (*P. W. Holland, Esq.*) What amount do they subscribe to the fund ?—1*s.* per head per month by the men underground, and 6*d.* by the men and boys on the surface.

23,463. What do you allow them when ill ?—We allow them 6*s.* per week when ill, and 8*s.* per week in case of accident.

23,464. Does that keep the account pretty square ?—It does. We generally keep a slight balance to the credit of the account.

23,465. Is that balance small in proportion ?—There is no addition to the balance ; it is about the same at the end of each year.

23,466. Am I right in concluding that the men who pay 1*s.* per head per month and receive 6*s.* a week when ill, cannot suffer, therefore, on the average more than a fortnight per annum ?—I believe you are pretty correct.

23,467. Are the persons who pay 6*d.* a month younger ?—No.

23,468. Then why do they pay a smaller sum ?—Because they are receiving rather less wages.

23,469. Is the proportion of sickness proportionate with the expenses, or not ?—No, but because they earn less and are, therefore, less able to pay the money. The underground men are more liable to accidents ; they earn more, and can afford to pay more. The surface men are not so liable to injury.

23,470. Do miners look decidedly older than other men of the same age, when they get to about 50 years of age, or not ?—No, I think not.

23,471. Is there any marked disease amongst miners to have them noticed ?—No, I think not. I should say that here they are in better health and in better condition than agriculturists.

23,472. Do you think they keep their health better ?—Yes, they do.

23,473. (*Chairman.*) Supposing you were to expend the whole money of the club, would the men willingly contribute an extra shilling per month ?—I don't think they would. They would have to look for their average ; and they would look for a certain amount of wages.

23,474. Would you be kind enough to describe how far the dead end is from any sump or winze in your mine ?—Well, we reckon it about 70 fathoms.

23,475. How do you find the air there ?—The air is dead there ; we cannot work with six men there.

23,476. Are you making any preparation to have it ventilated ?—The pipes are ready to go down.

23,477. Have you any other place you would like to complain of ?—I have heard no complaints.

23,478. What way do you ventilate ?—The usual thing is a fan, worked by a boy.

23,479. What size pipes do you carry air through ?—About three-inch galvanized iron tubes, costing about 8*d.* per foot.

23,480. How do you pay your men ; how long before you pay them after a man takes his work ?—After a man takes his work he will not receive pay until the following month. If a man takes work on the 1st of March he will get nothing until the 1st of April ; that will be his subsistence.

23,481. How much do you give him to subsist on ?—We give him a regular amount ; generally speaking about 30*s.* a man.

23,482. Then when would the ore be drawn ?—The March ore will be drawn and proved in April, and paid for in April.

23,483. How if it were a tut workman ?—They would be measured on the 1st of March, and given their subsistence. If we knew the men worked well, we would give him more.

23,484. Then you would pay the balance on the 1st of May ?—Yes.

23,485. (*Hon. F. L. Gower.*) Was there any other accident besides the one you described to us ?—Yes ; there was an accident in which one man was killed. The shaft men were clearing a trip-plat at the 72 fathom level, and a portion of the ground came down upon one of them, and so injured him that he died in the course of four and twenty hours.

23,486. Was that owing to his own carelessness, or was it purely accidental ?—The men say that the block of ground which came down sounded sound, but it came down upon him unawares.

EDWARD KELLY examined.

E. Kelly.

23,487. (*Chairman.*) What age are you ?—48, going on 49.

23,488. Have you been working in these mines for a long time ?—Yes ; for 32 years.

23,489. In what capacity ; as tutter or tributer ?—I have worked as a tributer, and as a labourer in sinking shafts ; but for the last 10 years I have been minding the pit work.

23,490. How has your health been ?—I have enjoyed very good health. I don't think I have had more than a day's sickness in bed within these last 20 years.

23,491. Have you never felt any ill effects from climbing the ladders ?—No ; and I don't yet.

23,492. Did you ever work in bad air ?—Yes, I have.

23,493. What was the greatest distance from the sump ?—I have worked as far as 70 fathoms from the sump or place of ventilation.

23,494. What means of ventilation did you use when you were so far from the sump ?—We had'nt applied any. We could not go any further, and we then employed duck machines.

23,495. Did you, sir, go so far until you could get no further ?—I never was in any place that I was obliged to give it up.

23,496. Has there been any improvement in the ventilation ?—There has. There have been more sumps sunk and larger levels cut.

23,497. What size do you carry your levels now ?—Four feet and a half wide by seven high.

23,498. That carries in a good current of air ?—Yes, we carry in a good air with that.

23,499. Then you don't carry in anything with you to get air ?—We have fire now.

23,500. How did you discover the air was bad ?—By the candle first. I found I could breathe myself where the candle burns dull. I never suffered when the candle was fed. I thought it was wisest to get more air when the candle didn't burn.

23,501. You mean to say that you could work

where the candle did'nt burn freely ?—I have worked in places where the candle did not burn freely.

23,502. Are the feeders in good repair here ?—I think they are good here, and I look to them two or three times a week.

23,503. You never met with an accident yourself, did you ?—Never, not one of any consequence.

23,504. Since the time you have been working here, have accidents been frequent ?—There has been a few.

23,505. What did they arise from ?—From pieces of soft ground coming away without notice.

23,506. Is it usual for the ground to fall away in this mine ?—Yes. The ground runs up and then falls down in a good lump.

23,507. How far do you reside from the mine ?—I live about 20 yards from the mine.

23,508. Are the men provided with good cottages here ?—Yes, good for working men.

23,509. Have they any fields attached to them ?—Yes, some of them have, and some of them have little bits of fields and keep a cow.

23,510. Do you consider your comrades a quiet set of men ?—Yes.

23,511. Are there any other clubs in the neighbourhood, beside the one attached to the mine ?—There is a branch of the Odd Fellows, and there are 130 men in it.

23,512. What do you pay per month ?—We pay two shillings per month.

23,513. What do you receive when ill ?—10*s.* a week.

23,514. Do you employ a doctor at your own expense ?—We have a doctor belonging to the Odd Fellows' club.

23,515. Have you the benefit of applying to the mine doctor as well ?—Well, I suppose that lies with Mr. Thomas. There is no obligation to get a doctor, but they can get one if they like.

23,516. In illness would they provide it ?—I never was ill, and I don't know what is done for other people.

23,517. (*Hon. F. L. Gower.*) How many fatal accidents have there been since you have worked in this mine ?—Perhaps 15 or 16 in all.

23,518. Have the most of those accidents occurred from the falling away of the ground ?—Well, some of them. I recollect one man falling from the ladder.

23,519. Was that his own fault ?—I don't know. He was standing by himself, they said. Two men went down to take a door off one of the lifts, and he dropped beside them, but they could not tell how he fell.

23,520. Do the miners appear to you to be in better health now than when you were young ?—I think they do.

23,521. (*Mr. Holland.*) Are miners as healthy here as farm labourers ?—I think they are. I know there is one man here, Mat. Smith, who has worked underground for the last forty years, and he is eighty years of age now.

23,522. Is mining considered an unhealthy employment here ?—I never heard that it was.

23,523. Do the miners do any work aboveground ; I mean the gardens in the fields ?—They do ; some of them have little bits of land, and they will do little bits of jobs at home in their gardens.

23,524. Is that a general thing with them ?—Yes, it is.

23,525. Are there many who don't do so ?—Some.

23,526. Is there any difference between those who do and those who do not ?—I have not seen much difference.

23,527. Have you worked in air so bad as to prevent you doing a fair day's work ?—No, sir.

23,528. When the candles begin to burn dim does it affect you, and prevent your doing a good day's work ?—No ; I have not been prevented doing a good day's work by that.

23,529. Have you ever known powder-smoke hang longer than quarter of an hour ?—Sometimes it will hang for half an hour where it is still warm. I have seen some cases where it has hung longer, but it would not hang warm.

23,530. Was it disagreeable ?—No ; I always stood back till the place was cold ; till the smoke cleared out a little.

23,531. Do you think candle-smoke disagreeable ?—No.

23,532. Does the dust annoy you much ?—I believe it is annoying in dry places ; but I have been working in damp places myself, so I cannot tell.

23,533. Are there dry workings in the mine ?—There are.

23,534. Sufficient dust to be disagreeable ?—No, I think not ; but it will dust a little when you work the tools against the ground.

23,535. Are there many of the miners who are quite free from "touch" in the wind ?—There are a good many who are not touched in the wind.

23,536. Can they run and walk as good as any men ?—I think they can.

THOMAS WHITTAKER examined.

23,537. (*Chairman.*) What are you ?—I am a clerk.

23,538. Have you resided long in this neighbourhood ?—Seven years.

23,539. Are you well acquaited with the miners living here ?—Pretty well ; I know them all.

23,540. Do you visit their cottages ?—Sometimes.

23,541. Have you any knowledge of the manner in which they live ?—I have, of some of them.

23,542. The working miners, for instance, how do they live ?—Some of them live pretty fair.

23,543. What is their food generally ?—They have butcher's meat—beef and mutton ; milk and potatoes, and herrings, and fish of all kinds ; that is their principal food.

23,544. Do they provide themselves regularly with their food ?—They generally provide a stock of herrings.

23,545. Then they do not spend much of their money at the public-house ?—There are a few who tipple ; but ordinarily they are a very steady set of men.

23,546. Do you know anything of the agricultural labourers ?—Yes, something.

23,547. Do you know how they live ?—I don't think they live so well as the miners ; their pay is not so good.

23,548. What is their pay ?—About 10*s.* per week.

23,549. A little more than half of the miners ?—About that.

23,550. They have not the means of living ?—No.

23,551. Are they steady ?—The majority of them are.

23,552. Are the cottages of the miners kept pretty clean ?—Some few of them are rather dirty.

23,553. Are they cleaner or dirtier than those of the farm labourers ?—On the whole they are cleaner.

23,554. Are the miners' cottages generally more roomy ?—They are.

23,555. Have the farm labourers generally got fixed windows in their cottages ; I mean windows that will not open ?—The old houses generally have fixed windows ; but in all the houses lately built the windows are made to open.

23,556. Do most of the miners live in these new houses ?—Yes.

MEDICAL REPORT

By Thomas B. Peacock, M.D., F.R.C.P., Physician to St. Thomas's Hospital, and to the Hospital for Diseases of the Chest, Victoria Park, on the Condition of Miners in West Cornwall.

The following report is the result of observations made during two weeks spent in the mining districts of West Cornwall in July and August 1862. I then visited the Par Consols mine near St. Austell, the Dolcoath and United mines in the Camborne and Gwennap districts, the Wendron Consols in the neighbourhood of Helston, the St. Ives Consols near the town of St. Ives, and Botallack, Levant, and Wheal Owles in the district of St. Just. At the same time I took notes of 83 cases of different forms of disease met with in miners in the districts named and in the neighbourhood of Liskeard, and examined upwards of 500 men who were found at work in different mines, or who had formerly been employed as miners.

General Condition of the Miners.

In examining, even casually, a large number of miners, it is impossible not to be struck with the peculiarly delicate appearance of many of them, and especially of the older men and of the boys and young men who have worked under ground only for a short time. Instead of having the bright and clear complexions of the young people employed at the surface, those who labour in the mines have a very pale sallow appearance, and this they seem to acquire even after having worked underground only for a few months. The middle aged men are less unhealthy looking, but those who have long worked in the mines and are verging towards old age have a prematurely old apparance, a stooping gait, and an anxious expression of countenance. They are thin, pale, and sallow, and have peculiarly dingy complexions. For men following a laborious occupation they are by no means muscular, and very generally their pulse at the wrist is feeble. If inquiry be made of them they frequently acknowledge that they are not in good health, complaining of dyspeptic symptoms, want of appetite, qualmishness, sense of weight or flatulency after taking food, sometimes pain at the pit of the stomach, and occasional vomiting of the food, and an uncertain condition of the bowels, either confinement or diarrhœa. Very frequently also they suffer from pains in the back and limbs and failure of muscular power; or from breathlessness, especially on any active exertion, tightness at the chest, chronic cough and expectoration, and palpitation of the heart.

Many of the young and middle-aged men are healthy and robust-looking. Some also are seen, even at advanced periods of life, who state that they have been miners all their lives and are still going under-ground or have only recently ceased to work below, who nevertheless are hale and strong and free from appearances or symptoms of disease. Comparatively few men are, however, found at work who have much passed the middle period of life, and still fewer who under such circumstances appear and report themselves to be in good health.

The facts upon which these statements are made are confirmed by the reports given in the appendix. It will be there seen that in various mines I carefully examined and took notes of the condition of 464 men and boys who were found at work. Of this number 117 were of ages from 9 to 20, and of these 42 appeared and stated themselves to be quite well, 38 were pale or had a worn appearance, 37 were either decidedly delicate looking or complained of some symptoms of indisposition, the proportion of the latter being therefore 31·6 per cent.; 233 of the men were from 20 to 40 years of age, and of this number the proportion of healthy men was larger; the number of the healthy being 112, of the pale and worn 59, and of the decidedly ailing and delicate 62, or only 26·6 per cent.; 114 were between 40 and 63, and of these the healthy were 43, the ailing 62, the latter constituting 54·3 per cent. Altogether of the 464 men examined 197 were healthy, 106 pale or aged looking, and 161 presented symptoms or appearances of impaired health, the ailing thus constituting not less than 34·6 per cent. It will also be seen that of the men who were labouring under different forms of disease 49 were regarded as permanently incapacitated from working again as miners and many of them from performing any active labour, and of these persons the average age was 43, the youngest being 21, the oldest 66 years old. The period during which these men

had worked under-ground varied considerably. The mean period of work before the commencement of their attacks of illness was 28·5 years; one man had however only been able to work for five years, another had been a miner for 53. These facts show a decline of strength and a failure of health at periods of life much earlier than those at which men engaged in out of door occupations at the surface ordinarily become invalided. It would have been satisfactory to have instituted similar investigations as to the state of a considerable number of men employed in similar occupations at the surface in the same districts. This the time at my disposal did not afford me the opportunity of doing. From, however, the limited enquiries and observations which were made I do not hesitate to assert that the condition of the mining population is much less satisfactory in a sanitary point of view than that of men employed in laborious occupations out of doors, as masons, stone-cutters, farm labourers, fishermen, &c., that their capacity for severe labour is exhausted at an earlier period of life, and that their health also fails at an earlier age.

The forms of indisposition which were met with among the miners were the following :—

Diseases of the Miners.

1. *General Debility, Indigestion, Rheumatism, &c.*—I have already alluded to the delicate state of many of the miners and to the frequency with which they complained of dyspeptic symptoms and of rheumatic pains. Generally, however, these affections are not so severe as to prevent their working, but the men are constantly ailing, and on the occurrence of some slight exciting cause, a trivial accident or an ordinary cold, have attacks of severe illness and are laid by for a long time before they are capable of resuming their work underground.

In some cases also the dyspeptic symptoms are very severe. The miner has little appetite; the food which he takes causes flatulency, pain or sickness and vomiting. His bowels are in an uncertain state, often obstinately confined, in other cases relaxed, or passing from one condition to the other. Symptoms of hepatic disorder are not uncommon. Several of the men stated that their illnesses of different kinds commenced with attacks of jaundice, and the ailing men have very frequently a more or less deep bilious tinge of the eyes and surface generally. They suffer also from piles and pass blood by stool, sometimes to such an extent as materially to reduce their strength.

In three cases the dyspeptic symptoms were so severe as to have unfitted the men for work, and in two of the cases there could be no doubt that there was serious organic disease of the stomach and other viscera. These patients were aged 52, 61, and 67; they had worked underground for 36, 50, and 51 years respectively, and had been laid by for 7 months but previously ailing 2 years, for a year and a half but far from well for 6 or 7 years, and for 4 months.

Rheumatic affections of different kinds are, as would naturally be supposed, extremely common among the miners. Generally they take the form of subacute rheumatism or of chronic pains affecting the trunk or limbs, especially the back and loins,—lumbago, or the hips,—sciatica. In few of the cases of disease among the men were some symptoms of this kind absent. In the cases of chest affection pains in the sides, apparently intercostal rheumatism, were common, and occasionally excessive tenderness of the surface was found. Several of the men said that they had formerly had attacks of rheumatic fever, and I met with one case in which mitral valvular disease had supervened on such an attack, and a second in which there had been symptoms possibly of slight rheumatism at the time the cardiac affection commenced.

In one instance a man had paraplegia caused by working with his legs in cold water; a second patient, who also suffered from miners' asthma with mitral valvular disease, had been subject to rheumatism for many years, and after a slight twist of the leg felt something give way in the knee and had not been able to work since. He apparently had a false cartilage in the joint, which on his using any exertion produced irritation. He had worked several years under ground as a miner but had latterly been employed in the "sump shaft." Another man, 45 years of age, who had worked in damp and draughty shafts, was entirely incapable of working from chronic rheumatism.

2. *Slow Fever.*—The miners frequently state that they have suffered from what they call "slow fever." This term they evidently apply to at least two distinct forms of affection. One of these is the ordinary typhoid or continued fever, well known to be generally due to the decomposition of animal matter and consequently to be met with in imperfectly drained houses and districts. This affection I saw both in Camborne and St. Just, and at the latter place found that it had prevailed extensively and fatally. Nor was this surprising when the state of the cottages was considered, for they displayed in many cases all the circumstances which are well known to be conducive to the development and spread of the disease. The other form of affection is one which is clearly due to the occupation of the miner, and of this I met with two very characteristic cases, and the symptoms were frequently described to me by other persons who had suffered from the affection.

The disease usually appears to commence gradually after the miner has been working under ground for some years. It generally occurs after he has been employed in a close end where there has been very imperfect ventilation or great heat, or when he has been working at tribute for some time at a scarcely remunerative rate, so that he has not been able to obtain an adequate amount of wholesome and nutritious food. The patient's appetite first fails, often he experiences an entire repugnance to food and the little which he takes does not agree with him, giving rise to sense of distension, weight or pain, or being followed by retching and vomiting. There are frequently colicky pains in the abdomen; the bowels are confined, and the patient not unfrequently has piles, passes blood by stool, and has pain or tenderness in the region of the liver. He usually also suffers from headache, dizziness, and depression of spirits, rapidly loses flesh, and soon becomes so prostrated as not to be capable of continuing his work. The failure of power is sometimes first experienced in the arms in striking; more frequently, however, there is weakness in the loins and lower extremities, especially experienced in ascending the ladders; and usually there are pains in all parts of the body and particularly in the back and limbs. With these symptoms there is generally some shortness or difficulty of breathing, but rather from weakness than any active affection of the chest. Marked feverish symptoms are also experienced, burning heat in the palms of the hands and soles of the feet, aggravated towards the after part of the day; with extreme restlessness at night, so that the patient obtains no sleep and rises in the morning less refreshed and more prostrated than when he went to bed at night. In one of the cases which I saw there was a peculiar desponding or depressed expression of countenance, and the face was sallow and pale but very unlike the sallow paleness of a person suffering under malarious influence. The sufferer had a peculiar glassy eye, the tongue was thickly furred and the breath offensive; there was some tenderness in the region of the liver and the bowels very much confined. There was no impairment of the resonance on percussion in any part of the chest, but the chest did not move freely and fully with the inspiratory and expiratory acts and the respiratory sounds were very feebly heard. The heart's sounds and action and the pulse at the wrist were also feeble.

This form of affection seems to be very aptly termed "slow," it prostrates the patient, and renders him altogether unfit for work, without being at any time actively ill. He is rather out of condition than ill, and is proportionately long before he recovers his health and vigour. The men state that when they feel themselves a little better they frequently try to resume their work underground, but a few days, or even a few hours, often again prostrates them and compels them to relinquish the attempt. One of the patients to whom I have referred was a man 37 years of age, who had worked as a miner for about 20 years without suffering from his occupation till the occurrence of the attack. When I saw him he had been laid by for 7 months, and though he had two or three times attempted to resume work, he had soon been compelled to give up again. The other patient was a man 38 years of age, who had worked underground for about 25 years. He when seen had been incapable of work for five weeks.

The result of this affection varies. I met with instances in which the men said they had suffered from "slow fever" for several months, 15 or 20 years before, and had entirely recovered from it, and been able to work steadily ever since. In other cases, however, it is only the commencement of a state of indisposition which is never entirely overcome, and ultimately determines one or other of the forms of disease to be hereafter described.

3. *Affections of the respiratory organs.*—By far the most common forms of disease met with among the miners are affections of the respiratory organs, asthma, bronchitis or pneumonia or the two combined, and phthisis or tubercular consumption. Indeed, of 83 cases of disease tabulated in the Appendix, 54 or 65·06 per cent. were of this description.

Miners' Asthma.—The broncho-pneumonic and asthmatic affections are so common as to have received from the miners, and indeed in the district generally, the names of miners' asthma, disease or consumption, and of the 54 cases of disease of the respiratory organs 41 may be regarded as of this description.

The disease is described as varying considerably in its

mode of commencement. In some cases it supervenes after the occurrence of cold or a state of prolonged but slight indisposition, as dyspepsia or rheumatism. In others it occurs suddenly with a severe attack of inflammation of the chest, occasioned by cold taken in the mine or at the surface. When the disease originates in the former mode, it appears to have a special tendency to run into chronic asthma, with increasing difficulty of breathing and impairment of general power. In the latter mode it more frequently is attended by active febrile disturbance and terminates in consolidation of some portion of the lungs, from which the patient never entirely recovers, but is left continually suffering more or less from cough and expectoration, with increasing debility. In the former class of cases, or as I should regard it, in uncomplicated miner's asthma, the physical signs are often very slight in the earlier stages and afford little explanation of the difficulty of breathing, prostration of strength and palpitation, under which the patient labours. On carefully examining all parts of the chest, the only morbid conditions detectable are often the want of full and free expansion, general feebleness of the respiratory sounds, and extreme weakness of the sounds and action of the heart and pulse at the wrist.

In the advanced stages, however, the symptoms of asthma and the signs of emphysema become very marked. The difficulty of breathing is extreme, and is aggravated by any slight exertion, as by ascending stairs or a slight elevation, and it is usually much increased by certain states of atmosphere and when the patient takes cold. Notwithstanding the great effort which is made in breathing the movements of the chest are most imperfect, there is little change of capacity with the inspiratory and expiratory acts, and the respiration is almost entirely abdominal. The patient speaks slowly and interruptedly, and often is not able to count aloud to10 or 12 without drawing a fresh breath. The shoulders are raised, the supra-clavicular spaces much depressed, and the chest covered by large and distended veins. The chest is full and rounded. The resonance on percussion is abnormally clear, and the inspiratory sound is scarcely audible and the expiratory prolonged; or the respiratory sounds, if there be more or less bronchitis, are masked by sibilant and sonorous rhonchi.

The dulness on percussion in the region of the heart is altogether absent or considerably diminished in extent; and the heart's sounds are very inaudible, and the pulsation feeble and visible over a large space in the left side of the epigastrium. The pulse at the wrist is also uniformly weak and often slow.

In the other or complicated form of the disease there are usually evidences of consolidation in some part of the chest, at the upper clavicular, dorsal or lateral regions; indicated by the usual signs, deficiency of resonance on percussion and of the respiratory movements and unduly loud cough and vocal resonance and tubular breathing. Sometimes the whole chest is contracted being narrow across, the supra clavicular spaces are depressed, and the liver and stomach advance to a high level from below. In this condition the resonance on percussion may be only slightly if at all impaired, but the movements of the chest are very imperfect, the vocal thrill is usually exaggerated, and the respiratory sounds are harsh. Large veins are also generally seen upon the surface of the chest.

In both forms of the disease the patients' strength becomes very much reduced, their complexion is very sallow, and they suffer from shortness and difficulty of breathing, much aggravated upon taking any active exercise or when suffering from cold. They have usually a hard cough, often with a husky or hoarse voice, and they expectorate a considerable quantity of secretion, which is generally described as of a deep brown colour. Their appetite is impaired, their food does not agree well with them and their bowels are confined. They often experience palpitation, and the sounds and action of the heart and the pulse at the wrist are very feeble.

The form of the disease in which there is local consolidation in some portion of the lungs, bears a close general resemblance to true consumption, and especially where, as often happens, the voice is husky and the patient expectorates blood. There are, however, features by which it is sufficiently distinguished from that disease. It usually occurs in persons who do not present any hereditary predisposition to phthisis—their parents and other relatives having often attained advanced ages and being quite healthy. It commences at a later period of life than phthisis, indeed in persons who have reached ages at which consumption is by no means of frequent occurrence. It is also much slower and less active in its progress, so that in persons who have been ill for several years the signs often do not indicate extensive or advanced disease. The quickness of pulse, the rapid and extreme emaciation, and the night perspirations so characteristic of true phthisis, are also generally absent or only slightly marked, and there is rarely diarrhœa, indeed the bowels are often obstinately confined.

The course and result of the two forms of miners' disease differ. When the affection takes the asthmatic form, though the patient continues always a great sufferer and unfit for any active occupation, life may be prolonged for many years. I met with instances in which the men stated that they had been in this state for several years, 7, 11 or 12, 20, and 25 or 26 years. Indeed this condition seems to be a kind of imperfect natural cure. Patients several times mentioned that many years before they had been very seriously ill so as to be compelled to give up work, and were stated by medical men to be running into rapid consumption. After having, however, completely laid by for some months, or a year or two, they rallied, and while suffering from symptoms of asthma, recovered a certain amount of vigour, and had continued much in the same state since.

In the form of disease in which portions of the lung become consolidated, the disease seems generally to progress, though slowly, and ultimately to determine some form of disorganization of the lungs. The signs of cavities develop themselves, indicating either considerable dilatation of the bronchial tubes or the occurrence of ulceration in the lung tissues, and the patient's power more rapidly breaks down, so that the affection usually terminates fatally at the most in 7 or 8 years.

The precise nature of these several forms of affection can only be ascertained by a series of post-mortem examinations, and I have had the opportunity of examining after death but one case of miners' disease. In that instance the affection seemed to have originated in bronchitis and pneumonia, leading to collapse or consolidation of the lung, and no tubercle was found in any part of the body. The patient was a man 55 years of age, who had been a miner since he was 13 or 14 years old; he had been laid by ill for three years, though ailing for a greater length of time.

The left lung was found slightly attached to the parietes by old cellular adhesions. It was voluminous, somewhat emphysematous at the edges, of a deep blue or black colour, and sparingly crepitant. The bronchial tubes contained much secretion of a dark brown colour. The right lung was universally attached to the parietes by strong fibro-cartilaginous adhesions. One of the ribs was carious, and an abscess had formed in the situation, containing thick yellow pus, which involved the pleura but not the lung itself. The substance of the lung was of the same colour as the left, and entirely solid except towards the upper part, where there were several irregularly shaped cavities, which, together with the bronchial tubes, contained a similar brown material to that found in the tubes of the left lung,

The bronchial glands were also very large, hard, and of a black colour. In the bronchus of the right lung, the terminal portion of that of the left, and the commencement of the trachea, the mucous membrane was deeply reddened and studded with small yellowish coloured deposits of lymph. The trachea and larynx were large, but the mucous membrane on the epiglottis and cordæ vocales, though thickened, was free from ulceration.

It will be seen from the tables in the appendix that this form of disease occurred, generally speaking, in persons of midddle age; of 39 patients examined, the mean age at the time was 47 years, and the extremes of age 25 and 63. The average duration of the disease was then four years, but there was a great variety in the cases in this respect, the periods having ranged from 1 year to 25 or 26. The ages at which the patients stated that they had first worked underground ranged from 7, 8, and 9, to 20 and 27 years, and their period of work prior to the occurrence of disease was, on an average of 36 cases, 27 years. From this calculation, however, three cases in which the patient had only worked one year, five years, and eight years, are excluded; and without these cases the periods of work ranged from 11 to 51 years.

Consumption.—Next in point of frequency among the diseases of the miners was tubercular consumption. Of this affection I met with 12 cases in which the disease was advanced, and three others in which it was only commencing. In five cases also classed under the head of miners' asthma, there were detected evidences of consolidation at the upper part of one or both lungs, which might have been tuberculous, but probably was the result of inflammatory action in impaired constitutions. As is usually the case, the instances of consumption which fell under my notice occurred most generally in persons who displayed some hereditary predisposition to the disease, other members of the same family and often persons who had not worked underground, having died of consumption.

The cases of consumption in miners did not differ from the disease as ordinarily seen, except that in some instances the affection occurred at ages at which, under favourable cir-

cumstances, the liability is comparatively small; the disease also was sometimes unusually prolonged. In other respects all the common characters of phthsis were observed—the quickness of pulse, the night perspirations, the tendency to diarrhœa, and the physical signs were those which are commonly detected. In one case the disease displayed a somewhat unusual complication, albuminuria and dropsy. The cases tabulated in the appendix illustrate the remarks here made. The mean age of the 12 patients was 35 years, and the ages ranged from 21 to 52. The duration of the disease averaged 9 to 10 months at the time the patients were examined, the extreme duration being four months and seven or eight years. The ages at which the patients had begun to work underground ranged from 9 or 10 to 21, and of 11 cases the period of work prior to the commencement of the symptoms was 20 years. The extreme periods of work were 14 and 41 years, exclusive of one case in which a person, always very delicate, had only worked five years.

There can be no doubt that the work in which the miners are engaged peculiarly predisposes them to suffer from affections of the chest; but the special form which these affections assume would appear to depend to a considerable extent upon the original constitutional power of the men, and especially upon the existence or absence of any hereditary predisposition to phthisis. When the miner is of healthy constitution, he resists to a much later period the unfavourable influences to which he is subjected, and the diseases which ultimately occur are asthma connected with gradual failure of the power of the heart and lungs, with or without chronic bronchitis; or inflammatory consolidation of some portion of the lungs, which may ultimately terminate in disorganization and ulceration of the tissue. When on the contrary the patient is originally of feeble constitutional power, and especially if predisposed to phthisis, he becomes an invalid at an earlier period, and suffers from true tubercular phthisis. In some cases, however, where the predisposition is only slight, the patient escapes the disease during the period of life in which the tendency is usually manifested, and only sinks under it when under more favourable circumstances he would probably have escaped it altogether.

A case of mesenteric disease, an affection also of tuberculous nature, in a boy 17 years of age, who had gone to work underground at 14 and had worked about a year and a half before his health failed, is also included among the cases examined.

4. *Diseases of the heart, &c.*—From the violent muscular exertion undergone by the miners, both when working underground and in ascending the ladders, I expected frequently to meet with affections of the heart among them, and such proved to be the case. The forms of disease which were observed were not, however, with one or two exceptions, such as are generally occasioned by any violent muscular exertion, as rupture or injury of the aortic valves. The prevalent form of cardiac defects appears indeed rather to be mitral valvular disease, resulting probably from dilatation of the left ventricle and consequent ill adjustment of the valves, so as to render them incompetent to close the orifice.

In four cases patients complained of palpitation of the heart, increased on exertion and incapacitating them from following their employment. In two of these the symptoms were first experienced after severe sprains, and some injury had probably been sustained by the heart, though no signs of valvular or other defect could be detected. In one of the two other cases the heart was apparently dilated, and in the fourth there were marked dyspeptic symptoms.

In four cases there were the usual symptoms and signs of more or less aggravated mitral valvular disease. In one of them the affection had supervened on acute rheumatism; in another the patient had had some pain, redness and swelling of the hands at the time the heart first became affected, which might have been rheumatic. The other cases had no connexion with rheumatism. The ages of the men who were thus affected were 21, 31, 36, and 36; they had first commenced working underground when 13, 15, 16, and 17 years of age respectively, and when examined they had been incapacitated from work for two and a half to three years, seven months, ten or eleven years, and four years.

In addition to these cases, there were others classed under the head of miners' asthma, in which palpitation was a predominant symptom, the heart was dilated, and the action of the mitral valves probably defective. Indeed it will be remembered that in that form of affection, shortness of breath and palpitation were common symptoms, even at an early period, and often existed to an extent altogether disproportionate to any signs of pulmonary disease which could be detected. They were therefore probably connected with some failure of muscular power and dilatation of the cavities of the heart. In the later or more advanced stages of miners' asthma there could be no doubt of the existence of dilatation of the right side of the heart, and the affection probably involved the left side also. The pulsation was generally visible over a large space in the præcordia and to the right of the left false ribs in the epigastrium; the impulse of the heart was feeble, the sounds indistinct, and the pulse at the wrist also weak.

In the only case of miners' disease which I had the opportunity of examining after death, the heart was found somewhat large, and weighed probably about 10½ oz. avoir. The cavities were dilated, but the walls not increased in thickness. The attached pericardium was loose and œdematous, and the muscular substance of the heart pale and flabby. The valves were healthy, but the aorta and pulmonary artery were both considerably dilated, though not otherwise diseased.

A case of aortic valvular disease was met with in a miner 51 years of age, who laboured also under hemiplegia. He stated that he had commenced to go underground at the age of 15, and had always worked in good air, having been employed as a "coacher," or in pushing the trucks along the tramways from the places where the men were getting the ore or driving levels to the shafts. The work was severe and he had been much exposed to cold draughts, but had never had any rheumatic symptoms. The date of the first occurrence of the cardiac symptoms could not be ascertained, but the first attack of paralysis had occurred five years before I saw him.

Another man, 44 years of age, laboured under symptoms of angina pectoris. He had first worked in a mine when 14 years old, and had chiefly been employed in damp shafts, repairing them when "forking out," or being pumped out to be re-worked after having been abandoned. He complained of suffering severe pain at the sternum and in the region of the heart, extending through to the left shoulder blade and down both upper arms especially the left. He was first attacked when walking to the mine one morning; and the pain had since continued to recur, especially on exertion, with such severity that he had been quite incapable of undertaking any employment whatever. It was accompanied by breathlessness, but was unattended by any sense of faintness or insensibility. It usually subsided in a few minutes if he immediately stood still when it came on; and under the rigid observance of rest and freedom from excitement had become less severe and of less frequent occurrence. On careful examination no signs of disease of the heart or aorta could be detected.

5. *Affections of the nervous system and organs of special sense.*—I have already mentioned that in the case of aortic valvular disease the patient had hemiplegia. He had had two attacks of paralysis; of which the first occurred five years before he was seen, since which time he had been unable to work. In the other case the patient had commencing miners' asthma. He was 69 years of age, had worked as a miner from the age of 10, and had been laid by with paralysis for eight and a half years.

In three cases the patients were paraplegic. In one of them a man 50 years of age, who had first worked in a mine at 17 or 18, had been laid by for one year and seven months with loss of power over the lower extremities, which came on after he had been working in cold water. In the second case the patient was 49 years of age; he had first gone underground at the age of 18, and had been paraplegic for six years. In this instance the power of speech was affected and the paralysis was becoming general. In the third case the paraplegia was less complete. It occurred in a man 44 years of age, and was ascribed to a fall in the mine from a height of 24 feet which had occurred seven months before.

I met also with a case of very marked paralysis agitans in a man 52 years of age, who had begun to work as a miner when nine years old, and laboured under very severe miners' asthma. He had been ill and unable to work for seven or eight years.

In addition, however, to these more serious affections, symptoms of nervous disorder are very often complained of by the miners. Deafness is extremely common, and frequently exists to a marked degree in men who have worked several years underground, and this too when they have never sustained any injury from blasts or other accident to which the condition could be assigned.

In the cases of slow fever, miners' asthma, and indeed in almost all the forms of affection to which the miners' are liable, the men very generally complain of suffering from headache, giddiness, noises in the ears, depression of spirits, &c., and these symptoms often exist to a very distressing extent.

6. *Dropsical affections.*—In one of the most marked cases of miners' asthma which was seen, the patient stated that when his asthmatic symptoms were more severe, as during winter or when he took additional cold, his feet and ankles became swollen. He was 49 years of age; had first begun to work as a miner when 14, and had been incapable of

going underground for 20 years, and quite unable to work for 7. In a case of mitral valvular disease in a miner 21 years of age, previously referred to, the lower extremities were œdematous. In three other instances there were also dropsical symptoms, doubtless due to cardiac and pulmonary obstructions. In two cases there was anasarca connected with renal disease. In one of them, a man 21 years of age, hereditarily predisposed to phthisis, laboured under advanced consumption with dropsy and albuminous urine. He had only worked underground for two years and a half. In the other case the man was 29 years of age, had worked as a miner since the age of 15 or 16, and had been in America, where he had drank much and contracted syphilis. In addition to these cases, a man 57 years of age, who was still working underground, stated that three years before he had suffered from a general swelling of all parts of the body. The affection came on after exposure to cold and damp, and was attended by pain in the loins and scanty and bloody urine, and was doubtless renal dropsy. He was laid by in consequence for three months and still suffered from weakness in the loins, though the anasarca had entirely disappeared.

In the fatal case of miners' disease the kidneys were found large and somewhat mottled and the cortical portion narrow, but the tumica propria separated readily and the organs did not appear to have undergone any organic change.

The miners might certainly be expected to suffer from renal affections subject as they are to be exposed to cold and damp, after they have been working hard in hot places and perspiring profusely, and they must be especially susceptible when exhausted by working in close places.

The dingy complexion of the men who have long worked underground, and especially of those who suffer from miners' asthma, is very striking, and though occasionally partly due to affection of the liver, is, in many cases altogether disproportionate to any bilious tinging of the conjunctivæ which may exist. Indeed some of the men who present the sallowness in the most marked degree have peculiarly pale and glassy eyes. I was therefore led to suspect that the sallowness might have some connection with the condition of the supra-renal capsules, and the state of those bodies was carefully investigated in the case of miners' disease which was examined after death. One of the capsules was found extremely atrophied, so that it seemed little more than a mass of condensed cellular tissue. The structure of the other was wholly destroyed, and its substance was converted into a cyst with extremely thin parietes. It remains to be ascertained whether the existence of the disorganization of the supra-renal bodies in this case was merely an accidental coincidence, or whether a similar condition is of frequent occurrence in the miners who present the peculiar dinginess of complexion which has been described.

7. *Diseases of the skin, scrofula, &c.*—The only important skin affections which were noticed were two cases of lepra or psoriasis. The subject of one of these was a man 38 years of age; the other was a boy of about 14. Neither presented any peculiar features. Some of the children had also impetiginous eruptions about the face.

Though both among the men and boys enlargement of the cervical glands and the cicatrices of abscesses were occasionally observed, such were not of by any means of frequent occurrence, and in most cases the affection was stated to have commenced before the subjects went to work underground. Several of the men were much marked with smallpox.

8. The two remaining cases included in the tabular statement of the diseases of the miners were the *results of injuries* which had in each instance been sustained three years before the men were seen. In one case the man was crushed by a fall of stone, and had suffered from shortness of breath and palpitation ever since. In the other intance the man had had his leg broken, and had otherwise been much bruised and shaken. Neither of them had been able to do any work since the occurrence of the accidents.

In several cases the men were found to have sustained more or less serious injuries of the eyes and face in blasting, and several were nearly or quite blind of one eye from this cause.

A large number of the men examined also stated that they had sustained more or less serious injuries and accidents, falls from the ladders, crushes, &c. In some instances also it appeared that accidents of comparatively slight description had, doubtless from the state of health of the miners at the time, been attended with serious symptoms that entailed very prolonged periods of absence from work.

After the evidence which has been advanced as to the sanitary state of the mining population and the enumeration of the various forms of disease met with among the miners, it remains to inquire what are the causes which conduce to their unhealthy condition.

Causes of Disease among the Miners.

Predisposing causes.—Construction of dwellings, drainage, &c.—There can be no doubt that the county of Cornwall is eminently healthy, and there is nothing about the meteorological or geological features of the mining districts which can act unfavourably upon the sanitary condition of the mining population.

In the Camborne and Redruth districts the modern cottages are generally well and substantially built, and are very much better than those inhabited by the agricultural labourers in the midland counties. They contain generally 2 or 3 or 4 or 6 rooms; in the former case being only occupied by one, in the latter by two families. They have usually a small plot of ground in front or behind in which vegetables, potatoes, are cultivated. They are stated, however, not to be generally provided with any system of under-drainage, and the lower rooms have rough cast or concrete floors, so that they must be damp. The upper rooms are also not usually ceiled but open directly to the slated roof, and must be hot in summer and cold in winter. With these exceptions, however, and the want of a larger number of rooms for the separation of the different members of the families, the cottages inhabited by the better class of workmen are exceedingly good. Some of the cottages are, however, the reverse. They are thatched, and consist of only two rooms, the upper one in the slanting roof; and they are not provided with any system of under-drainage and many of them have no privies. This was the case with the house in which Mr. Bankart and myself performed the post mortem examination on John Francis, and in several of those adjoining; and I was informed that many others in Redruth are similarly circumstanced. In Camborne I was taken to a row of thatched cottages, each consisting of only two dark and low rooms, and all of which had no privies and no system of drainage whatever, the inmates throwing everything either into a small back yard or on a common dust heap in the street.

There can be no doubt that this state of things must exercise a very deleterious influence over the whole population. I learn from the resident medical men, that typhoid fever, the unmistakable indication of defective drainage, prevails not unfrequently in the district. Were it not for the general healthiness of the climate and locality, the free exposure from the absence of any high hills to the winds blowing from every quarter, the great facilities for natural drainage afforded by the rocky character of the surface, and the great fall of rain, typhoid fever would certainly prevail extensively.

In other parts of the mining districts, I found the condition of the cottages most defective. At Wendron, they consisted of low buildings with thatched roofs containing 2 rooms. In one which I visited, there were three beds in a small room up stairs, without any window which admitted of being opened. In this room there was a father who was ill and a wife with a little baby in one bed, a married daughter and a baby in the second bed, and the rest of the family consisted of the son-in-law, a daughter about 16, and two sons of 14 and 12. In none of these cottages was there any drainage or privies. The cottages in the St. Just district were also generally most defective. They were small, low, and thatched; contained only two rooms for large families, and the little windows which were provided in the sleeping rooms would rarely open. The floors were of concrete, and there was no underdrainage and rarely any privy, the whole refuse being thrown out on a dust heap in front of the door or into a pool of dirty green water, through which it was necessary often to pick the way to reach the door. This district is elevated and perfectly open to the sea and should be most healthy; but from neglect of all attention to sanitary regulations, at the time of my visit in August, it was suffering from typhoid fever, and I was informed by Mr. Searle, who obligingly took me to several of the cottages, that the disease had been prevailing extensively and fatally for several months.

The defective construction and drainage of the cottages cannot, however, afford any explanation of the condition of the miners, for they are less exposed to such injurious influences than the other members of their families.

The *diet and habits* of the miners have been blamed as causes of their unhealthy state. They usually live upon bread and butter and a kind of pie, the pasty, which they take down with them into the mines. This consists of a paste of flour and water and suet, with a small quantity of meat—fresh meat or pork, and potatoes and other vegetables. It is both an innutritious and indigestible article of food, and may in some degree explain the frequency with which the miners suffer from dyspeptic symptoms, and be connected with the occurrence of the skin affections, lepra or psoriasis, of which diseases cases were met with. There is great reason to believe

that the men, for persons who are engaged in a laborious and exhausting occupation, do not get a sufficiency of nutritious food, more particularly fresh butcher's meat. The miners are, as has been before said, very thin, sallow, and ill nourished, and for men engaged in athletic pursuits are not generally very muscular; and, though their condition may be in part ascribed to the profuse perspiration when they are working in the mines, the deficiency in the quantity of nutritious food is probably influential in its production. It was not easy to ascertain the precise quantity of butcher's meat which enters into the diet of the men, but I met with no one who stated that he got more than half a pound of uncooked meat in a day, and they assert that they only obtain this amount of fresh meat very occasionally. The irregularity with which they get their meals was assigned by one man as a cause of the indisposition under which he laboured.

I have been informed that the men indulge too largely in beer; and this may possibly be the case on the pay days; for the practice of paying in notes, adopted in some instances, almost necessarily drives the men to the public house to get the notes cashed. I however made frequent inquiries of the men working in different districts and of the overseers, and, if not entirely misinformed, conclude that the Cornish miners are not an intemperate race of men, at least when compared with the working population of London and other large towns. I was assured that they rarely drink spirits. I cannot think that their habits in this respect can be blamed as the cause of their unfavourable sanitary condition. The men are also said to be much addicted to smoking, and they excuse this habit with the assertion that it is necessary to smoke in the mine to avoid the injurious effect of the air and of the smoke of the blasting powder. The practice is certainly very objectionable. Other causes which may be blamed for the state of the miners are the absence of fresh air and sun light, the breathing of a deleterious atmosphere, the inhalation of gritty particles, the heat of some of the workings, the violent muscular exertion, and the exposure to sudden chills after working in the mine or on coming to the surface.

Absence of Sunlight, &c.—At all seasons of the year some of the men must be very little exposed to sun light and fresh air. Working as they do in spells of 8 hours, they must even in summer be much in the dark, and in winter can scarcely have any sunlight at all. This will go far to explain the peculiar blanched appearance, the glassy eyes, and pale lips which are constant among the miners, and even in the men who regard themselves as in robust health. This is the more striking from the peculiarly fresh complexions and the healthy appearance of the other portions of the population of the same district. By the politeness of the Rev. Mr. Ellis, I visited, in conjunction with Mr. Temple, the National Schools at Pool, which are attended by a large proportion of miners' children. On the day of our visit, Monday, the attendance was smaller than usual, but in the female school we found 46 infants and 82 girls, and in the boys' school 140 boys; and I have certainly never seen a more healthy set of children collected together. I did not, on close inspection, detect a child with swelled glands or other signs of scrofula, and was informed on inquiry that such were very rare. The older children also, both boys and girls, who are seen working at the surface in dressing the ores, are usually very healthy looking; and the young women who are employed in breaking the ore and picking it before it is crushed and dressed, have remarkably clear, bright, healthy complexions. The married women who are seen in the cottages are also very healthy looking. No contrast can indeed be more striking than that which is presented by the children employed at the surface and those who work in the mines; and the men often have the appearance of being thoroughly worn out and decrepit when their wives, at about the same age, are healthy and young looking.

Deleterious influence of the air of the Mines.—There can be no doubt that the air of the mines, especially in the deeper workings, and at considerable distances from the shafts, becomes extremely impure from the very imperfect ventilation, the deteriorating influence of the respiration of the men at work, and the combustion of the candles which they burn. This cause seems indeed to be by far the most important in determining the unhealthy condition of the miners. The ventilation generally becomes more difficult and defective with the increasing depth of the mines, and the state of the miners is therefore usually found most unsatisfactory in the districts where the mines have attained the greatest depth. The ventilation is, however, most seriously interfered with by the distance of the levels from a shaft, and several of the men complained much of the character of the air which they had breathed in workings which were very near the surface.

Of 45 cases in which the men who were examined assigned specific causes for the failure of their health, in no less than 16 they traced their indisposition to having worked in places where the air was "dead," "bad," "thin," "light," or "poor," as they variously described it, alone or in conjunction with other causes. The miners, however, do not usually speak of the breathing of bad air as directly occasioning the illnesses under which they labour. On the contrary they regard this, and doubtless correctly, as impairing their power and giving rise to a state of general weakness in which they become susceptible to any other morbific influences, and often suffer severely and for a long period from indisposition occasioned by some very trivial exciting cause.

Most persons with whom I conversed on the subject, the miners themselves, the underground captains, and indeed almost every one who had ever worked underground, admitted the frequency with which the air of the mines was impure. I was often told that "all men who went underground had to breathe bad air more or less," and the tables in the appendix afford ample confirmation of the correctness of this assertion. Of 54 out of the 63 fully reported cases of disease amongst the miners, in which the character of the air in which the men had worked is stated, in 38 the men reported that at various times they had worked in bad air; of the remaining 16, 3 stated that the air in which they had worked had never been particularly bad, 8 that it was generally good, and 5 only said that they had always worked in good air. It is possible that had fuller inquiries been instituted the proportion of cases in which the air was defective would have proved to be much greater than this. Of 22 men whom I questioned on the subject, who were still working in mines in the neighbourhood of Liskeard, not less than 18 complained of the character of the air in which they worked.

When not at any great depth and not far removed from a shaft, there is often a very ample supply of fresh air, indeed the men not unfrequently complain of suffering from the draughts of cold air in the shafts and levels; but, when working at a close end driving a level, or getting the "stuff;" or when engaged in sinking a "winze," or cutting a "rise," or driving crosscuts so as to open up the different levels, the men state that the air is often very "dead" or "bad." In such cases they say that their candles cannot be got to burn, except when the wicks are constantly teazed out, or when they are held on one side. Sometimes they stated that the candles could not be got to burn at all, so that they required to be placed some distance behind the part at which the men were at work. In other cases the men said that even lucifers if struck would not set fire to the wood; and more than one miner told me that on going to his work in the morning at a close end, a long way from the shaft, they often could not get their candles to burn at all, and had to take off their coats and beat them about so as to create some little current of air, before the candles could be lighted.

That these statements were not overdrawn I had personal proof in Dolcoath mine, otherwise extremely well ventilated, for in one part where some men were at work sinking a "winze," at about 40 fathoms from the shaft and 190 from the adit, two candles were found burning very badly, and one actually went out while we were looking down.

The work of the kind which has been referred to is chiefly done by "tutwork," and accordingly it is the tutworkers who suffer most from mining. The following amongst others affords a striking instance of the injurious effects of the air which this class of men often have to work in. A man 33 years of age, who had first gone underground when 14 years old, stated that he had been quite well till he worked in a close end, in which the air was so bad that the candles could scarcely be got to burn; the level was 160 fathoms from surface, and the mine was also cold and very wet. Four other men were employed in the same place. All the others were repeatedly laid by; but he continued the work for three months when he became seriously ill, and, though five months had elapsed when I saw him, he had never been well since. Another of the men was also laid by ill at the same time.

The quantity of unconsumed carbonaceous material thrown off by the candles, especially when burning so imperfectly as they are reported to do, and the gases and smoke from the explosion of gunpowder, must further tend to render the air of the mines injurious. The very small movement of air is also attested by what the men very frequently complain of, the slowness with which the smoke from the blastings clears off, or as they term it the length of time which "it lies in the mine."

The excessive prostration of strength, altogether disproportionate to any evidences of actual disease which can be detected, and the affection described by the men as "slow fever" are precisely the forms of indisposition which would *à priori* be expected to be occasioned by slow poisoning from

the continued breathing of very impure air. The asthmatic symptoms also which seem to result from gradual failure of power in the lungs and heart may also be in part fairly referred to the same cause. The frequency of dyspeptic symptoms among the miners is doubtless also in some degree to be ascribed to the impure air which they breathe. Several of the men mentioned that after having been working in very close places for some time, their appetite failed and the food which they took did not agree with them and they became subject to severe pains in the stomach and bowels and sickness, with obstinate constipation or diarrhœa. In the cases of severe dyspepsia or organic disease of the stomach, the patients said that the symptoms had first commenced after they had been working in poor or bad air. Vertigo, headache and other nervous symptoms, with general failure of power, first experienced in the arms and legs in beating the borer and in ascending ladders, with palpitation and shortness of breath, were equally referred to the same cause.

The older men, however, frequently stated that the ventilation of the mines was very much better at the present time than formerly.

Inhalation of gritty particles.—If also the men inhale the smaller particles of granite and other hard and gritty earthy matters which are thrown off from the rock by their tools, such must certainly be serious sources of irritation to the delicate structure of the laryngeal and bronchial mucous membrane and to the substance of the lungs. Several of the men complained of the dryness and dustiness of the mines in which they worked, and one man said that "the dust was far worse than anything else" they had to contend with. So far, however, as I was able to judge I should doubt whether this cause generally acts very unfavourably upon the men, or at least whether it is comparable in its effects to other injurious influences. Portions of the lung of John Francis were subjected to careful chemical analysis by Dr. Bernays, and no siliceous material was detected in them. In the French millstone makers, to whose peculiar condition I have elsewhere drawn attention, there can be no doubt that the sharp particles of siliceous matter which they inhale do find their way into the lungs and become sources of serious irritation; determining, in persons of healthy constitution, broncho-pneumonic attacks which may ultimately lead to disorganization of the lungs, or in persons predisposed to consumption, true tubercular phthisis. The Cornish miners, however, probably like the gunflint makers of Meunes in France, suffer more from the impure air which they breathe than from the inhalation of particles of stone.

Dr. Bernays found that the dark material, contained in large quantity in the lung of John Francis was carbon.

High temperature of some mines.—The great heat of some of the Cornish mines, and, according to the men, especially of those in the killas or clay slate, must also injuriously affect the men who work in them; both directly by exhausting their powers, and indirectly by rendering them unduly susceptible to the influence of cold, to which they may be exposed in other parts of the mine or at the surface.

Some of the workings in the mines are so extremely hot that the men stated that they could not remain in them for many minutes together, but required to go into colder places and bathe in cold water to cool themselves. In these levels the men work with very little clothing on them; some men told me that they wore only their boots and a "dickie" or flannel shirt, others that they worked quite naked; all stated that in such places they were greatly exhausted even by very short periods of work. They especially complained of some of the mines, which were both hot, dry, and dusty. In 5 cases of disease among the miners, the heat of the mines was assigned by the men as the cause of their impaired health.

Violent muscular exertion.—The violent muscular exertion which is undergone by the men when working below, beating the borer or pushing the trucks along the tramways in the levels, or in ascending from the levels to the surface by the ladders where a man-engine or skip is not provided, must also tend much and prematurely to exhaust the powers of the workmen. The operation of beating the borer is generally performed by two men, who strike and hold alternately. Sometimes by three, or by two men and a boy, the former striking while the latter holds. The hammer which is employed is heavy and the strokes are delivered as rapidly as possible. In hot places the men can only make a few strokes in succession without stopping to rest, and under any circumstances they are soon put out of breath and are much fatigued by the work. One man who laboured under palpitation stated that he first suffered when engaged in beating the borer, and the heart had doubtless sustained some injury though no signs of valvular defect could be detected. Sometimes also the men have to work in very constrained positions, and one of them ascribed his illness to having worked in a nearly upright pitch. The work is also objectionable, as calling into action chiefly the muscles of the arms, not those of the whole body.

The men who are employed in pushing the trucks along the tramways, "tramming" or "coaching," have more general exertion, and the labour is more severe; and I have referred to a case in which the aortic valves were probably injured by violent exertion in this way. These men have, however, the advantage of working in good air, though they are much exposed to cold draughts and wet in the levels.

The labour of ascending the ladders, especially when the men have to work at great depths, 100 to 200 fathoms or more, is very severe, and occasions, even in young and active and robust men, great breathlessness, palpitation and quickness of pulse, followed by exhaustion, and especially when the men have been working their full spell in a hot place and perhaps in bad air. The captains state that the younger men are in the practice of racing up the ladders trying who can reach the surface in the shortest time, and assign the breathlessness of the men to this cause. There is, however, no doubt that when an ample amount of time is allowed for the men to come up they are very greatly exhausted by the exertion. On reaching the surface they gasp for breath, cannot speak, and have a palpitating heart and quick pulse. After a short time in robust and healthy persons these symptoms subside, and the pulse is feeble and occasionally slow. In men who are ailing and weak and verging towards old age, the exhaustion and distress occasioned by ascending the ladders by no means so readily subsides; and I met with several miners, working in mines where man-engines were provided, who stated that they would be quite incapable of going underground were they compelled to make use of the ladders.

The violent muscular exertion thus made by the miners are I believe, mainly the cause of the feebleness of the pulse at the wrist, which is so generally a noticeable peculiarity among them, and especially in the men who have attained or passed middle life. The imperfect respiration while beating the borer or ascending the ladders, causes primarily engorgement of the right side of the heart and subsequently of the left side also. This condition, at first only temporary, with the constant repetition of the same causes, comes with the progress of life to be permanent, or in other words gives rise to dilatation of the cardiac cavities. In men employed in athletic pursuits, if they live on the surface and have a sufficiency of nutritious food—as smiths, strikers, &c., the heart generally becomes hypertrophoid and the pulse at the wrist is consequently full and strong. Nothing therefore struck me more forcibly than to find in the miners so frequently the signs of dilatation of the heart—a condition the very opposite of that generally presented by persons following similar laborious occupations.

It has been already stated that the mitral valvular defect which is so common amongst the miners, results apparently from dilatation of the left ventricle; not, as is most generally the case, from disease of the valves originating in rheumatism. I met with only one case of mitral valvular disease which had supervened on acute rheumatism, though it was possible that some slight rheumatic symptoms might have accompanied the commencement of the cardiac disease in a second instance.

It has already been mentioned that only a small number of the miners ascribed the immediate occurrence of their illnesses to the direct effect of bad air, and the same remark applies to the violent muscular exertion which the men undergo; indeed both these causes rather act as predisponents to disease than directly give rise to it. The men often said that they "were worn out by hard work and going underground," and there can be no doubt that the impairment of their health is due to the operation of several causes, of which these two may be regarded as the chief. The men when thus predisposed readily suffer from severe and prolonged attacks of illness on the operation of any of the ordinary exciting causes, often when such are too slight to have seriously affected healthy persons.

I may here remark upon another cause of undue exhaustion of the men in some districts, the distances to which they have frequently to walk to and from the mine. In the Wendron district some of the men said they had to walk several miles in consequence of being incapable of obtaining cottages in the neighbourhood of the mines at which they worked.

Exciting causes.

Cold, damp, &c.—The foul air of the mines, and the violent muscular exertion which the men undergo, may immediately give rise to disease; but the cause most frequently assigned by the men as having occasioned their ailments was cold, taken either in the mine or at the surface. A large proportion of the cases of asthma, both simple and complicated, and several of the cases of consumption and other forms of disease, were stated to have commenced with symptoms of cold and after the miner had been chilled.

Some of the men ascribed their illness to the exposure to "cold damp" in the mine, others to having been chilled on resting in a cold and damp level after they had been working in a hot and close end and perspiring freely, and yet others to their having had to pass through cold water on leaving the place at which they had been working. Some blamed as the cause of their indisposition the cold draughts to which they were exposed in the shafts when wearing their wet underground clothing. Another said he had taken cold from having to wait in the shaft till the expiration of the time for leaving the mine. One traced his attack to exposure to cold and damp on reaching the surface from having to go through the rain to the changing house, another to having had to wash in cold water, and yet others to having put on the clothes in which they had walked through the rain to the mine, and which had not been properly dried.

One man ascribed the failure of his health to having gone to work in a cold mine in the granite after having long worked in a warm one in the killas; another, who suffered from symptoms of angina pectoris, referred his indisposition to having been employed in repairing the shaft of a mine which had been abandoned, and was being reworked, "forked out," and in which the cold water came down upon them and kept them constantly wet. A third, who was paraplegic, said that the symptoms had rapidly come on after he had been working with his legs in cold water, owing to the drainage of the level being obstructed by "attles" or "deads." And a fourth referred his illness to having taken cold from having been employed in repairing the neck of the shaft, when he was accustomed to working in warm levels underground.

The cold and damp to which the men are in various ways exposed, especially the continued working with the feet in cold water, explains the frequency of rheumatic affections among the miners; and it is evident that the warmth of some of the workings and the impurity of the air in others must render the men extremely susceptible to suffer from these causes.

Effects of dressing the ores and other work performed at the surface.

It does not appear that the operations performed at the surface of the mines, the breaking of the ores and dressing, &c., are injurious to the work people employed in them. Indeed, as a general rule, the men who work at the shafts and at the dressing floors, form in their appearance of health and vigour, striking contrasts to the underground miners. At all the mines men are met with who have formerly worked underground, and have given up in consequence of the failure of their health. They not unfrequently state that at the time they ceased working as miners they were thought to be going rapidly into consumption or into the miner's complaint, and that for some months or even one or two years or more, they were incapable of doing any work, that they then got better and were able to do some light work, and are now perhaps quite well or tolerably robust for their age. It thus appears that the surface work acts as a restorative upon the men who have suffered from going underground. Indeed, there is nothing which seems likely to be injurious except the process of roasting to expel the arsenic from the tin ores, and this process is not required to be followed with all the ores.

When the ores require to be exposed to heat for this purpose, it is done in a furnace communicating with long flues, in which the sublimed arsenious acid condenses, and these flues require to be emptied at intervals.

The men who are employed in removing the arsenic from the flues state that they suffer occasionally from eruptions on the skin and pains at the chest and in the stomach and spitting, and that any abrasions or cuts are apt to fester, but I did not in any case hear of more serious effects. In the furnace rooms the smell of the arsenic and the fumes are often very distinct from the feeding of the furnace being carelessly performed, but I did not learn on inquiry that injurious effects resulted to the persons engaged in the work. A man came under my notice who had been employed in preparing pure arsenious acid from the crude arsenic, and who had apparently been much exposed to suffer, but he only stated that he had experienced the symptoms which have been mentioned. One man, aged 45, who laboured under consumption, who had formerly been a miner and had for some years worked at the dressing floors, stated that he thought his illness was caused by the arsenic he had been in the habit of working in, but he did not mention any symptoms which pointed to his having really suffered from the influence of arsenic. The water in the workings of some mines is said to contain arsenic and sulphur derived from the decomposition of the arsenical pyrites which exist in the tin and copper ores; and this "mundic water," as it is termed by the miners, produces irritation and festering if applied to cuts or abrasions.

The young women who are employed in breaking the ores and tending the dressing floors, did not appear to suffer from their occupations, though some of them from about 16 to 20 were chlorotic looking. The proportion of these was, however, probably not greater than it would be among the same number of young women employed in any open air occupation, and was certainly less than in persons leading sedentary lives and residing in towns. Indeed, as a general remark, they were remarkably healthy looking and had fresh florid complexions.

The children, both boys and girls, employed at the dressing floors were generally remarkably healthy in appearance.

Suggestions.

It is scarcely my place to comment upon the management of the mines, but I venture to offer the following suggestions as to matters bearing upon the health of the miners.

1st. That in some districts there is a great want of cottage accommodation in the immediate neighbourhood of the mines, and the cottages which do exist are of the most defective construction, so as to be objectionable both in a sanitary and moral point of view. It is also very desirable that the cottages should have plots of ground attached to them for the cultivation of vegetables, so as not only to aid the miners in producing the necessaries of life, but to furnish them with out of doors occupation during their leisure time. This would render them less susceptible to the injurious influences which operate upon them when underground. We were informed that in the St. Ives district the miners work in the market gardens and assist in landing and preparing the fish, and these occupations are doubtless very beneficial to them.

2nd. That some means should be provided in all mines to convey the men to and from their work underground, in the place of the ladders, which are the all but universal mode employed in Cornwall at the present time. Perhaps on the score of health the skip would be preferable to the man engine, as it would enable the men to pass more rapidly through the cold and draughty shafts, and so render them less likely to take cold in coming to the surface in their mining clothes, after having worked hard below and especially in hot and close places.

3rd. That, if possible, the ventilation of the mines should be improved, and means provided to secure the passage of a current of air, derived directly from the surface and not from other parts of the mines, through all the workings. It is well known that respiration and combustion deteriorate the air to a much larger extent than by the removal of the oxygen consumed, and it is essential to the maintenance of a pure atmosphere and to the levels being kept cool, that a large change of air should be obtained.

4th. That stringent regulations should be enforced to prevent the ventilation and drainage of the mines being interfered with by the accumulation of "deads" or refuse in the workings; such accumulations must materially increase the injurious influences which operate upon the miners.

5th. That the openings of the shafts used for footways should be covered in, and the changing houses situated in connection with them, or at least immediately adjacent to them. I visited mines in which the shafts in very exposed situations were entirely uncovered, and where the changing houses were at great distances from some of the shafts.

6th. That the changing houses should be sufficiently large to afford full accommodation for the whole of the men who have to make use of them; they should be provided with space for drying all the clothes, and with a sufficient supply of warm water to allow the men to wash thoroughly, and even to bathe themselves. In one of the mines visited, the changing house was much too small for the number of men; and from the reports of the men it appears that the supply of water is not always sufficient, and sometimes it is not warmed; and as far as I know in no mine are baths provided. I have also been told that the space for drying is not always sufficient, and that consequently the men on returning from below have sometimes to put on their clothes still wet.

7th. That boys should not be allowed to commence working underground at so early an age as at present. In some of the mines visited the proportion of young boys was large, and both the boys and men questioned often stated that they had commenced working underground at very early ages, 7, 8, 9, 10, 11, and 12. It will be seen from the tables in the Appendix, that of the men examined, 3 stated that they began to work in the mines when 7 years of age, 10 at 8, and 27 at 9 years of age; and not less than 185 or 39·8 per cent. between the

ages of 10 and 13 inclusive; altogether 225 or 48·4 per cent. began to work underground before the age of 14. Of the whole number of men found at work 117 or 25·2 per cent. were only 20 years of age and under. All experience shows that when persons in early life are exposed to injurious influences they suffer from them more severely, and earlier fall under their influence, than if they had attained a more advanced age and greater constitutional vigour. The boys employed in the mines form no exception to this rule, and no greater contrast can be presented than that between the boys working at the surface of the mines, and those at about the same age working underground, and this too when the period during which the latter have been in the mine is only very short. I frequently asked the miners what they thought was the effect of going underground upon boys in early life, and was uniformly told that if they went too young they could not long stand the work. I was also, however, told that if they did not begin mining as boys they never became good workmen. It is generally said that the boys only do "boys' work," but some of the men told me that what was so named was really harder work than that of the men themselves. It is, however, probably the air of the mines which is chiefly injurious, and to this the boys are just as much exposed as the men. If the boys were not allowed to go down before at least 15 or 16 they would probably have attained sufficient vigour to bear up against the injurious influences, and be quite young enough to become efficient workmen.

8th. The processes of breaking the ore and of dressing, in which young women and children are employed, are often carried on entirely in the open air. This may be more conducive to health than otherwise in warm and dry weather, but when it is cold and damp some protection should be provided.

Some of the children employed in these processes are very young, and must be taken from school before their education can properly have commenced. It would be desirable that regulations should be enforced to require a portion of the day, or certain days, to be devoted to attendance at school in the children under a fixed age.

9th. I cannot but think the system of giving pecuniary and medical relief to the men in cases of accident and illness is open to very grave objections. I was told that the relief furnished from the fund stopped out of the men's wages, was only given to the men when suffering from accidents, and that in some mines the medical relief was similarly limited to cases of accidents. The general rule I believe is that medical attendance is provided by the mine both in sickness and accident. In any occupation so injurious to the health of the work people as mining unquestionably is, the claims of the men for pecuniary as well as medical relief are quite as great in sickness as in accident, provided that the sickness results from the work in the mines, and some arrangement should be made by which the men can be equally assisted in both cases.

It struck me also that in districts where there are several medical men engaged in practice, it would be preferable, instead of certain medical men being appointed to particular mines, if the men were left at liberty to employ whatever medical man they chose; he being remunerated at a certain fixed rate from the mine fund. I should be very far from wishing to be understood to express any doubt that the medical men attached to the mines as at present do not zealously and efficiently perform their duty to the men; but I feel sure from remarks made to me by the men, that it would be more satisfactory to them; and to the medical men and the adventurers the change could make no difference. I have been informed that in certain districts an arrangement of this kind exists and is found to work satisfactorily.

10th. Taking into consideration also the early age at which many of the miners become incapacitated, either for work entirely, or for going underground and so obtaining sufficient to maintain themselves and their families, it has occurred to me whether some fund could not be formed in connexion with the mines by which the men should be allowed small pensions in cases of failure of health, after having worked in the same mine for a certain number of years.

At present it is a frequent ground of complaint on the part of the managers and the captains, that the men cannot be got to work long in the same place and are constantly changing from mine to mine. The plan suggested would probably go far to prevent the tendency to change and to keep the men steadily working at the same mines. Certainly it is a very discouraging prospect before a man, that though engaged in a dangerous occupation and likely to be prematurely worn out, he has little chance of obtaining the means of maintaining himself when no longer able to work, and is likely ultimately to come upon the parish.

TABLE of CASES of DISEASE among the MINERS examined in July and August 1862.

	Cases	
Dyspepsia or organic disease of stomach	3	
Rheumatism	1	
Slow fever	2	
Convalescence from fever or inflammation of the lungs	1	
Diseases of respiratory organs:		
Miner's asthma	41	54

* Dyspeptic and rheumatic symptoms, cough, expectoration, difficulty of breathing, palpitation, &c., with more or less marked general appearance of debility or indisposition.

CASE of MINERS' DISEASE examined after DEATH.

John Francis, at 55, under the care of Henry Harris, of Redruth.

He was reported to have worked underground at various mines, Carn Brea, Wheal Bassett, Wheal Buller, Tin Croft, and East Pool, and commenced working when 13 or 14 years of age. At first he did boys'-work, assisting the men, rolling the trucks underground, &c. After he did full men's work he had chiefly been employed at tutwork. His illness was ascribed by his friends to his having worked in damp and wet places and in bad air.

For five years before his death he had been out of health, suffering from difficulty of breathing, cough, and expectoration, and pains in the chest. He continued to work at the mines for three years after these symptoms first appeared, but for two years he had not been able to go underground, and had been employed in a drying room attending to the men's clothes. Latterly he complained of pain in his right side, which prevented his lying on that side, and he had also a swelling of the right thigh. He generally expectorated white matter, but had brought up blood.

His father was a miner, and died of "miners' disorder" after an illness of two years' duration, when 67 years of age. His mother died at the age of 60 of stricture of the œsophagus. He never had any brothers, but had three sisters, of whom one died at 63 of consumption; the other two are alive at 60 and 68 years of age.

He was not a very steady man, having been addicted to drinking. For these particulars I am chiefly indebted to Mr. Harris.

The post mortem examination was performed by Mr. Bankart and myself, about 24 hours after death.

The body was moderately emaciated. The left lung was voluminous, perfectly black on the surface, and adhered by old attachments in the mammary region, and the pleura in the seat of the adhesions was thick, white, and solid. The substance of the lung was very sparingly crepitant, and of a deep blue or black colour. It did not contain any tubercles; a peculiar brown coloured secretion was found in the smaller bronchial tubes. The edges of the lung in front were somewhat emphysematous. The right lung was universally adhered to the parietes by firm fibro-cartilaginous attachments. The third rib was carious, and an abscess existed in that situation which presented externally, and had separated the rib from the pleura. The abscess contained a considerable quantity of thick yellow pus mixed with cheesy matter.

The right lung was of a deep blue colour, and solid everywhere except at the upper part, where there existed several irregular cavities containing brown coloured fluid similar to that found in the bronchial tubes of the left lung. The bronchial glands were large, very solid, and of a deep black colour.

The trachea was considerably wider than natural, but the larynx was free from ulceration. Shortly above the bifurcation of the bronchi, and at the bifurcation and for a short distance along the right bronchus, the mucous membrane was studded with small specks of yellow-coloured lymph. Under these the mucous membrane was not abraded or otherwise altered.

The heart was of large size, and probably weighed from 10 to 10½ oz. avoird. The pericardium was somewhat loose, the cavities large, and the walls moderately thick and flaccid, and the whole organ appeared as if atrophied. The valves were dyed by blood from decomposition, but free from disease. The aorta and pulmonary arteries were both very considerably dilated, but the coats were of natural thickness and free from deposit.

The liver was partially attached to the diaphragm by old cellular adhesions, and its structure was dense, coarse and resistant.

The kidneys were easily deprived of their tunics, and the surfaces of the organs when exposed were smooth. The cortical portion was rather narrow; one of the supra-renal capsules was so completely atrophied as to consist of little more than cellular tissue. The other was converted into a mere cyst with thin walls and with a rough and dark surface in the interior.

The stomach was healthy, and the intestines apparently free from any disease.

The brain was not examined.

Note on the fever cases visited at St. Just with Mr. Searle.

The epidemic commenced in the spring in cottages surrounding the church, the churchyard being raised several feet above the adjacent ground. From this part the disease spread from cottage to cottage up the valley for upwards of a mile. The disease had the characteristic symptoms of typhoid-diarrhœa, tympanitic distension of the abdomen, &c., and Mr. Searle in all five lost patients.

In one case a young woman who was ill near the church, was visited by her sweetheart, who took the disease though residing in an entirely different district. The same young woman was nursed by a sister who came from a cottage about a mile distant, after about a fortnight she became ill, went to her own house, and spread the disease to others there, though no case had previously occurred.

The epidemic had to a considerable extent subsided when I was there; but Mr. Searle took me to two cottages forming one block of building in which there were still cases.

These cottages were situated on an open moor 200 or 300 feet above the sea, exposed in every direction, with a dry, shallow and rocky soil covered with heather, the sea being about 2 miles from it.

In point of situation nothing could have been healthier, yet the state of the cottages was most wretched. They were surrounded by shallow pools of water, covered with green slime, were not provided with any under-drainage or with privies, and all the refuse was thrown out on dust heaps situated in front of the doors and on the south sides of the cottages. One of the cottages was inhabited by a butcher who killed his meat on the spot.

The cottages were built of rough stone and covered with the heavy slabs which are obtained in the district; they consisted of three rooms each, one below and two above, and each had a small window opening N. and S. The floors of the lower rooms were on the level of the adjacent soil, and were paved with slabs of stone; the upper rooms were open to the slanting roof.

The disease first occurred in the cottage of the butcher, and I could not ascertain that there was any reason to suppose that it was imported. It commenced in April, affected four children from 9 to 21 years of age, and ceased in July; all the invalids were out when I called. From this house a young man who visited there at the time took fever, and spread it in his own neighbourhood at a distance.

In the other house the disease appeared also about the middle of April, and two children first attacked were convalescent, but still thin, pale, and very delicate looking when I saw them. They were aged 12 and 5 years, and had been respectively ill four months and nine weeks, so they must have sickened about the 21st of April, and the 5th of June. Their mother, aged 38, had had two attacks, the last seven or eight weeks before, and was pretty well again. Two children were still lying ill in the same bed, but approaching convalescence, one at 14 had been ill two weeks, and the other at 12, twelve days. In both there was the usual flushed face and torpid expression of countenance, though they were capable of being aroused to protrude the tongue; they were both deaf. In each case the tongue was dry and somewhat brown, the skin harsh and dry, and the remains of several characteristic typhoid spots were detected. The abdomen was tumid, and there had been more or less diarrhœa. The pulse was feeble and somewhat quick.

The general condition of the cottages in this neighbourhood was extremely bad. In ——— cottage by Treweller Chapel there were nine persons residing, a son and daughter being quite grown up. It consisted of three small rooms, with little windows which did not open, had a slanting roof above, and was low and thatched, paved with stones below, and with no under-drainage, and no privy.

The state of ——— cottage was much the same, as well as that of several others which I visited in the church town; indeed in answer to special inquiries I found that there was never any under-drainage and seldom any privies to the cottages; and on the inquiry where the refuse was thrown, a heap of rubbish was pointed out lying undisturbed in front or at one side of the door. The cottages at Bosorn, to the S. E. of St. Just church town, were perhaps the worst in the whole district.

MEDICAL REPORT

On the State of the Miners in the Lead Mining Districts of Alston, Nenthead, Allenheads, and Weardale. By Thos. B. Peacock, M.D., F.R.C.P.

REPORT 1.

In the month of September last I visited the mining districts in the North of England, examined about 225 men at work at mines near Alston, Nenthead, Allenheads, and in Weardale, and took full notes of 25 cases of disease among miners in those districts, and at Middleton in Teesdale.

The forms of disease with which I met consisted of affections of the respiratory organs, disease of the heart, chronic rheumatism, general failure of power, dyspepsia, &c. I also found men suffering from various injuries which they had sustained when working in the mines.

1. *Bronchitic affections, Miners' Asthma.*—By far the largest number of cases of disease which fell under my notice were bronchitic affections, emphysema of the lungs, &c., the conditions known in the district as well as in the West of England as "miners' asthma," or "miners' disease or complaint." Indeed this form of disease constituted 18 out of the 25 cases of decided disease, which I have reported in the Appendix. In three of these cases the affection was only commencing, and in the remaining 15 the disease was so far advanced as to have completely incapacitated the labourer from following his usual occupation.

In the former cases the subjects of the disease were 31, 49, and 53 years of age. In one of the cases there were recent signs of pleurisy. In the more advanced cases the men were generally old; the mean age of the 15 being 57·7 years, and the extremes of age 70 and 67, and 44 and 49. In the latter cases, however, the men had been suffering under the disease, in some instances for several years; the period at which their health had first failed being on the average 49·08 years, and the extremes of age 60 and 56, and 34 and 44. It thus appears that they had been ailing on the average nearly 8 years; but in some instances the duration of illness was much more prolonged, having amounted to 18 or 20 years.

From the statements of the men examined, it appears that they became incapable of work on the average at 55·07 years of age, or at the extreme ages of 63 and 46; and the period during which they had worked as miners before becoming so seriously ill as to be entirely unable to work was on the average 40·6 years, and the extreme periods 57 and 28 years.

These calculations indicate that the health of the miners fails from asthma in middle age; but it will be subsequently shown that the men in whom the disease assumes the form of pulmonary consumption are incapacitated for work at much earlier periods. I am also satisfied, from information given me, that the asthmatic symptoms frequently if not generally manifest themselves at much earlier periods than the calculations would indicate. I was repeatedly told that "all miners who have attained middle age suffer in their breathing more or less, and that many of them who are young are similarly affected, though they will not acknowledge it." I met with several men who had gone to work underground at 14 to 16 or 18 years of age, and had only followed the occupation for 8 or 10 years, who said that they had given up working as miners, from being then in some degree affected in their breathing; and I have been assured that many men suffer at 30, and few escape beyond 40 years of age. The men who are getting into years, though they may still be able to work, almost always suffer from difficulty of breathing, either constantly, or in certain states of the weather, or when labouring under cold. Thus, of 24 persons above 50 years of age, whom I found still working in the mines, and who were questioned as to their health, all but eight stated that they were more or less "touched in the wind," or "short in their breath," &c.; and some mentioned that they suffered severely in this way. I feel convinced also that had all the men given a correct account of themselves, the proportion of those stated to be ailing would have been even greater.

That, however, I should not appear to overstate this fact, I may quote from a report made to me by a medical man of great experience in the diseases of miners, Dr. Ewart, the resident medical officer of the London Company at Middleton in Teesdale. "A healthy young man enters upon work in a lead mine; in a few years, more or less, he begins to experience some degree of difficulty of breathing—nothing to hurt him very much as he continues an efficient miner; still, however, 'he is touched in the wind.' Along with this difficulty of breathing there is an increased expectoration of mucus, often tinged, more particularly after leaving work, of a bluish black colour. The difficulty of breathing continues, and generally increases as age advances, rendered worse, perhaps, by an attack of bronchitis now and then supervening. On recovering from these attacks, he again resumes work; or, should it happen that he has no acute attacks, he goes on working with increased shortness of breathing, expectoration and failing strength. His appetite for food is impaired, and what he takes for breakfast is frequently vomited as he walks to his work in a morning. He has great langour, and frequent fits of severe coughing, and evidences of imperfect oxygenation of the blood in the blueness of the lips, &c. He may now have got to 40 or 45 years of age; he is low in health and strength, and is compelled to give up work, and stay at home as a worn-out miner. But even at home his health cannot be restored. He may wander about for some years, incapable of work, from difficulty of breathing and debility; in the summer improving a little, but in the autumn, winter, and spring being very liable to acute disease of the chest producing more copious expectoration of muco-purulent matter, tinged or rather streaked with blue or blackish spots. The poor worn-out miner now soon dies exhausted; that is to say, in a year or two he is cut off by persistent chronic disease of the chest, aggravated by acute or sub-acute seizures now and then taking place."

This report so clearly describes the asthmatic affections of miners that it is not necessary for me to dwell further upon the subject; and I have already fully explained the chief features and course of such affections in my report upon the diseases of the miners in Cornwall. I may, however, remark that while the asthmatic affections of the miners are similar in the two districts, it appeared to me that in the North the bronchitic symptoms were less frequently complicated by disorganization of the lungs, and that the sufferers were less exhausted, and their digestive organs less severely affected, than in Cornwall.

I am not in possession of information relative to the usual duration of life in the subjects of miners' asthma in the lead districts of the North of England. From the statements made to me, however, it appeared that not unfrequently when the miners cease to work underground their sufferings diminish, and, if they have not continued too long, they may ultimately recover so far as to be able to follow some occupation at the surface, and may survive for some years. If, however, their period of work underground has been prolonged, though their breathing when at the surface may be less affected, their strength does not materially return, and for the remainder of their lives they continue incapable of undertaking active work, or of following any occupation at all. In these respects also the condition of the miners in the North entirely corresponds with that of the Cornish miners.

Pulmonary Consumption.—Of this disease I met with four cases. As before mentioned the cases of consumption occured in men at an earlier age than those who suffered from the more decided forms of miners' asthma. The mean age of the patients was 37·5 years, and the extremes of age were 42 and 32. In three of the cases the period at which the health failed was ascertained to have been at the ages of 25, 31, and 35½. The patients had worked as miners for 12, 15, and 20 years before the commencement of the disease. In three of the cases there were evidences of hereditary predisposition; near relatives of the miners, and persons not employed in underground work, having also died of consumption. Indeed the circumstances under which the several forms of disease of the chest occurred among the miners in the North of England were similar to what had been observed in Cornwall. Men originally of feeble power, and especially if predisposed to consumption, falling victims to disease in earlier life, and after a shorter period of work in the mines; while those not so predisposed, and altogether of more robust constitution, resist the injurious influences of the occupation for a much longer period. The former also suffer from pulmonary consumption, while the latter become the subjects of asthma. Of the prevalence of consumption in the general population I am not able to speak, but I saw cases of the confirmed disease in persons who had not been employed in the mines.

3. *Diseases of the Heart and Large Vessels.*—I met with only one case of disease of the heart. In this instance the man was 71 years of age, but, though he had worked as a miner for 40 years, he had not been employed in the mines

for 20 years, and had since followed the occupation of a butcher. He had laboured under the symptoms of disease of the heart for about 12 months before I saw him, and was then dropsical, suffering from difficulty of breathing so severe as to prevent his lying down, and presented the characteristic signs of obstructive and regurgitant disease of the aortic valves. This affection could not, of course, be directly traced to his former occupation as a miner; but he stated that when so employed he had suffered from rheumatism, and probably might then have had some affection of the lining membrane of the heart, which laid the foundation of the subsequent disease. In another case, a man 37 years of age, who reported that he had recently suffered from chronic diarrhœa or dysentery, and was probably becoming consumptive, complained of suffering from palpitation of the heart, especially when using active exertion; and there was reason to suspect that the mitral valve might be in some degree defective. In three other cases, two of advanced miner's asthma and one of general failure of power with indigestion, difficulty of breathing, &c., the patients complained of palpitation; but no disease could be detected on examining the heart. The first case referred to, and possibly the second, constituted therefore the only instances in which decided disease of the heart was met with among the miners in the North of England. I was further assured by several medical men practising in the district that diseases of the heart and great vessels were not of frequent occurrence among the miners.

4. *Chronic Rheumatism.*—A man 47 years of age was reported to have been entirely incapacitated for work for four years, in consequence of suffering from chronic rheumatism. The affection commenced in the shoulders and then passed into the hip. He stated himself to be otherwise well and free from any difficulty of breathing. He ascribed his indisposition to having worked in cold and draughty places, but said that he had never been in workings that were particularly damp or where the air was bad. He first went to work underground when 10 or 12 years of age, and had been employed 31 to 33 years before his health failed.

In several instances, men labouring under other forms of disease complained of suffering from different kinds of rheumatic affection, or stated that they had formerly had rheumatic fever, or pains in different parts of the trunk or limbs.

5. *General failure of power, Dyspepsia, &c.*—The only other case which will be found fully reported in the Appendix is one in which a man, 66 years of age, was permanently disabled in consequence of general failure of power, difficulty of breathing, palpitation, and symptoms of indigestion. He had gone to work underground when about 9 years of age, and had been a miner for about 57 years, and had been unfit for work for two or three months.

In all the forms of miners' disease, symptoms of indigestion were of common occurrence. The men state, that, as a general rule, the miners have small appetites, while the pitmen take much food. Not only also do they frequently complain of want of appetite, but also of flatulency, nausea, and occasionally actual vomiting. The action of their bowels is uncertain; sometimes they suffer from diarrhœa; more frequently from constipation; and they are very liable to colicky pains in the bowels.

6. *Disease of Kidneys, &c.*—In some cases the men stated that they suffered from pains in the loins, and symptoms of gravel, but I met with no case of disease of the kidneys or dropsy among the men.

7. *Injuries.*—Among the cases only cursorily referred to will be found notices of two, in which the men were entirely blind, and were stated to have lost their sight from explosions or "shots" in the mines. I was also informed that there were two other miners in Alston parish who had lost their sight in the same way. I saw among the men at work several cases of partial blindness and injuries of the face from explosions, and heard of other injuries from falls of rock and in other ways in the mines. Several of the men were extremely deaf.

Causes of Disease among the Miners.

There is a striking uniformity in the causes which are assigned by the miners for the impairment of their health; the answer very generally being, when questioned on this point, that it was "bad air, powder reek, and stour."

"*Bad air.*"—The reports of the older men, and of the agents and medical officers, and indeed of almost every one connected with the mines, show that formerly the state of the mines as to ventilation was very much more defective than at present. The most striking accounts of the extremely deleterious effects of the air in which they had to work was given me by men who had been employed in driving the "fossway," extending from Alston to near Nenthead, which was constructed by the Commissioners of Greenwich Hospital some years ago. But, notwithstanding that great improvements have of late years been effected in the state of the mines, some of the workings are still evidently, from the reports of the men, very defective. I was repeatedly told by miners now at work, "that all miners have to breathe bad air, more or less," or that in "all mines there are places where the air is bad." From the Table of the assigned causes of disease in the men it will be seen that in 11 cases "bad air" is stated to have been the source of indisposition, and all but one of those who referred their illness to other causes or did not give any direct answer to the inquiry, stated that they had worked to a greater or less extent in bad air. When questioned as to the reasons which made them regard the air as bad, they frequently stated that the candles could not be got to burn, except when "heeled" or placed on one side, or when the wicks were being continually teazed out, or two candles were placed together. Sometimes, they said, that the candles could not be got to burn where they worked, and had to be placed some distance behind them. Occasionally, they stated, that the air was so bad that the candles would not burn at all, and they could not work in consequence; and they said that this was especially the case in dull days in summer and autumn, and might occur for several days together. A man to whom I spoke on his way home from Burtree Pasture Mine on the afternoon I was there, said that several men had been compelled to leave their work that day; and one of the men who was ailing and had been at work in the "fore end," said the air had been very bad. When asked to describe the effects of the breathing of bad air, the miners mentioned all those symptoms with which my inquiries in Cornwall had made me familiar. They said, that the bad air made them dizzy, sometimes adding, "as if they had been in liquor,"—caused violent headache, and made them feel sleepy, so that they could scarcely keep awake, and took all the power out of their limbs. Sometimes, they said, that they became quite faint; and I was told that the men had occasionally "fits" when working in very bad air, and had to be carried out. Not unfrequently they felt sick, and would vomit violently on coming to the surface; and they suffered from pains in the bowels, constipation or diarrhœa; were much prostrated, and had little or no appetite for their food on getting home.

The mines are generally in this district entered by "day levels," or horizontal shafts, running into the sides of the hills. From these, other shafts are raised or sunk, which open up the different levels and frequently reach the surface, so as to provide for the supply of fresh air through the different workings by a natural process of ventilation. It is chiefly when driving the "fore ends" or "foremost ends," or in the "rises" carried up from the different levels, or the "sumps" sunk from them, that the men are subjected to bad air. For the purpose of ventilating these "close places," air is frequently driven by a fan worked by hand or by water power, or by a water blast, and in some of the mines of Mr. Beaumont exhausting furnaces have been introduced. Of the efficacy of the latter plan, I had very decisive evidence in several cases; being assured by the men that the general atmosphere of the mines was much improved, and by the agents that places were worked which were before scarcely capable of being entered, or in which the men could only remain for a short time.

The "choke damp" or carbonic acid gas, which constitutes the most dangerous element in the workings of the mines, is doubtless partly the result of the combustion of the candles, the respiration of the men, and the explosion of the powder in blasting the rock. The agents, however, state, that it is given off from the strata, and especially the shaly strata or plates, and often escapes quite suddenly into the workings. This account was confirmed by several of the men, especially by one who had worked at the "fossway." He stated they had a bell which they could pull below to give warning if an escape of gas suddenly took place, in which case they were immediately drawn up, and sometimes, nevertheless, very narrowly escaped with their lives.

As I have before-mentioned, "*powder reek*" is also frequently assigned by the men as rendering the air of the mines very injurious to them, and they often complain of the length of time required in some places for the smoke to clear off after the blasts or "shots." Dr. Ewart, to whom I have before referred, ascribes much importance to the deleterious influence of the gases generated by the explosions of powder in the mines, and to the diffusion in the air of the unoxidyzed charcoal. He states, that when a miner is injured by an explosion, the face or hands are thoroughly blackened and remain so partially for life. He also ascribes to the charcoal so diffused in the air and inhaled by the miners, the "black spit" or blackish mucus brought up by the men when they leave their work, and which he states they often continue to expectorate for years after they have ceased to go underground. That this view is generally cor-

rect there can be no doubt; but it is well known that persons labouring under some forms of chronic bronchitis expectorate matter quite as dark, though they have never breathed a particularly smoky atmosphere. In such cases, therefore, the black matter must be excreted by the lungs, and cannot have been inhaled. It is therefore probable that the dark expectoration of the men who have long ceased to work as miners is, in part at least, an excretion, not entirely the carbon formerly inhaled. The candles also, as stated by the men, when burning so badly as they often do, and especially when the wicks have to be teazed out and the candles held on one side or two placed together, give out much dense smoke, and this must further deteriorate the atmosphere.

The "*stour*" or *dust* of the mines is often blamed by the men as a cause of indisposition, and some say that the "stour" is worse than anything else. The mines are chiefly driven in the shales or plates of sandstone and beds of limestone, and much dust is caused by the boring and blasting, and must, when the air is dry, be diffused in the workings and inhaled by the miners. Dr. Ewart thinks that in this respect also the atmosphere of the mines is very seriously detrimental to the men. He has published a case in which, after prolonged indisposition, cough, expectoration, difficulty of breathing, &c., a piece of sandstone as large as a pistol bullet, which had apparently been formed in one of the large bronchi by the accretion of small particles of sand, was expectorated by a miner. After the escape of the mass, the bronchitic symptoms were relieved. One of the men who had a curvature of the spine and stated that he had always been delicate, especially complained that his breathing was affected by the dust of the mines. Judging by the reports of the miners, I am disposed to think that dust or gritty particles, thrown off from the sandy strata in which they frequently work, considerably adds to their sufferings when employed in the mines. I think it probable also, that in this respect the northern mines are more injurious than those of Cornwall, which are generally worked in the harder crystaline rocks, and which, therefore, are probably less dusty. Some of the men especially complained of the dryness of the mines in connexion with the dust. Generally speaking, however, the atmosphere of the mines would appear to be damp; and the men often complained of the cold and damp and thickness of the air in the workings. It will be observed, that one man ascribed his severe rheumatic symptoms to working in cold draughts, and another blamed the cold for his illness. The mines do not appear, however, to be generally very wet, though there is often water in the workings and the men have to work with their feet wet.

Hard work, working too early, &c.—The other causes assigned by the men as probably affecting them were, "slavish work," and "working too hard when he had a good bargain,"—"going to work at too early an age,"—"working at night." One man ascribed his illness to having taken cold, from having to walk a long way to his home, there being no changing house at the mine. Another admitted that he had injured his health from having been a "hard drinker."

Ladder climbing.—I did not in any case find the climbing blamed by the men as having been injurious to them. Indeed, most of the mines, as at Nenthead, are entered by day levels; the men ride to their work in waggons drawn by horses or pushed by their fellows, which remove the waste and ore, and have only to use the ladders when passing between the different levels or up or down short shafts. They have thus not usually to climb more than 15 to 20 or 30 fathoms. In other mines, as in Mr. Beaumont's, at Allenhead and Burtree Pasture, the men are let down and drawn up by machinery moving by water power, and have generally not much climbing when below. It is not, therefore, probable that the little ladder work which they have can produce any very injurious effects.

Temperature of the mines.—The mines are also not apparently so hot as to exercise any injurious influence. When the men are working in very confined spaces, and there are many men at work, many candles burnt, and much blasting, the workings may become hot, but this does not generally seem to be the case. The mines are also usually only worked in two shifts each day, and for four or five days in each week; and thus there is much time for the effects of the blastings to clear off, and for the places to be kept cool. In only two instances did the men complain of the heat of the mines, or state that they regarded them as injurious on that account.

Of the different causes which have been enumerated as probably operating unfavourably upon the health of the miners, I am led to conclude that by far the most influential is the defective quality of the air which they breathe.

Comparison between the State of the Miners in the North of England and in Cornwall.

1. *General condition of the miners.*—I was much struck, in visiting the northern mining districts, with the more robust character of the men whom I found at work at the different mines, and the larger proportion of middle-aged and old men among them. On analyzing the reports which I then made, I find that they confirm the impressions formed at the time. On comparing the table of the condition of the men at work with the similar table showing the state of the Cornish miners, it will be found that there are a smaller proportion of young boys, and a larger number of middle-aged and elderly men, employed in the mines in the North than in those in Cornwall. It will further be seen that the state of the men, as judged of by their general condition and appearance and by their own statements, was better in the North than in Cornwall; the proportion of delicate and ailing persons being at all ages less in the North, and especially in more advanced life. On referring also to the ages at which the men permanently disabled by miners' asthma, &c. first went to work underground, and the ages at which their indisposition became so marked as to prevent their pursuing their occupation any longer, it will be seen that the period during which the miners were able to work in the North of England was much greater than in Cornwall. Indeed, the period of work in the North exceeds that in Cornwall by, on the average, 5·8 years. It does not, however, appear that there is the same difference between the periods at which the health of the miners first fails in the two districts;—the men in the North suffering from their occupation, probably at nearly as early an age as in Cornwall; but the affections under which they labour being less severe and less rapidly advancing, they are not so soon disabled.

2. *Diseases of the miners.*—The diseases met with among the miners in the North of England correspond generally with those observed in Cornwall, but present some differences. In both districts the men suffer frequently and severely from symptoms of indigestion, constipation, &c. Miner's asthma is, however, amongst all miners, the form of serious disease which is of most common occurrence, and which appears to indicate the ordinary process of decay in the men who are originally of healthy constitution. Next in frequency also in both districts is pulmonary consumption; this disease being developed at an earlier period than the former, and in men possessed of less constitutional vigour. It appeared, however, to me that miners' asthma was in the North usually a simpler form of disease than in Cornwall and less frequently complicated by the results of inflammation of the lungs occasioning serious disorganization of their tissues. I also found the affection in the North not so commonly complicated with disease of the heart as in Cornwall. Doubtless in all advanced cases of miner's asthma the right side of the heart undergoes dilatation, as in other similar forms of bronchial desease. In Cornwall, however, it was found that the miners labouring under asthma very frequently presented symptoms and signs of imperfection of the mitral valve; a condition not decidedly met with in any case in the North, though it may possibly have existed in one or two instances. Other forms of disease of the heart also occurred among the miners in Cornwall in several instances; and palpitation was a very common symptom in their various ailments. Whereas decided disease of the heart was only once met with in the North, and the affection could in that instance be only indirectly referred to the underground work. Palpitation also was not a frequent complaint in other forms of affection.

What then is the cause of the differences indicated in the condition and diseases of the two sets of men?

1st. *Ventilation of the mines.*—The mines in the North of England are worked by horizontal shafts or day levels, opening from the sides of the hills, sufficiently large to allow of the passage of waggons and horses, and by vertical "sumps" or shafts rising from the horizontal shafts at different levels or sinking into the lower strata. The horizontal shafts sometimes pass entirely through the hills, and the vertical shafts frequently open on the surface above. The mines also are comparatively shallow. They would therefore appear to afford great facilities for natural ventilation. In the mines in Cornwall, on the contrary, which communicate with the surface only by deep vertical shafts, the natural ventilation is more likely to be imperfect. It might, therefore, be supposed that the miners in the North breathe better air than in Cornwall. I cannot, however, think that the more satisfactory sanitary condition of the miners can be ascribed to the mines in the North being generally in a better state as to ventilation

and freer from "choke damp," &c. So far, indeed, as I can judge by the description of the men, I should think that the workings in the Northern mines were quite as frequently the seat of noxious gases as in Cornwall. Indeed I think their reports rather indicated a worse condition of certain parts of the mines in the North than in Cornwall. I have also before stated that, so far as dustiness is concerned, the Northern mines are probably more injurious to the men.

2nd. *Race.—Diet of miners.*—The miners in the North are certainly a more robust race; and it is probable, upon the whole, their diet is more nutritious than that of the Cornish men. Many of them, at least in some districts, as in Weardale, Nenthead, &c., are small farmers; they have plots of ground sufficient to keep a cow, and thus they are able to obtain milk, and probably altogether more fresh animal food than the Cornish miners ordinarily have. I do not, however, think that there is sufficient difference between the miners in the two districts in this respect to explain the differences in their sanitary state.

3rd. *Age at which they begin work.*—Throughout the mining districts of the North of England the miners do not now go to work underground at by any means so early an age as in the West. In none of the mines did I find that boys were allowed to work underground before they are 13, 16 or 18 years at age. The regulations of the London Lead Company are especially judicious on this point. No one is allowed to work underground in the Company's mines regularly till they are 18 years of age; but as, during winter, for three or four months, the climate is too rigorous for the boys employed at the dressing floors to work on the surface, those boys who are 14 years of age are allowed to work in the mines under the superintendence of the older miners during this time, and thus they are gradually inured to the underground work. This arrangement, I am assured by Mr. Carson, the company's medical officer at Nenthead, has very materially conduced to the healthiness of the miners who have come into work since it was adopted. He stated that there is now much less illness among the miners than formerly, and he does not think that, except this regulation and the better ventilation of the mines, there is any other alteration in their condition to which the improvement can be ascribed. When in Cornwall I was much impressed with the early age at which the boys were allowed to commence working underground, and with the delicate appearance which the younger men so soon acquire when working in the mines, and I think that some restriction as to the age at which the boys should commence is imperatively called for. I think also that an arrangement, like that adopted by the London Company, by which the boys would be gradually introduced to the underground work, would be most desirable throughout the mining districts. It does not, however, appear that the longer period of work in the North of England, of the men at present invalided, can be explained by their having commenced mining at a latter period of life than is usual with the Cornish miners. Indeed, most of the disabled men whom I examined had worked underground before the regulation referred to was introduced, and at ages quite as early as is now the practice in Cornwall. I find that on the average they began work when only 14 years of age, and some stated that they first went underground much earlier; the extreme ages at which they commenced being 7 and 18.

The circumstances which are mainly influential in favourably affecting the sanitary state of the men working in the northern mines, appear to be the comparatively short periods in each week during which the men work in the mines, the ready access to the mines without having to climb the ladders to any extent, the natural temperature of the workings, and the length of time during which they are left free.

4th. *Periods of work.* The men in the northern mines are ordinarily required to work for 5 eight-hour shifts in each week, making in all 40 hours of work. They are however allowed, if they so like, to work for longer periods than 8 hours, and a common plan is to work 4 daily shifts of 10 hours each. Thus, as the mines are generally at some distance from the mining villages, they frequently work on Monday, Tuesday, Wednesday, and Thursday; and return home on the Thursday, spending the remainder of the week in working on their small farms or in their gardens, or for the farmers in the neighbourhood. This plan has a double advantage. There can be no doubt that for men who work in the impure air of a mine the greatest possible protection from suffering is for them to be much in the open air when at the surface. The ordinary plan in the district is also for the mines to be worked in only two shifts in the 24 hours, except when driving ends or in cases of emergency. It thus results that the workings are left unoccupied for at least 4 hours in each 24, and entirely for two or three days in each week; an arrangement which allows of the offensive gases generated by the explosion of the blasting powder, and by the respiration of the men at work and the combustion of the candles, being got rid of by natural ventilation. At the same time the workings are so kept cool. In Cornwall the mines are generally worked six days in each week, and often for three 8-hour shifts in the 24 hours.

5th. *Climbing by ladders.*—I have already mentioned that the miners in the North of England have not much climbing by ladders. They, together with their tools, are usually conveyed to their work in waggons drawn by horses or pushed by their fellows, or by "lifts" or "skips" moved by machinery, and have only to climb the ladders for 10 to 20 or 30 fathoms in passing up or down shafts between the different levels. This I cannot but regard as a very important improvement upon the plan, generally adopted in Cornwall, of descending and ascending great depths by the ladders. It is, I believe, mainly to the hurried breathing and violent exertion in using the ladders that the frequency of affection of the heart among the Cornish miners is to be ascribed. The absence of this violent exertion and the hurried breathing so caused, goes far, in my opinion, to explain the better sanitary state of the northern miners, and especially the infrequency of diseases of the heart among them. I believe also that their greater vigour is much due to their being less exhausted than the Cornish miners from being conveyed to and from their work without any material exertion of muscular power.

6th. *Temperature of mines.*—The mines in the North of England do not appear to be generally so hot as to be injurious to the men. I met with only two or three of the men who made any complaint of this kind. The natural temperature of the mines is a great advantage to the men in two ways: they do not become, by any means, so much exhausted by their work, and are not so much tendered by it as to become very unduly susceptible to cold when at the surface. In the mines in Cornwall in which the workings are very hot, the men suffer much when below, and very readily take cold when at the surface. It is, I believe, mainly to this cause that the affections of the chest which occur among the miners in the two districts differ. In the North of England active inflammatory affections being rare and the asthma of a less complicated character; while in Cornwall the men more frequently have active inflammatory affections leading to consolidation and disorganisation of the substance of the lungs.

Effects of Dressing the Ores, Smelting, &c., on the men employed in those processes.

The surface works at the mines in the North of England is entirely performed by men and boys, chiefly the latter. In the London Company's works no boys are employed at the dressing of ores till they are 12 years of age. At Mr. Beaumont's works they commence at 10. I did not on inquiry hear that any of the persons thus employed suffered from the influence of the lead or in any other way from the work.

The London Lead Company have smelt works both at Nenthead and Eggleston, in Teesdale, and there were also smelt works in use at Allenheads. Formerly, I was told by medical men, in all these districts, that the smelters suffered from lead colic, and the same was confirmed by the reports of the men themselves. Sometimes, also, they seem to have had the more severe symptoms of lead poisoning, dropping of the hands, &c., but of late years, since the works have been better ventilated, these forms of lead poisoning have entirely disappeared, though the men still occasionally have colicky pains in the bowels, constipation, &c., and those especially suffer in this way who are employed in emptying the flues. Of 25 men whom I examined at different works, who either were then or had been employed as smelters, 10 stated that they had never had any symptoms of lead poisoning, and the other 15 said that they had formerly suffered to a greater or less extent; and all but five stated that they still occasionally had colic and constipation, though none of them apparently to any serious extent.

I examined the condition of the mouth in the men I have mentioned, and of the whole number 14 displayed the blue line upon the edges of the gums to a greater or less extent, several had their teeth and gums in a very unhealthy state, and some were pallid and anæmic looking. I did not meet with any cases of paralysis from lead. The acting superintendent of one of the mills had apparently had a sharp attack of lead colic.

The men stated that when they entered the flues from the furnaces and the condenser to clear them out at stated intervals, the sulphurous and other gases tried them very much in their breathing, and that occasionally they suffered from pain and confinement of the bowels afterwards. The

flues are, however, by recent improvements, to a considerable extent emptied of their contents, and especially of the lighter and therefore more injurious portions, by currents of water which are continually passing through them, and thus the men are less likely to suffer.

I was told that at Nenthead the exit chimney of the smelt mill was formerly situated at about 800 yards from the furnaces, and in a somewhat lower situation, and at the time the residents in a group of cottages near the chimney suffered from symptoms of dyspepsia, with a tendency to colic. Since the chimney was placed at a further distance of 400 yards, and in a more elevated and exposed situation, this has entirely ceased.

I was assured from the experience of the Benefit Society of the London Company that the smelters were longer lived than the miners, and amongst the men whom I examined were several in very advanced life, and who were yet hale and strong for their ages.

REPORT 2.

Ages of Men at Work at Nenthead, Allenheads, and Burtrie Pasture Mines.

12 to 16 years of age,	4	ratio per cent	1.96	18.13 per cent.
17 to 20 „	33	„	16.17	
21 to 30 „	66	„	32.35	54.4 per cent.
31 to 40 „	45	„	22.05

61 to 64 „	4	„	1.96	
Total	204	Mean age	31.5	

State of Miners examined at Nenthead, Allenheads, Rodderup Fell, and Burtree Pasture Mines.

Under 21 years of age; Total 41:
Healthy, 36; pale, thin, &c., had sustained injuries, 3;=39. Ratio per cent. 95.1.
Delicate and complaining, 2. Ratio per cent., 4.8.

From 21 to 40 years of age; Total 124.
Healthy, 106; pale, thin, &c., had sustained injuries, 10;=116. Ratio per cent., 93.5.
Delicate and complaining, 8. Ratio per cent., 6.4.

From 41 to 64 years of age; Total 60.
Healthy, 31; pale, thin, &c., had sustained injuries, 1;=32. Ratio per cent., 53.3.
Delicate and complaining, 28. Ratio per cent., 46.6.

Total: Healthy, 225; pale, thin, &c., had sustained injuries, 187. Ratio per cent., 83.1.
Delicate and complaining, 38. Ratio per cent., 16.8.

Forms of Disease among the Miners in the North of England.

Commencing miners' asthma, 3 cases; confirmed and advanced 15, -	18
Palmonary consumption - -	4
Disease of heart - - -	1
Chronic rheumatism - - -	1
General failure of power, asthma, dyspepsia, &c. - - -	1
	25

Ages of Men affected with Miners' Disease.

Mean age of 18 cases, 55.5.
Extremes of age, 70 and 67, and 31 and 44.

Age at which the Health first failed in Men permanently disabled.

Mean age of 13 men, 49.18.
Extremes of age, 60 and 56, and 34 and 44.

Age at which Men permanently disabled became unfit for Work.

Mean age in 14 cases 55.07.
Extremes of age, 63 and 46 and 47½.

Ages at which the Men permanently disabled began to work underground.

Mean age of 17 men, 14 years.
Extremes of age, 7 and 18.

Assigned Causes of Disease in Men labouring under Miners' Asthma, &c.

Bad air and slavish work - - - -	1 case.
Bad air, powder reek, and stour - -	3 cases.
Bad air, smoke, and damp - - -	1 case.
Bad air - - - - - -	1 „
Much bad air and beginning to work too soon (at 9 years of age) - - -	1 „
Powder reek and stour (but had also worked in bad air) - - - - -	2 cases.
Bad air and powder reek - - -	2 „
Had been a great drinker (but had also worked in bad air) - - - - -	1 case.
Taking cold (but had worked in bad air) -	1 „
Cold and influenza (but had in worked in bad air) - - - - - - - -	1 „
Working at night and in bad air and powder reek, and getting cold in coming to the surface from there being no changing house -	1 „
The stour and bad air, and working too hard when he had a good bargain - - -	1 „
Had always been ailing, but air of mines made him worse - - - - - -	1 „
Working in cold draughts (never in bad air) -	1 „
No precise cause assigned, but had all worked in bad air - - - - -	7 cases.
	25

Period of work in persons permanently disabled by Miners' Asthma.*

In North of England, 14 cases—
Mean period 40.6 years.
Extremes 57, and 28 years.

In Cornwall, 15 cases—
Mean period 34.8 years.
Extremes 52 and 15 years.

---

* I have taken this form of affection alone as indicating the mode of breaking up of the miners when their powers are not prematurely exhausted by accidental diseases

APPENDIX 2.

Brief Notes of Cases of Disease, &c. among Miners in the North of England.

Clitheroe, &c., Alston, Aug. 3, 1863.—No 1, aged 45. "Blinded by a shot," April 29, 1862, at Stone Croft Lead Mine, Northumberland.

Nenthead, Aug. 3, 1863.—No. 2, aged 42. Blinded in blasting, 8 or 10 years ago.

Two other blind men are said to be in the parish of Alston who are blind from injuries in blasting.

No. 3, aged 50, who lost his sight 10 or 12 years ago, and No. 4, aged 30, injured a year ago.

There are several other men who have sustained partial injuries of the eyes in the same way.

Alston, Aug. 5, 1863.—No. 5, aged 35. First went underground when 18 years of age, and worked for 8 years in Mr. Beaumont's mine at Coalcleugh, and then left and went to Australia. He was at the time a little touched in the wind. "All miners suffer more or less at the chest, and many quite as young as he was." "Some parts of the mine were very bad; the candles could only be got to burn by putting two together, and heeling them on one side, and then they gave out much smoke. The smoke also lay long in the mine when they fired a shot. Sometimes for days together the candles could not be got to burn at all, and they could not get in to their work. The bad air made them heavy and sleepy, and took the power out of their limbs, and he had known persons carried out as if dead from working in it." Since his return from Australia he has not worked underground. He is now delicate looking.

Rodderup Fell, Aug. 5, 1863.—No. 6, aged 60. Went underground at 20, and has worked steadily ever since with some short breaks. Latterly his health has failed, and he has been laid by with two attacks of influenza, and has "whiles been bad with his wind." He was incapable of working 12 months ago, and was seen by Mr. Bankart. He is now "a little bad in the wind," but is better than he has been, and he is at work. He is old-looking, and pale and thin.

Alston, Aug. 6, 1863.—No. 7, aged 25. Went to the mines at 19, and worked underground for a year, when he injured his eye and one hand by a blast, and has not worked since. He has recovered his sight, but his hand is much shattered. He has worked as a hostler for 6 years. The mine he worked in was dry and stoury, there were some bad places; "but it was not so bad as some." "Very near all miners are more or less touched in the wind."

St. John's Chapel in Weardale, Aug. 6, 1863. Mr. Hewitson.—No. 8, aged 25. Went underground at 12, and has worked as a miner till he got ill. He has had an attack of gastric fever, with predominant head affection, and is now nearly recovered. He was very deaf before his attack, and continues so.

Ireshope Burn, Weardale, Aug. 6, 1853.—No. 9, aged 45. Went underground at 12, and has worked as a miner ever since, except when away from ill health. He has been out of health at times for the last 3 or 4 years, suffering from inflammation of the bowels. He has been laid by recently for 18 weeks, and is now only just able to return to the mine. His appetite was very bad, and his food did not agree with him, and he had pains in his bowels, and diarrhœa or dysentery. He looks pale and thin and delicate.

Middleton in Teesdale, August 7, 1863.—No. 10, aged 70. He went to work in the mines when he was 10 years of age, and worked regularly for 55 years with little intermission, and always in the Company's service. He never suffered till he had worked 30 or 40 years, or till he was 40 or 50 years of age. He has worked in some very bad places, and for 10 years was always in bad air, more or less. That was when he was from 25 to 35 years old. The candles could scarcely be got to burn from the badness of the air; but he thinks it was not so much the bad air as the dust that hurt him. The last place he worked at was a shaft which they were drivin to meet an adit, and he worked at this three or four years.g It was not very bad, for they had a blower at the top moved by hand. He left working underground when 56 or 58, or 12 or 14 years ago, and worked at the surface six or eight years. He has not worked at all for six years, and is pensioned by the Company. He is an active hale man for his age.

Allenheads, Aug. 4, 1863. Mr. Hewitson. Cases of fever.—I visited at the School Hill, Allenheads, two patients labouring under fever, apparently typhoid or gastric, and which, from the history given me by Mr. Hewitson, was certainly imported and had spread by contagion.

A young man, a schoolmaster at Fir Tree, about 25 miles from Allenheads, was taken ill with fever, and his sister residing at Allenheads went to nurse him, and was with him about a week when he died. She then returned home, sickened with fever a few days after, and died, after an illness of about a week, on the 26th of July. When I visited the house on the 4th of August there was a sister about 25 years of age, ill in bed, and presenting the usual symptoms of typhoid,—oppression of the brain, prostration of strength, and diarrhœa, with fullness of the abdomen, but without any spots, which had commenced six or seven days before. A brother also, about 20, was evidently sickening, and had been poorly two days. The first sister who died had symptoms of typhoid, but not any of the rose-coloured elevated spots.

Nenthead, Aug. 3, 1863.—Dr. Carson stated that he formerly saw much more of miners' disease than he does at present. Ten or 12 years ago he had always two or three cases of disease in the last stage under his care. Now, he has never at any time more than one or two cases. This difference he ascribes to the better ventilation of the mines, and to the more advanced age at which the men commence to work underground. Formerly they went very young, now they are not allowed to go to the mines before they are 18, though at 14 they work underground during the cold weather in the winter. There is no marked alteration of any other kind in the circumstances of the men; their wages are much the same, and there is no material change in their mode of living.

When at Middleton, 28 years ago, he occasionally saw lead colic among the men, and had seen dropping of the hands, but the men do not now suffer materially, the smelt mill being better ventilated.

The men are generally temperate in their habits, there may be some few who take a pint of ale after they finish their work in the evening, but the majority take none, except on pay nights, and then some may perhaps take too much. They smoke too much. The men live much upon tea and bread. They do not usually get animal food, except a little bacon, but they generally have a good dinner on Sundays. The men, some of them, have gardens and others ground enough to keep a cow, which helps them much, for generally there is a difficulty in getting milk.

There is no changing-house or "shop" at Nenthead, but the men live within a short distance of the mines, and change and wash at home.

Dr. Carson obligingly took me to the cottages inhabited by the various classes of workmen at Nenthead.

The cottages built by the company for the smelters are very good; they are pleasantly situated on one side of the valley with a bank sloping to the Nent, laid out as gardens. The cottages have two large and high rooms, are properly drained and have a yard behind, with a coal cellar, dust bin, and privy. The only objection is, that the rooms are only two in number, and this, for large families, is tao few, and was complained of by some of the residents.

In a group of recently built miners' cottages, the company have so enlarged the dimensions as to admit of two rooms on the ground floor and two bed-rooms above.

There are other cottages not belonging to the company, which are defective, and some of them are most objectionable. A portion of these cottages are thatched, have only two small and low rooms, the upper in the slanting roof, and sometimes only reached by a ladder; there is no under drainage, sometimes no privy, and rarely any garden ground. One row was especially defective, the houses being divided across so that there was one tenement in front and another behind, and of course no thorough draught.

The company provide schools, a reading-room, and medical attendance in accident or sickness, and there is a fund in connexion with the mine to which most of the men belong, and which gives relief, temporarily in case of sickness or accident, and permanently when the miner is disabled from following his occupation any longer. There are also clubs in which the men are enrolled.

Mr. T. Millikin.—The levels have for many years been driven 6½ feet high and 4½ feet wide, and they vary in depth from 20 to 100 fathoms. There are a great number of surface ventilating shafts, besides the various levels of the different mines, all communicating with each other, as well as the upper and lower levels of each separate mine. At the western boundary they likewise communicate with Garrigill mines, and at the eastern boundary, with the Coal Cleugh mines. The Rampgill mine, where it communicates with the Coal Cleugh workings, is one mile in length. Ladders are used from the various levels to all the different workings, which will not average 15 fathoms in height.

The mines are, as a whole, dry, and are chiefly worked by blasting.

Artificial ventilation is adopted in all the progressive new openings, such as levels, rises, opening drifts, &c.; this is done by means of trap doors, hand airing machines, and

various other machines, which are carried by water. There are trams laid in the day levels, along which small trucks are pulled by horses or pushed by the men, and when the miners go to their work their tools are placed in the trucks, and some ride whilst others push the trucks.

MIDDLETON IN TEESDALE, MR. BAINBRIDGE.—The required working hours of the miners is 40 hours per week, divided into five daily shifts of eight hours each, whenever the mines are near the residences of the miners, as in the Alston Moor district; but in Teesdale, where the mines are scattered and at a great distance from the miners' residences, then five 8-hour shifts are converted into four 10-hour shifts, and other equivalents of the weekly 40 hours.

It is only in urgent cases, such as the driving the level or drift to its destination, or the completion of communications to the surface, that the men are required to work three 8-hour shifts in the 24 hours. It is in these cases that the ventilating fans and water blasts are used to propel pure air through cast-iron pipes to the points where the men are working. When communications have been effected between drifts and rises and sumps and the surface, reliance is placed for ventilation upon the currents of air passing between the level mouth and the surface shafts.

The men, when working at mines at considerable distances from their homes, live at "mine-shops," provided for the purpose in the immediate vicinity of the mines. These generally contain separate changing, mess, and bed rooms, with a washing room provided with a stream of good spring water, which flows first into a wooden trough, in which the miners place their cans of milk for the purpose of keeping it fresh and cool, and then into a trough for washing. There is also a separate room or pantry for the deposit of the miners' wallets, containing the provisions which they bring with them from home for their support during the week. The ventilation of the sleeping-rooms is promoted by openings in the walls covered by perforated zinc plates, and by a double cylinder passing from the roof into the open air, the inner being longer than the outer, and both so capped as to prevent the entrance of snow and rain, or of too strong a downward current of air.

The beds and blankets in these shops are provided by the company, and are washed by the men.

When in the mines the men wear a flannel shirt and cap, with a vest and trowsers, which are taken off on leaving the mine and hung up in the changing room to be dried by the fire which is kept always burning.

Some of the working miners are small "statesmen" or the sons of "statesmen" whose properties are inadequate to their maintenance, but the larger proportion of them are merely the tenants of the lords of the mines and other landowners in the neighbourhood, and a still larger proportion have not more than a cottage and garden, but there are comparatively few who have not the opportunity of cultivating a garden. The district in which the mines are situated does not afford agricultural employment, but some of the men obtain occasional day's work in the improvement of the meadow and pasture lands.

No women or girls are employed about the mines in any way. The boys must be 12 years of age before passing from the school to the ore dressing floors; and during the suspension of the "dressing" in the depth of the winter, which as Middleton is about 700 feet above the sea, is severe and prolonged, the washer boys who are 14 years of age are placed as labourers with the underground pickmen. They thus get about three months work underground during each year till they are 18 years of age, when they are usually allowed to work regularly in the mines, but in recent years the need for employment of the boys at the ore dressing has been such as to occasion their engagement there up to 20 years of age, which will doubtless contribute to their healthy stamina, whatever may be the effect upon their skill as miners.

The company have schools for their workmen's children at Nenthead and at Middleton in Teesdale where the majority of their miners reside. In the more distant districts and where they have not schools, the company assist the local schools, and allow the parents to select those to which they send their children, on the condition that the company's inspector shall ascertain that the children are efficiently taught.

The reading rooms at Nenthead and Middleton were erected at the company's expense, and the cost of cleaning, heating, and lighting is borne by them. The members attending the room contribute 3*d.* monthly towards the purchase of newspapers and periodicals; an exception being made to youths under 18, who only contribute 2*d.* monthly. The general management rests with the members themselves. There are also free libraries open to all their workmen, and numerous village and hamlet libraries which the company have aided in establishing, and to the maintenance of which they contribute.

In Middleton there is a very large and beautiful schoolhouse which has recently been erected by the Company. I visited with Dr. Ewart numerous excellent cottages with four large and high rooms, and properly provided with all conveniences, and with back yards and gardens and underdrained, built by the Company for their own people. There are also numerous good cottages built on their own freeholds by the workmen.

In the Company's recently erected cottages a system of ventilation has been introduced which appears to act very efficiently. A tile pipe is extended from beneath the ceiling of the rooms in the wall along the side of the chimney flue, (but without any connexion with it) which has an outlet in the side of the chimney above the roof. The air in this tube becomes rarified by the heat derived from the adjacent smoke flue, and so the impure air from the room is removed.

The Company's benefit society includes all the regular workmen in their employment, together with the agents, clerks, overseers, &c. if they are anxious to become members. The members on entering the society must be in good health, and pay a fine proportioned to their age, and subsequently contribute 30*s.* a year till 65 years of age. From the society they receive 7*s.* a week when entirely laid by from sickness or infirmity, or a less sum if capable of partial occupation. At the age of 65 all contributions cease, and the members are entitled to 6*s.* per week, whether in sickness or health, for the remainder of their life.

The fund also makes a contribution at the death of the workman or his wife, and a small donation to the widows of those who have been upwards of a year members of the society.

The Company provide medical attendance in cases of sickness and accident, and have resident medical men at Nenthead and Middleton, whose duty extends to the families of the workmen (including midwifery), all free of charge to the workmen.

ALLENHEADS.—At Allenheads there is a reading room and school house provided by Mr. Beaumont for the miners, and numerous good cottages, some the property of the proprietor, others built by the workpeople. There is also a school house in Weardale.

MR. BEWICK.—At these and the other large mines belonging to Mr. Beaumont, until recently, the only parts which required artificial ventilation have been the foreheads or foremost ends of particular drifts, which had no through communication, and these have been hitherto almost invariably ventilated by propulsion by means of fans, bellows, water blast, or other adaptation, according to circumstances. Within the last two or three years ventilation by means of exhaustion has been introduced on the Blackett Level (new) Works. At one point on this work the air is extracted from the forehead in metal air pipes five inches diameter, connected with a pair of cylinders having valves similar to Struve's plan. These cylinders are fixed at the surface at the commencement of the level, (which is already driven nearly half a mile and daily increasing,) and are worked by a water wheel eight feet diameter.

At two other places on the Blackett Level exhausting fans on Biram's principal are applied; at one of these two and at the other three foreheads are ventilated. In each of these cases the machines are placed near the top of a vertical shaft or pit, a five inches air pipe being carried from each forehead along the level, up the shaft, and to the machines at the surface, both of which are driven by water wheels.

At another of the shafts on the Blackett Level where there are two foreheads, the fresh air is propelled from the surface by a fan connected with air pipes (5 inches diameter) which pass from the fan down the shaft and to each forehead. This fan is also driven by a water wheel.

The advantage of exhaustion over propulsion or vice versâ, is not yet satisfactorily decided. In narrow airless foreheads propulsion has the advantage of delivering a current of pure air at the place where the miners are occupied, whilst by exhaustion, the fresh air which has passed into the mine to replace the exhausted air, becomes deteriorated before it reaches the workmen. In ventilating a large area, or series of mines, exhaustion is, I think, preferable.

The general ventilation of the older and more extensive mines of Mr. Beaumont is carried out by shafts and levels without the intervention of artificial or machine ventilation, the only exceptions to this are the two furnaces, one at this place and another at the Burtree Pasture Mine in Weardale.

The Allenheads furnace was first lighted in July 1861, and has since continued without intermission, except for repairs, &c.; that at Burtree pasture was commenced in October 1862, and has since been in constant operation, except for about four months in the beginning of this year. Each furnace is in connection with the whole mine, but where the levels are far distant—say, 1 to 1½ miles—the effect is not perceptible. By these furnaces the atmosphere of the

mine is rendered more generally pure. The smoke from the explosion of the gunpowder and other deleterious matters are more quickly carried away, and the men are enabled to work more energetically for a longer time and with less fatigue than they could previously, and in fact, in some places under particular atmospheric conditions, they were, before the furnaces were erected, occasionally unable to pursue their work.

There is only one other furnace that I know of in the Northern Lead Mining Districts, and that is at Fallowfield Mine, near Hexham. The workings are comparatively limited, and it is only occasionally necessary to light the furnace.

Our experience of the furnace for ventilation is highly satisfactory, and its usefulness in ventilating extensive workings underground cannot, I think, be questioned.

The two furnaces and the three machines on the Blackett Level are the only cases of ventilation by exhaustion in this district.

The vertical shaft at this place is 77½ fathoms deep, but it is at 40 fathoms from the surface where the main horse level strikes off into the workings. There are many other shafts and levels connected and communicating with the surface, so that many parts of these mines are naturally ventilated. The different levels are connected by ladders or inclines, but more generally by the former. The men at this place have not to climb much, but at Burtree Pasture mine there is a good deal of climbing. Taking Mr. Beaumont's mines as a whole, there is not a great amount of ascending and descending by ladders; many of the mines are worked by adits, others by vertical shafts at which is erected machinery for winding, by which the workmen are brought to the surface, and with the exception of Burtree Pasture none of these mines can be considered deep, at least they are far short of the Cornish and other metallic mines.

Burtree Pasture mine is worked by day or adit levels, and by vertical and inclined shafts. The main or horse level, from its mouth to the forehead, is a little over two miles in length. In this however are several sumps, communicating with other higher and lower levels, and there are two shafts which communicate with the surface, at the top of one of which is placed the furnace, 96 fathoms above the horse level. The deepest workings for lead ore are 134 fathoms below the horse level, or 230 fathoms lower than the furnace, but not immediately beneath it. The furnace is more especially applied to ventilate that portion of the workings extending beyond the shaft at which it is placed, but it has a beneficial effect over the whole mine, the air being chased or traversed through the various workings by means of trap doors and such like. With the exception of the furnace, and any especial foreheads in which there is not a through communication, there are no artificial means of ventilation at this mine. Generally speaking, when air is forced into a forehead, it is not from the surface, but from the nearest ventilated point (say, in one of the main levels) underground. The maximum distance from the surface, by existing levels and shafts, of any working in this mine, is 785 fathoms.

In this district the levels are generally drifted of an egg-shaped section, the maximum dimensions being 6 to 7 feet high, and 3½ to 4½ feet wide. There are of course exceptions to these dimensions, both in height and width, but these are the usual sizes. The workings for ore are of almost every conceivable size and shape, from 2 to 20 feet wide, and 6 to 60 feet high but generally the veins are from 4 to 6 feet wide, and the ore is worked by headings, roofs, and soles; when a roof working gets to a height beyond reach, a timber floor or "bunding" is fixed, from which the miners continue their operations. When the ore is found in "flats" the height is from 3 to 6 feet, and up to 60 or 70 feet wide on each side of the vein, but the width is exceedingly irregular. In the Burtree Pasture mine, as before mentioned, the men have a good deal of climbing; this is owing to the great depth of the workings, and the want of machinery adapted for winding them down and up the shafts. This will, however, I hope, shortly be obviated by the erection of suitable machinery.

Mr. Beaumont's mines, as a whole, are dry: there are, no doubt, many wet places, but in the Great Limestone, and some other of the most productive strata, there is little water.

Boys are not employed until they are 10 years of age, and then only on the surface in dressing the ores and such like. None are employed in the mines under 13 years of age, and unless they are robust and healthy they must be 15 or upwards. Much depends too on the place of work. Youths of from 13 to 18 are not allowed to commence in the mines unless the place is unobjectionable as regards ventilation, &c.

In connexion with the Allendale mines there is an arrangement for providing medical attendance and medicines to the workmen and their families. Each workman who is a householder pays 5*s.*, unmarried workmen or lodgers 2*s.* 6*d.*, and boys about a day's pay, per annum. The married workmen in addition pay 7*s.* 6*d.* for each midwifery case. These sums, except the last, which is paid in full, are paid by half-yearly instalments at the offices of Mr. Beaumont, and go towards payment of the salary of the medical officer of the district; the deficiency, about 47 per cent., being made up by Mr. Beaumont. The surgeons are appointed by Mr. Beaumont, and receive a quarterly salary; they have to provide medicines, and give personal attendance, in all cases of sickness of the workmen or their families resident within a certain fixed district. The payment from the workmen living in that district is compulsory, but those residing beyond the limits are not required to pay the annual contribution, and do not receive the benefit of the surgeon of the works, except by paying his charges as an ordinary practitioner. The medical officers are, in addition to their salary, allowed any private practice of the district. In *all* cases of accident the surgeon of the works attends without extra pay, and he has also to examine and report on the health of candidates for admission to membership in the benefit societies on the same terms. Non-workmen, members of the benefit society, may have the benefit of the surgeon for themselves, but not for their families, on paying at the same rate as workmen, and on condition that they intimate such to be their desire on *entering* the society. In the Allendale mines there are two districts—East Allendale and West Allendale; and there is a resident surgeon engaged by Mr. Beaumont for each district. In the Weardale district no such arrangement exists.

Quite independent of the preceding, there are benefit or friendly societies in the different localities. Those at Allenheads and in West Allendale were established within the last 17 years; the former in 1850, the latter in 1847; and both are most liberally supported by Mr. Beaumont on the principle that help is given to those that help themselves. The funds are, however, quite distinct, and under the entire control of the members. The tables were prepared by Mr. Neison, and the payments are proportioned to the age of the member on entering, and the amount of "sick pay" or "sum at death" for which he chooses to enter. Membership of this society is entirely voluntary. Mr. Beaumont subscribes aunually in proportion to the amount contributed by the ordinary members, and according to the funds safely and satisfactorily invested at the termination of each year's transactions. Thus, at the end of each year, Mr. Beaumont contributes *five per cent.* on the total amount paid by the ordinary members during the year, and *two per cent.* on the total capital at that time. These sums are guaranteed for periods of five years, and are purely donations. The monies of the societies are invested in the National Debt Office, the local Savings Bank, or on mortgage. Mr. Beaumont derives no direct benefit from, nor has he any control over, the funds.

In consideration of Mr. Beaumont's contribution, non-workmen are admitted members by permission of himself or his chief agent, and on payment of one halfpenny per sixpence or part of sixpence beyond the rates specified in the tables. It is also a condition that a workman, on leaving Mr. Beaumont's service of his own accord or for misconduct, has his contribution to the benefit society increased in the same proportion; but, on the other hand, when a non-workman member enters Mr. Beaumont's service, his payment is reduced to the rates given in the tables.

Except the trustees, all the officers of these societies are elected annually by the members. There is no restriction on their choice, except what is stipulated by their rules, viz., that not less than one-half of the committee shall be chosen from among the honorary members.

The trustees (not less than one-half of whom must be honorary members) are likewise elected by the members, but for life, or until they resign or are disqualified. These societies by special tables provide for annuities to commence on attaining 70 years of age, but not one has been subscribed for.

Similar benefit societies do not exist in Weardale, but the Miner's Lodge of Odd Fellows at St. John's Chapel numbers many members (mostly miners), and has a large capital. There is also a benefit society, the members of which meet at the Miner's Home at Newhouse Office, belonging to Mr. Beaumont, and, although an old society, it has few members, and is not flourishing.

At Allendale Town, too, there is an Odd Fellows Lodge, and a Friendly Society called the Royal Oak or "Private Club," in consequence of its meetings being held in a private house; but these societies, although doing much good, are not in prosperous circumstances.

The majority of the members of all the friendly societies

in these districts are miners, or workmen connected with lead mining, the staple trade of the locality.

The East and West Allendale and the Newhouse Benefit Societies have, by Mr. Beaumont's kindness, the free use of his miners' rooms for holding the monthly or other meetings, and firing and candle-light, gratis, at the respective places.

There is a building society established in the district, the head-quarters of which are at Allenheads. To this the owner of the mines does not contribute, but allows the members the free use of the Miners' room in which to hold their meetings, and at certain places on his property the members have the opportunity of purchasing freehold building sites at a very moderate rate.

There are no "mine shops" or "changing houses" in connection with the Allendale mines. Most of the miners live near the place, and go home to change. Others who live at a distance change in the cottages adjacent to the mines, and pay the cottager a nominal sum for the accommodation and for drying their mining clothes. In Weardale, where the mines are spread over a larger area, there are several "mine shops" or "barracks," in which the miners live during the five days they are at work each week, carrying their "wallets" and preparing their own food. For these shops Mr. Beaumont provides firing, fittings, and furniture of a rough kind, and each workman finds his own bed-clothes, plates, knives, and forks, &c.

Note, February 23rd 1864.

With reference to the propulsion or exhaustion of air for ventilating close foreheads in mining, from further experience on the Blackett Level Works the two Biram's exhausting fans have been removed and propelling machines substituted. The exhauster on Struve's plan continues in operation, and works satisfactorily. The great advantage in propulsion is the delivery of the pure cool air at the heading where the miners are at work.

MINERS AT WORK.

APPENDIX 3.

AT LONDON LEAD COMPANY'S MINES AT NENTHEAD.

Age of Miner.	At what age he began to work underground.	How many years he worked underground.	Whether he has ever suffered from any serious illness, and is now quite well. If not, of what does he complain.	Condition and Appearance.
38	19	19	No. Yes. But "rather touched in the wind."	Healthy.
22	14	8	No. Yes.	Healthy.
27	19	8	No. Yes.	Healthy.
33	20	13	No. Yes.	Healthy.
50	18	32	No. Yes.	Healthy.
24	18	6	No. Yes.	Healthy.
19	18	1	No. Yes.	Healthy.
29	23	6	No. Yes.	Healthy.
42	18	24	No. Yes.	Healthy.
55	18	37	No. "Middling well."	Healthy.
41	21	20	No. Yes.	Healthy, deaf.
18	Just beginning.	—	No. Yes.	Strong and healthy.
22	18	3	No. Yes.	Healthy.
30	19	11	No. Yes.	Healthy.
31	17	14	Injured by a blast.	Healthy.
19	18	1	No. Yes. *	Healthy.
29	20	9	No. Yes.	Healthy.
31	17	14	No. Yes.	Thin and pale.
22	18	2*	No. Yes.	Healthy.
25	19	6*	No. Yes.	Healthy.
28	26	2	No. Yes.	Healthy.
49	18	31	No. Yes.	Rather worn, but fairly healthy for the age.
20	18	2	No. Yes.	Robust.
27	19	8	No. Yes.	Healthy.
41	19	22	No. Yes.	Healthy.
43	17	31	Away for a fortnight with pleurisy, otherwise no illness, and now well.	Healthy.
41	18	23	No. Yes.	Healthy.
30	18	12	Eye injured by blast a year and a half ago.	Healthy.
24	18	6	No. Yes.	Healthy.
27	18	9	No. Yes.	Healthy.
30	18	12	No. Yes.	Thin but healthy.
20	18	2	No. Yes.	Robust.
24	18	6	Suffers from rupture, otherwise Yes.	Healthy.
31	19 Went underground to blow engine at 7.	12	No. Yes.	Healthy but rather pale.
31	18	13	No. Yes.	Healthy.
38	11	27	No. Yes.	Healthy.
35	18	17	No. Yes.	Rather pale and thin.
45	8	37	No. Yes.	Healthy.
52	10	42	2 or 3 years ago ill for 17 weeks.	Fairly healthy for the age.
22	18	4	No. Yes.	Healthy.
44	18	26	No. Yes.	Healthy.
52	9	43	Has suffered from bad colds, and only has "middling" health.	Fairly healthy for the age.
27	18	9	No. Yes.	Healthy.
30	9	21	No. Yes.	Healthy.
43	18	25	No. Yes.	Healthy.
31	18	13	No. Yes.	Healthy.
33	12	21 Was away 4 or 5 years & then returned again.	Suffered from pain in back and kidneys 6 years ago, now well.	Healthy.
21	18	3	No. Yes.	Healthy.
28	19	7	No. Yes.	Healthy.
46	20	26	No. Yes.	Healthy.
32	18	14	No. Yes.	Healthy.
26	18	8	No. Yes.	Healthy.
24	18	6	No. Yes.	Healthy.

* Employed in Mr. Beaumont's mine.

FORMERLY MINERS, NOW WORKING AT SURFACE

Age at present.	Age at which he went under ground.	How many years he worked under ground.	At what occupation now employed.	Whether he has ever suffered from any serious illness, and is now quite well. If not, of what does he complain.	Condition and Appearance.
45	20	10	Foreman of washing floor.	No. Yes.	Very Robust.
50	18	not stated	At washing floor.	No. Yes.	Healthy.
35	not much underground		A Trammer in shafts.	No. Yes.	Healthy.

APPENDIX 4.

AT RODDERUP FELL MINE.

Age of Miner.	At what age he began to work underground.	How many years he worked underground.	Whether he has ever suffered from any serious illness, and is now quite well. If not, of what does he complain.	Condition and Appearance.
30	20	10	No. Yes.	Healthy.
18	just commenced.	½ of a year	No. Yes.	Healthy.
62	15	47	Is a little "touched in breath," but generally enjoys good health.	Fairly healthy for age.
52	13 or 14	38 or 39	Short breathed, and especially when suffering from cold.	Fairly healthy for age.
22	9	3	No. Yes.	Healthy.
30	19 or 20	10 or 11	No. Yes.	Healthy.
21	19	2	No. Yes.	Healthy.
55	24	31	No. Not much "touched in breath."	Healthy.
50	15	35	No. "Not much touched."	Healthy.
23	20	3	No. Yes.	Healthy.
42	18	24	No. "Little short in the wind."	Healthy.
18	—	not a year	No. Yes.	Healthy.
39	18	21	No. Yes.	Healthy but pale and thin.
20	—	A year and a half.	Injured by stone in eye.	Healthy.
24	18	6 years.	No. Yes.	Healthy.
23	18	5	No. Yes.	Healthy.
20	18	2	No. Yes.	Healthy.
21	18	3	No. Yes.	Healthy.
35	20	15	No. Yes.	Healthy.
19	12	7	No. Yes.	Healthy.
23	19	4	No. Yes.	Healthy.
34	24	10	No. Yes.	Pale but healthy.
33	18	15	Had misfortune and laid by for 3 months.	Healthy.

WORKING AT SURFACE, BUT FORMERLY MINERS.

56	14	41	No. Yes. Gave up a year ago, now foreman of surface work. "A little short breathed. Worked sometimes in good, sometimes in very bad places.	Healthy.

APPENDIX 5.

AT ALLENHEADS.

Age of Miner.	At what age he began to work underground.	How many years he worked underground.	Whether he has ever suffered from any serious illness, and is now quite well. If not, of what does he complain.	Condition and Appearance.
36	15	21	No. Yes.	Healthy.
57	12	45	No. Yes.	Healthy for age.
36	7	29	No. Yes.	Healthy.
43	9	34	No. Yes.	Healthy.
53	15	38	No. Yes.	Healthy.
58	12	46	No. Yes.	Healthy.
34	11	23	No. Yes.	Very robust.
38	16	22	No. Yes.	Healthy.
47	14	33	No. Yes.	Healthy.
21	15	6	No. Yes.	Healthy.
33	14	19	No. Yes.	Healthy.
38	15	13	No. Yes.	Healthy.
22	15 or 16	6 or 7	No. Yes.	Healthy.
43	14	29	No. Yes.	Healthy.
18	15	3	No. Yes.	Healthy.
32	14	18	No. Yes.	Healthy.
23	20	3	No. Yes.	Fairly healthy.
36	15	21	No. Yes.	Healthy.
34	14	20	No. Yes.	Healthy.
38	16	22	No. Yes.	Healthy.
19	15	4	No. Yes.	Healthy.
18	8	10	No. Yes.	Healthy.
48	14	34	No. Yes.	Healthy.
27	20	7	No. Yes.	Healthy.
33	14	19	No. Yes.	Healthy.
39	17	22	No. Yes.	Healthy.
39	14	25	Rheumatic fever and rheumatic pains when 20 ys. of age.	Healthy.
18	12	6	No. Yes.	Healthy.
44	14	30	No. Yes.	Healthy.
34	16	18	No. Yes.	Healthy.
34	15	19	No. Yes.	Healthy.
22	15	7	No. Yes.	Healthy.
27	15	12	No. Yes.	Healthy.
56	19	37	No. Yes.	Healthy for age.
47	15	32	No. Yes.	Healthy.
18	13	5	No. Yes.	Healthy.
37	15	22	Ailing. Shortness of breath, &c.	Not healthy looking.
52	15	37	Poorly in early life, but well since.	Healthy.
40	18	22	Laid by with rheumatics a year ago, now well.	Healthy.
24	17	7	No. Yes.	Healthy.
27	23	4	No. Yes.	Healthy.
19	12	7	No. Yes.	Healthy.
27	16	11	No. Yes.	Healthy.
43	17	26	Inflammation of chest twice within last 4 years, attended by cough and spitting of blood, shortness of breath, &c.	Decidedly delicate looking.
23	14 or 15	8 or 9	No. Yes.	Healthy.
52	10	42	No. Suffers from shortness of breathing.	Worn looking.
44	8½	36½	No. Yes.	Healthy.
64	18	46	No. Yes. Says he has all his life been well.	Healthy for age.
45	19	26	Suffered 3 years ago from sciatica, and still more or less.	Fairly healthy.

APPENDIX 6.

AT Mr. BEAUMONT'S MINE, BURTREE PASTURE, COWSHILL, WEARDALE.

24	12	12	Yes.	Healthy.
20	14	6	No. Yes.	Healthy.
37	11	26	No. Yes. Has had pleurisy and rheumatic attack, and is not so very well now.	Healthy. Delicate.
37	9½	27½		
35	17	18	No. Yes.	Healthy.
40	17	23	No. Yes.	Healthy.
20	16	4	No. Yes.	Healthy.
23	16	7	No. Yes.	Healthy.
21	16	5	No. Yes.	Healthy.
23	11	12	No. Yes.	Healthy.
19	17	2	No. Yes.	Healthy.
46	16	30	Suffers in breath and from indigestion.	Worn.
30	19	11	Suffers "little bit in breath."	Worn, pale, and thin.
38	20	18	No. Yes.	Healthy.
25	8	7	No. Yes.	Healthy.
19	14	5	No. Yes.	Healthy.
16	6	10	No. Yes.	Healthy.
19	10	9	No. Yes.	Healthy.
41	14	27	Short breathed at times.	Worn and pale.
18	10	8	No. Yes.	Healthy.
19	14	5	No. Yes.	Healthy.
42	14	28	No. Yes.	Healthy.
26	18	8	No. Yes.	Healthy.
37	18	19	No. Yes.	Healthy.
57	7½	49½	Little short breathed.	Worn.
23	14	9	No. Yes.	Healthy.
28	18	10	No. Yes.	Healthy.
38	18	20	No. Yes.	Healthy.
26	12	14	No. Yes.	Healthy.
41	15	26	No. Yes.	Healthy.
28	18	10	No. Yes.	Healthy.
21	15	6	No. Yes.	Healthy.
24	18	6	No. Yes.	Healthy.
23	15	8	No. Yes.	Healthy.
17	Just commnced.	0		Healthy.
20	15	5	No. Yes.	Healthy.
25	13	12	No. Yes.	Healthy.
42	12	30	No. Yes.	Fairly healthy.
30	21	9	No. Yes.	Fairly healthy.
37	18	19	No. Yes.	Fairly healthy.
31	21	10	No. Yes.	Healthy.
22	19	3	No. Yes.	Healthy.
46	14	32	No. Yes.	Healthy.
41	20	21	No. "A little touched in the wind."	Healthy.
22	17	5	No. Yes.	Healthy.
20	17	3	No. Yes.	Healthy.
33	12	21	No. Yes.	Healthy.
43	8	35	No. Yes.	Healthy.
21	17	4	No. Yes.	Healthy.
48	20	28	Injured by blast 4 years ago. "A little short breathed."	
45	17	28	Nothing particular. "A little worse in health."	Healthy.
22	10	12	Had a misfortune and was crushed by fall of rock in mine.	Thin but healthy.
24	12	12	No. Yes.	Healthy.
35	14	21	No. Yes.	Healthy.
26	19	7	No. Yes.	Healthy.
20	17	3	No. Yes.	Pale and thin.
38	20	18	No. Little short breathed.	Healthy.
19	12	7	No. Yes.	Healthy.
20	11	9	Stated himself not to have suffered and to be quite well, but was pale, thin, and decidedly delicate looking.	
44	15 or 16	28 or 29	"Nothing particular. A little short breathed."	Healthy for age.
50	15 or 16	34 or 35	"Touched in wind."	Fairly healthy for age.
27	14	13	No. Yes.	Healthy.
18	10	8	No. Yes.	Healthy.
19	10	9	No. Yes.	Pale.
25	10	15	No. Yes.	Healthy.
12	10	2	No. Yes.	Healthy.
21	10	11	No. Yes.	Healthy.
28	10	18	No. Yes.	Healthy.
62	10	52	No. "Little short in breath."	Fairly healthy.
28	16	12	No. Yes.	Healthy.
20	10	10	No. Yes.	Healthy.
19	14	5	No. Yes.	Delicate looking.
23	16	7	No. Yes.	Healthy.
50	10	40	No. Little touched in breath.	Healthy.
36	17	19	No. "Rather short breathed."	Healthy.
61	11	50	No. "Breath not so good."	Healthy.
21	16	5	No. Yes.	Healthy.
50	15 or 16	34 or 35	No. "Short breathed."	Healthy.
32	8	24	No. Yes.	Healthy.
19	14	5	No. Yes.	Healthy.
23	10	13	No. Yes.	Healthy.
25	10	15	No. Yes. Bronchocle.	Healthy.
49	11	38	No. Yes.	Healthy.
31	18	13	No. Yes.	Decidedly delicate looking.
26	10	16	No. Yes.	Healthy.
18	11	7	No. Yes.	Healthy.
16	15	1	No. Yes.	Healthy.
48	7 or 8	40 or 41	No. "Rather not much touched."	Healthy.
60	10 or 12	48 or 50	No. "A little touched."	Healthy.
25	18	7	No. Yes.	Healthy.
18	11	7	No. Yes.	Healthy.
20	16	4	No. Yes.	Healthy.
16	14	2	No. Yes.	Healthy.
42	9	33	No. Yes. "Not much touched in breath."	Healthy.
33	13	20	"Nothing particular." "A little short breathed."	Healthy.
41	15	26	No. Yes.	Healthy.
55	8	47	No. "A little short breathed."	Healthy.
38	8 or 9	29 or 30	No. Yes.	Healthy.
45	11	34	Had a misfortune; fell down a sump seven fathoms. "Short breathed."	Healthy.
64	8	56	Lost an eye, but not in mines. "Short breathed, but able to work."	Healthy.
20	18	2	No. Yes.	Healthy.

MEDICAL REPORT

On Condition of Miners in North Wales. By Thos. B. Peacock, M.D., F.R.C.P., Physician to St. Thomas's Hospital, and to the Hospital for Diseases of the Chest, Victoria Park.

After being in the mining districts of the north of England, I visited the neighbourhood of Mold in Flintshire. In that district I was informed that the lead mines had been generally closed about 20 years ago, and the men employed in them had either gone to other occupations, left the neighbourhood, or died off. The newly opened mines had not been long in work. There are not therefore, at the present time, many ailing miners to be met with in the district, but the medical men who had been in practice for a sufficient length of time, were well acquainted with the different forms of affection to which the miners are subject, and through them I was enabled to see and examine three men who were suffering in this way. Two of them were old men, 56 and 77 years of age, who laboured under miners' asthma, in its most characteristic form, which they had contracted while working in the former mines. The third case was that of a man 30 years of age, who had been a miner only for two years. He was suffering from a feverish attack with bronchitis, which he ascribed to having taken cold at the surface, but he was apparently predisposed to consumption and in delicate health before he commenced to work under ground. The particulars of the cases of these men will be found in the Appendix.

At Minera I also examined 100 men whom I found at work. A considerable number of them had, however, only worked underground for a short period, so that they could not be regarded as fairly representing the condition of the mining population. Many of them also spoke only Welsh, and the informatron obtained through others could not be thoroughly depended upon. I have not therefore given the results of the examination of these men. The general impression produced by their inspection was, however, that they are a less robust race and less healthy than the miners in the north of England. Scarcely any of the men had commenced to work underground at a very early age, and many of them had become miners at somewhat late periods of life, and it struck me that those who had commenced only after having attained adult age, were especially delicate looking.

As regards the causes of disease among the miners, there was sufficient evidence that they correspond with those which have been shown to operate in Cornwall and the North of England. The recently opened mines are apparently generally well ventilated, though I was informed that in some places and at some times, the air was "dead or rather slackish" and that "choke damp" or carbonic acid gas was occasionally given off from the shaly strata. The defect was reported not however to be such as to prevent the men working, for the candles can always be got to burn, though they require to be sometimes much held on one side, "listed." No artificial system of ventilation is usually employed, except a fan occasionally, in "driving." The men enter and leave the mines as in Cornwall, by vertical shafts and ladders, but the workings are at present not so deep as to make the climbing very injurious to the men, though I was told that the ladders tried the men who were getting into years, and whose breathing was at all affected. Some of the levels are said to be very wet.

The older mines, from the information which was given me by the men whom I examined, must have frequently been in a very defective state. One of the invalided men stated that he was in a mine at Brongwyn on the 4th of September 1854, when 7 men were suffocated by choke damp. He said that the air of the mine was generally good, but became very defective about nine days before the occurrence of the accident, as shown by the candles being with difficulty got to burn, and only burning when they were held on one side. On the morning of the accident the men did not return at the changing time, and he was sent down to see what was the matter. On getting to the bottom of the shaft he found that the "damp" was in the mine, and with difficulty escaped, and was only got to the surface with the assistance of others. "He was not sleepy and knew everything that passed, but had no power in his limbs, could not take hold of anything, trembled all over, and could not stir." He was ill for a fortnight, and then got about again, but had never been so good a man since, his breathing being affected and his limbs weak. He, however, only suffered seriously after he had sustained an injury in 1856. He is now 56 years of age; his health first failed when 46 years of age, but he continued to work underground till two years ago. He confirmed the statement which was frequently made in the north that when the miners work in bad air their appetite fails, and they have pains in the bowels, and on leaving the mine "spit black stuff, or stuff as black as a cherry or bilberry."

Some of the smaller mines in parts of North Wales, which I did not visit, appear to be at present in a very bad state. A man, met with at Minera, a smith who had worked at his trade at different mines, said that at a small mine at Nantfrancon and at other mines in Carnarvonshire, the men suffered very much. "He had seen the men come up after working in such places, as if they were almost dying, and he supposed they might have died if they had remained below much longer. They would throw themselves on the ground quite spent when they first came up, but it would soon go off. The bad air affected them in their heads at first, and it took the power out of their limbs, and after working some time their wind became bad, and they were never fit for hard work afterwards. This was the case with the young men, more or less, but particularly with men who were getting a little into years." One of the medical men residing at Mold mentioned that formerly the miners were subject to lead colic. After special enquiries of practitioners in other lead mining districts, this assertion has not been confirmed. Both in Cornwall and the North of England the miners suffer much from symptoms of indigestion, pains in the stomach and bowels, and constipation or diarrhœa, especially the former. These symptoms are probably due to the cold and damp to which they are exposed, and to working with their feet in cold water. The bad air which they breathe also produces indigestion, and the symptoms have apparently no connexion with lead. In the neighbourhood of Mold, where coal is got on the spot, the ores were formerly in some instances smelted near the mines, and thus the miners may have occasionally worked as smelters, and so have suffered from the influence of lead.

Note in reference to the occurrence of fever in cottages at Maes y Safyn, near Mold.

At the Maes y Safyn mine, near Mold, I found that fever had been very prevalent. At the mine there are some very good cottages, with slated roofs, four large and high rooms; properly provided with privies, and underdrained, and with a passage at the back and a large garden in front. There are also other cottages which are extremely defective. They are small, thatched, huddled close together in rows, and generally consist of only two small and low rooms; the upper one in the slanting roof, and reached only by a ladder; the windows too are generally small, and usually do not admit of being opened.

These cottages are placed upon the side of a somewhat steep and rocky hill, with a rapid descent to a valley in front. Several of them have pigsties; none are underdrained; few are said to have privies, and scarcely any have any garden ground. From the mode in which they are built in two irregular rows, one behind the other, the drainage of the upper row sets down to the lower. At the time of my visit, streams of dirty water from the pigsties and dirt heaps were oozing across the foot paths in different places, and the ground around the cottages must be completely saturated.

There are about 35 to 40 of these cottages, and only 8 or 10 of the good ones; the rent of the former, without any garden ground, I was told was 3*l*. per annum, while the good cottages, with a large piece of garden ground, were only 4*l*. 10*s*. The total population of the hamlet is from 300 to 350.

Shortly before my visit there had been many cases of fever, but they had all recovered. Fever was prevailing in other parts of the district; and it was apparently introduced into Maes y Safyn from Gwernymynnyd, a village about 2 miles off in the road to Mold. It commenced first in a public house on the opposite side of the valley to the cottages; then appeared in the good cottages; and lastly in the bad cottages, and amongst them it continued to prevail for a long time. Altogether I am informed by Dr. Hughes, of Mold, that at least 56 cases of fever occurred, though only one proved fatal. The situation of the hamlet on the slope of a rocky hill in a somewhat shallow valley, affording every facility for drainage, without any elevated hills to prevent ventilation, is certainly a healthy one; but huddled together as the cottages are, wanting in every means of ventilation, and unprovided with any proper drainage, it would be scarcely possible to select a place in which fever would be more likely to arise spontaneously, or, if introduced, to spread.

MEDICAL REPORT

On the CONDITION of the HÆMATITE IRON MINERS in FURNESS, LANCASHIRE, by THOMAS B. PEACOCK, M.D., F.R.C.P.

In the month of March last I visited the district of Furness with the object of inquiring into the condition of the men employed in the Hæmatite Iron Mines. At the Parks Mine, in the neighbourhood of Dalton, I examined 93 men found at work, and at Dalton, visited 13 men who were either labouring under some form of indisposition, or were aged and had been employed in the mines for several years.

The general impression formed of the men whom I examined was, that they were a robust race and as healthy as men who are employed in other equally laborious open air occupations. Only a small number of the men had been engaged at the mines for any considerable length of time, the majority having recently commenced to work underground, and after having previously followed other occupations, most generally agricultural labour. In 13 instances, however, the men had worked at the mines for periods varying from 20 to 30 years, though two of them had been away occasionally. Of these 10 both appeared and stated themselves to be in good health, and though the other three were somewhat delicate looking, they were free from any serious disease; and all of them on inquiry stated that they did not suffer from shortness of breath, cough, expectoration, or other indications of the asthmatic affections which are so common among the miners in other districts. The results of personal observation were confirmed by the information received from others who had ample opportunities of judging, and who stated that the miners were or any healthy as the men employed in agricultural labour, fully as other pursuits.

Through the obliging introduction of Mr. Hall, who, as surgeon to the clubs in which most of the men are enrolled, attends a large proportion of the miners, I was enabled to visit several ailing and aged men. The inquiries which I made did not elicit any information which led me to suppose that the work in the mines exercised a materially injurious influence over the men. Indeed the only cases of sickness which fell under my notice were cases of accident, cold and influenza, disorder of the digestive organs, and scarlet fever,—that disease being prevalent in the district at the time.

Mr. Hall also informed me that he has not in the course of his practice, extending over 35 years, or from the commencement of the period in which the mines have been in active operation, observed among the men any particular tendency to bronchial or other forms of asthmatic affection, or any proof that they suffer at all seriously from working in bad air. He states that the only affections to which the men are liable are common colds, bronchitis, or pneumonia, and rheumatic affections,—diseases which are prevalent in the district generally, but to which the miners are more subject than the rest of the population, from their becoming tendered by working underground and occasionally in damp or wet places. Mr. Cranke, who, from his position as medical officer of the Lindale Moor Mines, has had great opportunities of observing the condition of the miners, in a letter with which he has favoured me, confirms the statements of Mr. Hall.

It thus appears that the mining population in the district of Furness are free from those affections which are so productive of disease and premature failure of power, in the men employed in the tin, copper and lead mines of Cornwall and Devon, the North of England and North Wales; and I have no hesitation in pronouncing them to be in a far better sanitary condition than any other set of miners whom I have examined.

The following circumstances appear to be those to which the more healthy condition of the Furness miners is to be ascribed:—

1st. *The mines are better ventilated.*—The men whom I questioned uniformly reported the ventilation of the mines to be good. The ironstone mines are only shallow when compared with the mines of Cornwall. A mine which is 80 to 100 yards in depth, is usually spoken of in the Furness district as a deep mine. The ore lies in the strata in masses often of great depth and extending over a considerable space, and the strata through which it is reached are generally easily penetrated, so that several shafts are sunk within a comparatively limited space, and the men have never to work at any great distance from an air vent. The drifts or horizontal shafts which are run at different levels to effect the removal of the ore, are of large size, and afford ample space for the passage of air. The various shafts also generally freely communicate, and thus adequate ventilation is generally maintained without the employment of any artificial means.

Formerly, however, when the mining was carried on on a smaller scale, the men had sometimes to work in bad air, and they are still occasionally subjected to the same, but only for a limited time, as in sinking shafts or driving, or when working in the bottoms of the mines, before the levels have been fully opened up by different shafts. That under these circumstances the air is occasionally unusually bad, is shown by the reports given by the men. Thus they state that sometimes the candles burn badly, that they can only be got to burn when held on one side, or cannot be got to burn at all. Under these circumstances the men say they suffer from loss of appetite, sickness, dizziness, shortness of breath, and prostration of strength, but they do not apparently work in air sufficiently bad, and for a period so long as to be materially or permanently injured by it. It is indeed only very occasionally and for a day or two at a time, and chiefly during close weather in summer or autumn, that the general atmosphere of the mines becomes defective. When this is the case an iron pan containing briskly burning wood is let down one of the shafts by a chain and is moved up and down for a short time. In this way an upcast current is usually soon caused in the shaft, and the movement of the air is sometimes assisted by throwing a small stream of water down one of the pumping shafts. It is stated not to be necessary to have recourse to any other method of promoting ventilation.

The ore which is obtained in the Furness district is usually in small or soft masses, and only requires to be worked by the pick, blasting being, in some mines, seldom required. The air of the mines is thus not rendered unwholesome by the presence of the products of combustion, and when "shots" do require to be fired, the ventilation appears generally to be so good that the smoke rapidly clears off. Of the men whom I examined, several had worked in Cornwall, and others in North Wales, the Isle of Man, and Ireland, before going to the Furness mines, and all agreed in stating that the air in the latter was much better than in the mines they had before been employed in.

2nd. *The men have generally only become miners after they are grown up, and have attained their full vigour.* It will be seen by the table in the Appendix that of the men examined at Parks Mine, who had worked underground at the iron mines for periods of one year and upwards, 67 in number, the mean period of commencement of work underground was 24·9 years; the extreme ages being 40 and 34, and 15 and 16 years. Most of these men had previously been employed as farm labourers, some few as quarry men, and others as navvies working on the railways. I specially inquired of the men who had worked in Cornwall what they thought was the effect of the employment of young boys in the mines, and they all stated their belief that it was a main cause of the premature exhaustion and failure of health of the miners, and that it was not necessary in order to make a good miner that the boys should begin to work underground before they are 17 or 18 years of age and are approaching their full vigour.

3rd. *The miners in Furness probably live better than in the other metal mining diltricts.* In Cornwall the miners live chiefly or pastry, bread, potatoes, &c. and get but little fresh animal food and usually only some bacon. This diet may be in part from choice, but the men often say that they cannot afford to purchase fresh animal food. I endeavoured to ascertain the wages of the men with the view of learning how far the last assertion is correct, but from the way in which the miners are paid "according to their bargains," and the deductions to which their earnings are subjected, it is difficult to make out what sums they on the average actually receive. Whatever be the cause, I certainly thought that the Cornish miners did not get so nutritious a diet as men following an occupation so laborious as theirs require.

In Furness the wages of the miners are good, averaging as far as I could learn, from 20*s.* to 25*s.* per week, and though the underground men are paid by the piece, the sums which they earn do not appear to vary much. They also live well, getting fresh animal food, at any rate several times a week, with bread, milk porridge, cheese, potatoes, &c., and they are certainly better nourished than the Cornish miners.

The men who had worked in Cornwall, North Wales, the Isle of Man, and Ireland, all said that they earned better wages and were consequently able to live better in Furness than where they had previously been employed. I was also told, both by the miners themselves and by other persons residing in the district, that the miners live better

than the agricultural labourers; and this was assigned by more than one independent observer as the reason why the miners do not suffer, as they might otherwise be expected to do, from working underground. I thought myself that such of the men as had been only recently taken on at the mines were less healthy looking than those who had been some time employed as miners; though this might be due either to the new men suffering from the occupation, or to the old men having improved in health from the more nutritious diet which they got.

4th. *Dust.*—Some of the men who had worked in other metal mines before going to the iron mines stated as one reason why they suffered less from working in the latter, was that there was less dust, and that the litttle dust which they breathe is not injurious to them. It is probable there is much truth in this remark. One man whom I met with, who had previously worked at the hæmatite mines, said that the men swallow the dust, and when they leave working "spit red," and that the red spit will be brought up when they have colds, even five or six weeks after they have given up working underground. The softer kind of ore is also very unctious, and adheres readily to the skin, and the ochery tinge once acquired is long before it can be got rid of. The iron may therefore very possibly enter the system, and being absorbed into the blood, may counteract the blanching effect which is generally produced by working in the dark. Certainly the Furness miners have not the anæmic appearance which is so characteristic of the men who work in the tin, copper, and lead mines in all the districts which I have visited.

5th. *Temperature—Wet.*—The mines are, as before stated, shallow, and being better ventilated do not become so warm as to interfere with the work of the men. They are, however, so much warmer than the external air that the men complain that they become tendered by working in them. Some of the pits also, and especially those which are old, and the lower workings or "bottoms" of most mines, are often more or less damp and sometimes very wet. It will be seen that both Mr. Hall and Mr. Cranke ascribe the colds and rheumatic affections to which the men are liable to the operation of these causes.

6th. The miners usually enter and leave the mines by ladders or "sties," as they are locally termed; but the mines are not so deep as to make the exertion of ascending and descending any serious labour, and I met with only one man who stated that the ladders tried him, and he was 57 years of age, had been a miner at intervals for 22 years, and was still working underground.

It would be premature to pronounce definitively as to the effect of the iron mining upon the health of the men employed in the work. The mines have not as yet been in full work for a sufficient length of time for any large number of workmen to be brought up as miners. The mines have been chiefly opened within the last 25 years, and there were few men of those whom I examined who had been at work over 20 years; and of those some had not constantly worked as miners. Indeed, the period of work of the 67 men who had been entirely employed in the iron mines averaged only 11·7 years, and the extreme periods of work were 30 and 28 years, and 1 and 2. The mean age of the men will also be seen to be 36·4 years, and the extreme ages 56 and 57, and 20 and 21. It is evident, therefore, that but few of the men have been employed in the mines so long as fully to test the effects of the work, and that they have not generally reached the age at which the miners become ordinarily seriously affected in health and strength. It may, however, safely be concluded, that if the occupation were materially injurious to them, the men would already show signs of failing power and impaired constitutions.

It is possible that the mines, though now so well ventilated, may become hereafter less so. At present they are only shallow, but in some situations the extreme depths of the deposits of ore have not been reached, and it may be necessary to sink much deeper shafts. If so, the facility of ventilation may be lessened, and the character of the air in the lower workings may become defective.

Notes taken in Furness.

Mr. Hall, Surgeon, Dalton in Furness.

March 26, 1864.

There are not at present many ailing miners in the district. Those who have recently been ill have suffered from colds and dyspeptic symptoms, and from scarlet fever, which has been prevalent. The miners do not suffer particularly from any form of disease, and are upon the whole as healthy as the agricultural labourers, or any other set of workmen. They complain a little sometimes of working in bad air, and then suffer at the stomach, but not to any serious extent. They have sometimes to work in wet places, the water dripping down upon them, and often ankle deep in water, and under these circumstances have colds and rheumatic complaints.

For the most part, the men have only been employed at the mines for a few years, and after they were grown up, and had been previously employed in agricultural pursuits. Some few of them may have been at the work all their lives; but they also do not appear to suffer more than men who work in the open air, and they are not particular subject to bronchitic or asthmatic affections.

The miners are usually well paid. Most of them work at piece work, and may get from a pound to 25*s.* per week. Others work at the surface on regular wages, and they earn about 18*s.* They live well, usually having fresh meat several days in the week, with milk porridge, potatoes, bread and cheese, and bacon; and many keep a pig.

The cottages inhabited by the miners are generally good. The are built in rows, of rough limestone, and are slated. They usually contain four rooms, and are properly underdrained, and provided with dusthole, privy, coalhole, &c. Many of the cottages have small pieces of garden ground attached to them, but others have none, though many of the miners rent allotments. The cottages are usually inhabited by only one family, but some have two. Some of the older cottages consist of only two rooms, and are very defective. The rent paid varies according to the situation and accommodation from 2*s.* per week, to 2*s.* 3*d.*, 2*s.* 9*d.*, and 3*s.*, paid monthly.

The men are generally in clubs, from which they receive medical and pecuniary relief in cases of sickness; and in cases of injury the proprietors generally provide medical attendance. In some of the mines there are clubs to which the men subscribe, and from which they receive 8*s.* or 10*s.* per week in cases of accident. Medical relief is only provided, however, in cases of accident; except at the Lindale Moor Mine, where a medical man is regularly engaged.

There are large newly erected National Schools at Dalton, which are partly supported by an endowment formerly devoted to the maintenance of a grammar school, partly by the proprietors, and partly by the children's pence. Some of the mine masters stop a portion of the workmen's wages for the support of the schools. There are also other National Schools in the parish, at Lindale, Ireleth, and Newbarns, recently built.

Iron mining has been carried on in the Furness district for many years, but it is only within the last 25 to 35 years that it has become important. When Mr. Hall first knew it, about 35 years ago, the only mine in work was that at Lindale Moor, and it only employed from 40 to 50 men, and often fewer. Now there are 400 to 500 men at work there. Mr. Rawlinson's mine, at Butts Beck, was the next opened; and that gentleman and other mine masters have opened others all around, employing a large number of men.

Mr. George Simpson, the Relieving Officer for the Dalton district, confirmed the report of the state of the miners given by Mr. Hall. He said that the miners were as healthy as the rest of the population, and he was not aware that there were any particular ailments to which they were liable from working underground. Both he and Mr. Hall said that they were generally a steady set of men, though some occasionally took too much ale. Many of them smoke a great deal.

Mr. Cranke, Surgeon, Ulverstone.

Letter dated April 2, 1864.

"I have been employed by the Lindale Moor Company for some years to attend their workmen; and from the experience I have had I conceive their men to be as healthy as the agricultural labourers, except that they suffer more from rheumatism in its different forms, and from chest affections; that is to say, common colds, bronchitis, and pneumonia. These, however, might be obviated by the use of woollen shirts during work, and change of clothing immediately afterwards. The men do not suffer, in consequence of their employment, from asthma and consumption. They are not subjected to the breathing of bad air to any great extent; but the mines are sometimes very wet. There is no dust. I am paid by the Company; and in case of sickness and accident a weekly allowance is granted to the sufferer from a fund in connexion with the mine."

Captain Hoskins, Park Mines, Dalton in Furness.

Went to work underground in Cornwall when only 11 years of age, and worked as a miner for 13 or 14 years. He worked at Wheal Caroline, in the Marazion district, and at East Crofty and at Carn Brea Mines. He never worked

for any length of time in any place where the air was very bad and did not suffer at all from it. He has been at work at the Furness Mines for the last 25 years. He considers these mines to be far better for the men than the Cornish mines. The mines are a mere nothing in depth compared with those in Cornwall, and although the miners inhale a small portion of dust from working in iron ore, it is not injurious to the constitution. In Cornwall the boys go to work much too early. They should not go before they are 18. When they go as early as they often do it is not giving them fair play, for though they say the boys only do boy's work, it is harder work for them than men's work. They must not, however, go to work too late, or they will never make good miners. Many of the men employed here, who have been farm labourers before, were too old for miners. In Cornwall they would be worth almost nothing. But if the boys go at 18 they are generally strong enough for the work, and are quite capable of becoming good miners.

The strata which the shafts have to be sunk through to reach the iron ore consist of clay and gravel, which is provincially termed "pindle." The ore is reached by shafts, which vary from 6 feet 6 inches by 5 feet wide to 14 feet by 8 feet wide. Vertical shafts are sunk so as to be within about 100 yards of each other. The drifts are run at various depths from 20 yards to 100 yards, and they are made 7 feet square. The shafts are of various depths, but they all communicate to the 80 yards level, and the deepest or drainage shaft is 120 yards deep. The men use ladders for access and egress.

The chief part of the ore is so soft as to be worked with the pick, and there is very little kidney ore at Dalton. When reached it is all taken away, and the roof is supported by wood, larch wood being preferred for the purpose; the crush is, however, very great, so that the wood is entirely crushed, and the ground settles. In some places the surface has sunk 30 feet in consequence. The whole space occupied by the mine is about three acres.

The mines are generally dry, and there is not much dust. Occasionally, but not often, in certain states of atmosphere, the air in the shafts stagnates, and cannot be got to move, and candles will not burn, and the men cannot work. When this is the case they let down a fire pan filled with wood, which is burning briskly, by a chain into a shaft, and move it up and down, and this creates an up-cast current. If the air was very bad the fire would not burn, but he never remembers an instance of its not burning. In addition to this it is sometimes necessary to force the current on by throwing a stream of water by the engine which works the pumps for draining the mines, for an hour or two in a day, according to the state of the weather.

There are two changing houses or "drys" at the Parks mine. These are provided with a supply of hot and cold water, and tubs for washing, with frames for hanging up the clothes used in the mine to dry.

No women or children are employed at the surface, as the ore does not require any picking, and is sent as raised to the furnaces.

There is a fund in connection with the mine, which is formed by each man contributing 4½*d.* per week. From this fund the miners receive 10*s.* per week in cases of sickness and accident, and all expenses of medical attendance, &c. in cases of accident.

Captain Hoskins's brother is also employed at Parks mine. He began to work underground in Cornwall when 12 years old, and worked at the Pen, Bertha, Croft, Wheal Neptune, Marazion, and Carn Brea mines. He has worked in bad air, and thinks if he had stayed in Cornwall he could not have lived till now, but would have died of what they call the "miners' consumption." He has now been in Furness for 16 years, and thinks the iron mines more healthy than the mines in Cornwall, and he considers this to be from the Furness mines not being so deep and more free from sulphur and powder smoke.

Statements of ailing and aged Miners, &c.

No. 1. Aged 53. Dalton in Furness.

March 26, 1864.

Went to work at the ironstone mines 16 or 17 years ago (or at the age of 36 or 37). He has worked at Mr. Kennedy's mines at Roanhead for the last 15 years, and at depths varying from 30 to 50, 60, and 80 yards. The men are let down and drawn up in cages drawn by an engine. The shafts vary in size; some are single, and are about 4 feet 6 inches by 6 feet; others are double, or from 6½ by 7 feet. The "roads" or "drifts" in the pit are about 7 feet high and 8 broad. When they get to the ore they take it all away, and prop up the roof with wood. There are several shafts coming to the surface. Generally the air is good, but sometimes there may be a little bad air in places. The smoke is away in a moment, but in some mines it may "lig in for an hour or two," but not when there are several engines at work.

Some of the men go to work at 3 a.m. and leave at 12, and then another batch goes down at 12 and comes up at 8 p.m. They do not often have parties working at night, and only under particular circumstances. The mines require to be pumped, but when the men work it is quite dry. There is not much "stour or dust" in the mines.

Some of the men who work at the surface of the mines have regular wages, and earn about 18*s.* per week. Those who work below are on piecework, and get about 20*s.*, 21*s.*, or 22*s.* a week, and sometimes more. They generally live well. He has cake or bread and cheese and tea at breakfast, and he takes tea with him to the pit. At dinner he gets fresh butcher's meat almost every day, or at least two or three times a week, with potatoes. In the evening he has potatoes and bread, and sometimes bread and milk. Occasionally he has a pint of beer, very rarely any spirit. He smokes about 3 oz. weekly.

He has had to work sometimes for a few days in bad air, but never in very bad, and that was when he first started, and not since he has been at Roanhead. The bad air is shown by the candles not burning well; the flame gets small, and sometimes the candle goes out, and then they have to leave work. The bad air "makes a body dizzy, and "just as if he was drunk and weak, and all of a tremble "in the limbs, and takes away his appetite, and makes him "sick whiles." It does not cause pain in the stomach or affect their bowels.

He has never suffered in the chest particularly, and his breath is good, and he has never anything the matter with his stomach. The dust has sometimes affected his breathing. He is still working underground. He is small, has a stooping gait, and is spare and sallow, but is healthy looking for his age.

No. 2. Aged 72. Dalton in Furness.

March 26, 1864.

Worked as a farm labourer till he was 23 years of age, and has been a miner for 30 years, but has not been constantly at work at the mines, being occasionally off for a year or two when trade was not brisk. He has worked for 11 years at Elliscales for Mr. Ashburner, and for 5 years for Mr. Rawlinson, and before that at Lindale Moor, but he was off occasionally, and cannot say how long he worked there.

The air is very good in cold weather, but sometimes it is bad in close muggy weather, and the wind affects the air in some mines; in his, the air is bad when there is an east wind. When the draught is good the smoke clears away rapidly, but if not you are almost poisoned by it. Sometimes he has worked when the air was very bad, and when the candles went out, "and then he became weak and all of a totter, your limbs would not carry you, and the sweat stands upon the face as big as peas," but they had then been in long enough and had to come out. The last time he was in air as bad as this was two or three years ago, but generally the bad air goes off in a few hours. He had "to give up working in the bottom, it affected his wind, and he now works at top when the air is good." "He believes it is still the same way if there are not proper roads and air vents. They are ill plagued till they get a road, and it may be for a month or six weeks. Sometimes they work both ways and try to meet it."

He gets the same wages as other miners, about a pound a week, and lives well. At breakfast he gets bread and butter, and takes coffee to the pit with him; for his dinner he has meat, fresh or salt, and at night he takes milk porridge. He has taken a good many pints of ale in his time, but little or no spirits, and he smokes. He has never had anything particular the matter with him in his life. "His breath is not good, but may be as good as most men at his age." He has a hard cough and some expectoration. The heart's sounds are flat, but without murmur; the pulse is feeble; tongue furred; appetite "middling," and the food he eats agrees with him; the bowels are regular. He is still in regular work underground, and is hale and strong for his age.

No. 3. Aged 73. Dalton.

March 26, 1864.

Has worked regularly at the ironstone mines for 14 years, and was employed at farm labour before. He first worked at Parks mine, and then went to Mr. Ken-

nedy's, and has been there for the last nine years. "He has almost always been in good air, but he has worked in bad for a chance time for a bit, may be for a fortnight or so." This has not been the case for the last two years. "The candles would always burn, but they burnt dull. The air did not at all affect him, and he has never worked in any very bad air. He earns about a pound a week, and generally gets fresh meat every day. He does not take much ale. His tongue is somewhat furred, pulse quick, does not complain of shortness of breath or any other symptom of indisposition, and is a stout healthy-looking man.

No. 4. Aged 30. Barrow.

March 26, 1864.

Has twice worked at Parks Mine. He first went there when he was a young man and worked ten months, and then left in consequence of the water breaking into the mine and four men being drowned. He afterwards went again for two years, and then left in consequence of a crush occurring and his mate being killed. It was partly his own fault; he was not materially injured; there were only two or three scratches on him; but he was smothered. He does not know that the miners are not as good men as the agricultural labourers, but they look pale. He is in a club in which most of the miners are, and he does not think they suffer more than others. He is also not acquainted with any sick miners, and he must have known it if many of them had been sick; and was not aware that they suffered from coughs, or were bad in their breath, or in any other particular way. They got better wages, and that enabled them to live better, which was favourable for them.

The miners breathe the dust of the ironstone, and when they leave the mines they spit red stuff. When they get a cold they spit red stuff a long time after they have left going to the mine. He did so fully five weeks after he had worked in the mines. The iron ore is of greasy nature, and it gets into their skin, and won't come out even with washing.

Generally the air of the mines is good; but sometimes it is bad, and the candles cannot be got to burn, and the men are unable to work. Sometimes also the candles don't go out but won't burn well, and then if the men continue to work they feel sick and all of a tremble, and have their breath stopped, and lose their appetite; but this is not often the case.

No. 5. Aged 33. Dalton in Furness.

March 27, 1864.

Has been a miner for eight years, and worked as a quarryman before. Since he has worked at the ironstone mines he has been at Mr. Ashburner's mine of Elliscales, and also at Mr. Kennedy's at Roanhead. In the last mine he worked in bad air twelve months ago for six months. It was at the pit bottom gaining the ore. It was 60 or 70 yards underground, and there was only one shaft, and they were driving about 10 or 15 yards from the shaft. The candles only burnt when they were held on one side, and then they smoked very much, and sometimes they went out. He felt "a little short in the wind at times," but he stood it well and did not suffer; but one of three others who worked with him complained one day of being "terribly dizzy." They did not use any artificial ventilation. Now there are two shafts, and the air is good.

Before he went to work at the mines, about twelve years ago, he lost one eye from an injury by a stick, and now he has had an accident by which he has injured the other eye. This accident did not, however, occur at his work in the mines. He has been off work in consequence of this accident some time, and has got out of health, and now complains of dyspeptic symptoms, flatulency, pain in the bowels, difficulty in passing water, &c. His tongue is clean, pulse weak but not quick; bowels regular. He is pale and delicate looking.

No. 6. Aged 3 Dalton in Furness.

March 27, 1864.

First went underground when nine years of age, and works a Roanhead at the present time. He has however been away at the quarries occasionally. He has never worked in bad air. The drift he works in is 26 or 27 yards underground, and the air is good, but sometimes the smoke does not clear away very quickly.

He has always enjoyed good health, except that he met with an accident in firing a shot in a quarry. He has earned various sums while at work as a miner, as little as 16*s.* and as much as 27*s.*, but generally 20*s.* to 22*s.* or 23*s.* per week.

He is now suffering from cold. Has a severe cough but not much expectoration; his appetite is defective, his pulse somewhat quick, and he is prostrated and pale; the bowels are confined except when he takes medicine.

No. 7. Aged 47. Dalton.

March 27th, 1864.

He worked underground for six or seven years, at Elliscales, but for the last 13 years he has been engaged at the surface as an engine-driver. He never worked in bad air except for about four days, and then it was nothing but what he could stand. He thinks that the cause of the failure of his health was his having worked in the pit's bottom where it was warm (but not warmer than an ordinary room) and that tendered him so that he readily took cold when at the surface. "All miners get a little tendered and are not so hardy as men that work out." "Some of the pits are dry and some wet, and the old pits have naturally more wet than the new ones."

He complains that he has been suffering for some time from pains in the stomach, and sickness and vomiting after food; but he is now free from sickness and altogether better, but he still has pain and flatulency. There is obviously some swelling and hardness in the liver and in the situation of the pyloric end of the stomach, and he is extremely thin and pale, and much prostrated. There are no symptoms of or signs of disease of the lungs or heart.

No. 8. Aged 39. Dalton in Furness.

May 27th, 1864.

A Cornish man. He first went to work underground at "Buckett's" mine between Redruth and Cambourne, near Carn Brea, and while there worked in plenty of bad air, what they call "cold damp." "The candles would sometimes only burn when "heeled," or two placed together, or placed behind them, but he was young then and did not suffer." He has been working at the ironstone mines for 17 years. Since he came here he has not had to work in bad air, except a little at times for a day or two, but never for any length of time. He considers the mines much better for the men than in Cornwall. "His father was a miner and worked in Cornwall for 50 years, and died when he was 67, but generally they can't work in Cornwall after they are 40 to 43 or 44; certainly the ironstone miners are the better men. There is not much dust in the ironstone mines, and they don't swallow it as they do the copper in the Cornish mines."

"Then the mines in Furness are not a tenth part the depth. It is a deep pit that is 100 yards, and where he is now working is only 20 yards. The drifts also are larger and give more air, and that is one of the things the men have in their favour. Here too, the mines all lie together, and they sink many shafts near together, some perhaps as near as 100 yards, others may be 200 or 250 yards apart, and then there are so not many men for each shaft. They could not sink shafts in that way in Cornwall; they could not afford to do it."

"The men also live better in Furness, for they get more money. For the last year he has worked at the surface, and gets 3*s.* per day for a week of six days, though the Saturday afternoon is a holyday. When at work below he got 4*l.* 4*s.* to 4*l.* 10*s.* and might get sometimes as much as 5*l.* per month, according to his bargain, but there is not the uncertainty about the work that there is in Cornwall. He thinks that this country is one of the best for working men."

He first went to work underground in Cornwall to do what they call "boy's work," but that is harder for them than the men's work for them, and going so soon must wear them out very quick. He thinks they would make just as good miners if they went at 16 or 18, as if they went at 10, but it is a great gain to a man to be able to take a son down with him. When he worked in Cornwall there were not so many boys at work as he understands there are now.

Since he has been at work in Furness he has been at Parks Mine. About a year ago he had erysipelas, and has not worked underground since, though he has been quite well and at work at the surface.

His present indisposition is only a cold which he has taken, and he has had a cough and sore throat, and lost his voice, but he is now much better. He is a small dark-complexioned man and is somewhat pale.

No. 9. Aged 57. Dalton in Furness.

March 11th, 1864.

He has been altogether a miner for 22 years. He went underground at 20, and has been away sometimes. When underground he has worked both in good and bad air, but never in very bad; though he sometimes found the candles would not burn but he has never known this for the last 10 or 12 years. He has lately been working for Mr. Ashburner at Elliscales. He has never had anything the matter with him but typhus fever—sometime back. He is still at work but the "sties" or ladders try his breath, though it is not generally bad.

No. 10. Aged 73.

Went to work underground when he was 23 years of age, but has not worked regularly ever since, having been away at times when times were bad and work slack. He has generally worked in "capital air," but about 17 years ago he worked in bad air. He has latterly worked at Mr. Rawlinson's at Cross Gates. He has never had anything the matter with him except that he broke his leg badly. He is very deaf.

No. 11. Aged 59. Dalton.

March 27th 1864.

Has worked as a miner for 10 years, and before that was an agricultural labourer; then they used to get about 12*s.* per week; now they get 18*s.* from the farmers. He had been working at Cross Gates for Mr. Rawlinson, and has sustained a compound fracture of the leg near the knee-joint from the fall of a large piece of rock.

No. 12. Aged 21.

Has worked as a miner for Mr. Ashburner at Elliscales for for 3½ years. He is now just convalescent from scarlet fever.

No. 13. Aged 41. Parks Mine.

March 26th, 1864.

Went to work underground at 18, and worked for 15 years in lead mines in the Isle of Man. When there he was occasionally in bad air; they then felt weak in the arms and legs, and it took away their appetite. They had to use the ladders to get to their work, and he worked at a depth of 195 fathoms. The draught was strong in some parts, but in others it was very slack. There were two shafts to the mine.

He considers himself altogether better off since he came into Furness, and thinks that the ironstone mines are in a better state than the lead mines in the Isle of Man.

Examination of Miners at Work at Parks, Hæmatite Iron Mine, Furness, March 26, 1864.

Age of Miner.	At what age he began to work underground and previous occupation if any.	How many years he worked underground.	Whether he has ever suffered from any serious illness, and is now quite well. If not, of what does he complain.	Condition and Appearance.

Mean age of 67 men who had been employed only in the iron mines and for periods of one year and upwards, 36·4 years.
Extremes of age, 56 and 57 and 20 and 21.
Mean age at which they commenced working underground, 24·9 years.
Extreme ages, 40 and 34 and 15 and 16.
Mean period of work underground, 11·7 years.
Extreme periods, 30 and 28 years and 1 and 2.

DISEASES OF MINERS

IN

CORNWALL,

THEIR FAMILY HISTORY, PERSONAL HISTORY, AND PRESENT STATE, WITH REMARKS.

BY

DR. PEACOCK, M.D., F.R.C.P.

DISEASES

District, Date, and Disease.	Present Age.	FAMILY HISTORY. Ages, Occupations, state of health and cause of death of brothers.	Age, occupation, &c. of father.	Ages, occupations, &c. of other relations.	PERSONAL. Age at which he first worked underground.	In what mines he has worked, kind of work, and character of air.
1. Camborne, July 13, 1862; Miners' Asthma and disorder of digestive organs, hepatic symptoms, diarrhœa.	47	- - -	- - -	- - -	16, but worked at the surface for 4 years before.	First worked at tribute at Dolcoath at 180 fathoms below adit for 6 years and then had good air. He then went to East Wheal Crofty and worked at tutwork there for 14 years. While there he worked in bad air at the 64 level for 4 years and 5 months. He returned to Dolcoath and has worked there ever since till he took ill. The air in Wheal Crofty was generally good, but he worked in bad air when sinking winzes and driving ends. He has also worked in shafts where it was very damp and draughty.
2. Camborne, July 13, 1862; Miners' Asthma and Dyspepsia.	40	- - -	- - -	- - -	At 14 or 15, worked at Stamps for 4 or 5 years before.	First worked at North Roskear for 16 months, then went to East Pool, and in both assisted the miners and pushed the barrows with the stuff. The air was bad at the latter mine. He went after, to West Wheal Seton, where he worked for 11 or 12 years. About 12 or 13 years ago he was engaged in driving an adit end at about 25 fathoms from a winze. The place was dry but it was very close, and he suffered very much in it; he felt fulness in the head and stupor, lost his appetite and had weakness in the knees and back in ascending the ladders; he worked at this a year and a half, and then left from want of work. He afterwards went to Camborne Vean but has never been well since, at the latter mine he was also in bad air sinking winzes. It was not hot. He worked 6 weeks and then got ill and was entirely laid by for 8 months, and has not been able to go underground since; since that he has been engaged at surface in landing and drawing up the "stuff" with a horse whim.
3. Camborne, July 13, 1862; commencing Miners Asthma.	25	- - -	Father worked at the surface at mines, and is still living and healthy at 60.	- - -	16	Has chiefly worked at Dolcoath at tutwork, and generally enjoyed good health, till he suffered at the chest from working in a hot place in which also there was much wet, 300 fathoms below the surface. He sweated greatly when down and drank water, and also passed water 3 or 4 times in small quantities.
4. Illogan, July 13, 1862; Phthisis.	36	- - -	Father was a farmer and died of consumption when 40 years old.	Mother living and healthy, had only one sister and she died of consumption.	21, worked at surface before.	He only worked 3 years underground, when he left from suffering at the chest, from working in wet and draughty places, but always had good air; he first felt pain and weakness in the small of his back and in the legs, without either cough, spitting, or beating at the heart. After 3 months he got better, but has never been so strong since. He returned to work, and again failed 7 or 8 years ago, and has had cough and spitting and weakness ever since.

OF MINERS.

HISTORY.	PRESENT STATE.					
Duration and assigned cause of illness.	General condition.	Nervous system.	Respiratory Organs.	Circulatory Organs.	Digestive Organs.	Remarks.
He ascribes his illness to having taken cold from working in draughts and draughty shafts at Wheal Crofty; when he was repairing a shaft, the water came down upon him for hours together as from a "griddle," and he worked there 4½ years. When he worked at Dolcoath he was in good health. His health first failed about 5 years ago, and he suffered from loss of appetite and diarrhœa, and was forced to lay by; he was away some time and then returned, and continued tolerably well till 2 or 3 months ago. His illness commenced with cough and expectoration, and inflammation of windpipe and chest; has never any rheumatic affection, but had cholera 7 or 8 years ago.	Dark complexion, turning grey, very sallow and freckled; stooping gait, highshoulders, lips very pale, eyes glassy.	Has suffered from vertigo but not from headache.	Very short breathed, and has cough, expectoration; some palpitation but less than he has had. The "spit" was dark coloured, but is now pale. Respiration short, 32, chest narrow, fallen in above and below clavicles, very slight movement especially at upper parts, vocal thrill somewhat exaggerated, resonance on percussion somewhat unduly clear, especially at left side, respiration everywhere very feeble, slight sibilus both with the inspiration and expiration on left side, inspiration feeble and expiration harsh and prolonged, respiration especially feeble at right apex, with undue cough and vocal resonance there.	Pulse 112, small and feeble, cardiac dullness natural, cardiac sounds feeble. No anæmic murmur in neck; external jugular on left side distended.	Appetite tolerable, food lies heavy at the stomach; bowels somewhat relaxed, and stools watery. Tongue morbidly red and coated with a thick fur at base. Hepatic dulness extending to nipple and into abdomen.	When working he states that he has earned from 3*l.* 10*s.* to 4*l.*, 4*l.* 10*s.* or 5*l.* per month, and he has a wife and 3 children to support. He rises at about ½ past 4 in the morning and gets underground by 6, having to get his breakfast and walk about a mile. He works underground for 8 hours. His breakfast consists of a cup of tea and bread and butter; he takes also some water and bread and butter underground, when he returns at 2 o'clock he gets his dinner, which consists of a mutton chop and soup and vegetables. He has seldom any beer with it, he thinks he may take about ½ a lb. of cooked meat a day and about a pint of beer, never any spirit unless he is not well.
Assigns the failure of his health to having worked in bad air, and especially at West Wheal Seaton, about 12 or 13 years ago.	Dark complexion, but with light eyes, sallow, spare.	No complaint.	Has spat some blood, not much cough, but occasionally suffers. The sputum is scanty and dark coloured; some shortness of breathing. Respirations 28, very little movement, resonance generally imperfect, vocal thrill natural, no cough res. Respiratory sounds generally feeble, especially at upper part of right side.	Pulse 72, somewhat feeble, cardiac sounds flat and feeble, 1st somewhat rough, no palpitation, no anæmic murmur.	Tongue morbidly red, some prominence in the epigastrium and tenderness on pressure, hepatic dulness natural, splenic dulness also natural, throat relaxed, uneasiness at the pit of stomach, and occasional vomiting of food, bowels always regular.	When working underground he got upon an average about 15*s.* a week, and lived upon bread and butter and a little meat, made in the form of pasty with dough, perhaps not ½ a lb. when cooked, he also takes milk, eggs, and vegetables. He sometimes does not take any beer for 3 weeks together, but on pay days has a little porter and sugar.
Has suffered at intervals at chest but better for last two years, till quite recently.	- - -	- - -	Pains across the chest and throat, but without cough or expectoration, respiration 32, respiratory sounds feeble expansion defective, vocal thrill natural, throat relaxed.	Pulse somewhat quick, 88, and feeble, never spat blood, heart sounds somewhat flapping.	Appetite and digestion impaired, tongue clean, bowels confined.	
7 or 8 years -	Sallow countenance and anxious expression, eyes glassy, stooping gait, phthisical looking and thin.	- -	Complains of shortness of breath, cough, and expectoration, and spits very thick mucus, respirations 20, feeble, dulness on percussion over the right side, very marked below and less so under clavicle, sub. crep. and cough res. over whole side, and less so on left; voice very husky; pat blood 3 years ago.	P. 92 feeble, cardiac dulness not extended, sounds feeble.	Appetite defective, pain at pit of stomach after food, griping pains in abdomen, bowels relaxed at intervals, occasional sickness with cough after taking food, tongue white.	He states that when working he used to get about 3 lb. of meat per week, with potatoes in the form of pasty, he had soup also sometimes, but not milk or eggs. He has not drank spirits, but generally gets a pint of beer on pay days or at other times.

District, Date, and Disease.	Present Age.	FAMILY HISTORY. Ages, Occupations, state of health and cause of death of brothers.	Age, occupation, &c. of father.	Ages, occupations, &c. of other relations.	PERSONAL Age at which he first worked underground.	In what mines he has worked, kind of work, and character of air.
5 Camborne, July 13, 1862; Dyspepsia.	67	- - -	- - -	- - -	At 15, and has worked steadily for nearly 52 years.	Has worked in various mines and generally in good air; he was last working in Tolcarne in poor air, and after working for 9 months was taken with an attack of griping and has not been well since.
6. Camborne, July 14, 1862; advanced Miners' Asthma.	57	- - -	- - -	- - -	12, and has worked steadily for 33 years.	Has worked in various mines and generally in good air, sometimes in bad; he gave up after 33 years because he thought he could do without it, and kept a beer-shop. Has not worked underground for 12 years.
7. Camborne, July 14, 1862; Miners' Asthma and commencing Phthisis.	52	- - -	- - -	- - -	At 11, and assisted the men to bring up the "stuff" till 15.	Has worked in different mines, chiefly at tribute and in good air; but when about 20 years of age he had "slow fever."
8. Camborne, July 14, 1862; Hemiplegia.	64	- - -	- - -	- - -	At 11 -	Stated that he had worked in different mines, but for the last 12 years not in any in which there was very bad air. He has, however, worked in dry and dusty mines, and says they are worse than wet mines. He has chiefly worked at tribute, but also at tutwork. He worked altogether for 48 years underground.
9. Camborne, July 14, 1862; Hemiplegia and aortic valvular disease.	51	- - -	- - -	- - -	Worked underground for 15 years, but did not state how long he had given up working and at what age he went underground.	Was employed as a "coacher," in pushing the trucks with stuff along the trams in the levels for 15 years, but never worked in particularly poor air or in close places; indeed "coaching," though harder work than that of miners, is generally done in good air.
10. Camborne, July 15, 1862; marked Miners' Asthma.	54	- - -	- - -	- - -	At 14, and worked for 13 or 14 years underground.	He has chiefly worked at tribute and generally in good air.

HISTORY.	PRESENT STATE.					
Duration and assigned cause of illness.	General condition.	Nervous system.	Respiratory Organs.	Circulatory Organs.	Digestive Organs.	Remarks.
Left work 4 months ago; working in poor air.	Thin and has lost 10 lbs. in weight recently.	- - -	Has no cough or expectoration, respiration feeble, res. on percussion natural.	Heart sounds feeble, pulse somewhat large but very compressible.	Complaining of want of appetite and heartburn, tongue white.	When working he did not get more than 2 lbs. of fresh meat per week, and not much milk, and had to live chiefly on bread and butter; he has taken little or no spirits, but some beer; he does not smoke.
Has been very asthmatic and unable to work for 12 years, and ascribes his indisposition to the irregularity in the times of taking his meals when a miner. His illness commenced with an attack of inflammation of the lungs.	Anxious countenance, pale, very marked difficulty of breathing, stooping gait, has always been temperate.	- - -	Great difficulty of breathing, aggravated at intervals, cough and expectoration, has spat blood several times, respiration puerile and with sibilant rhonchus in all parts. Chest morbidly res. at right side and dull at left.	Palpitation increased on exertion, heart sounds noisy, cardiac dulness extended.	Appetite and digestion defective, bowels regular.	
Gave up working 5 months ago; he worked last in East Pool at a close end where the air was bad. He was well enough while working; but after they had got through into the fresh air he took ill at once. He was taken suddenly 5 months ago with inflammation of the windpipe, and was compelled to lie by, and has not worked since.	Stooping gait, pale, thin, phthisical looking.	- - -	Complains of shortness of breath, cough, and spitting, and has spat some blood; chest very much contracted, very little movement, sparingly resonant especially on right side, and large veins on surface of chest; vocal thrill exaggerated at right side, especially at the apex, less than natural on left side subcrepitation, especially at right apex and more or less over whole chest. Counts to 30.	Heart sounds feeble, pulse 92 feeble. cardiac dullness not extended.	Appetite and digestion weak, sometimes coughs till he becomes sick.	He stated that when working he got about 3 lbs. of meat per week, which was made into a "pasty" with dough. He also took bread and butter, and about a quart of beer in a week, which he had done for 30 years, and never more than a quart at a time.
He was seized with an hemiplegic attack 5 years ago.	Paralysed on left side, and generally weak.	- - -	Breathing somewhat difficult.	No palpitation, heart sounds feeble.		
Had an apoplectic attack 6 months ago, and was left paralyzed in right arm, the leg is painful but not paralyzed; but his speech is so imperfect as to be unintelligible to those who are not accustomed to him. His power of deglutition is not affected. He had a similar fit 5 years ago.	Much stouter than miners generally are. Vacant expression of countenance.	Remains of paralysis on right side, especially of right arm. That arm cool; pains in corresponding leg, but no dragging.	Respiratory sounds and movements natural.	Pulse quick and free from thrill, loud musical murmur heard over the whole front and much of the back of the chest, but most intense at the upper part and the right side of the sternum. The second sound inaudible; has never suffered from rheumatic fever or pains.		
Gave up working underground from failure of health 25 or 26 years ago, and states that he was then thought to be going into consumption; he suffered from extreme weakness, with pain in the stomach and bowels and back, and "heaved up green corrupt stuff." His appetite was good. He had no cough and no expectoration. He was laid by for 4 or 5 months, and went to work at grass after, and has done pretty well since though suffering occasionally, and sometimes unable to work 3 or 4 months at a time. Has been engaged at a shaft in "landing." Has been worse for 3 or 4 years.	Spare, pale, sallow.	- - -	Bad cough with expectoration, and sometimes of blood, once brought up from a pint to a pint and a half at a time. Difficulty of breathing especially at night. Respirations 28. Very imperfect movements of chest, resonance on percussion somewhat unduly clear. Some crepitation at right apex. Throat relaxed.	Pulse 72 feeble. Heart sounds feeble, without murmur.	Complains of pain in the stomach and back, bowels somewhat relaxed, appetite defective, digestion fair.	Has always been temperate in his habits, never exceeded at one time a pint or two of beer, has very seldom taken any spirits. While he worked as a miner he had 4 or 5 lbs. of fresh meat in a week for a family of 6 or 7; sometimes had pork in addition.

District, Date, and Disease.	Present Age.	FAMILY HISTORY.			PERSONAL	
		Ages, occupations, state of health, and cause of death of brothers.	Age, occupation, &c. of father.	Ages, occupations, &c. of other relatives.	Age at which he first worked underground.	In what mines he has worked, kind of work, and character of air.
11. Camborne, July 15, 1862; commencing Phthisis.	37	He has lost brothers in early life.	Father a grassman, living, and in health.	Has lost sisters in early life.	At about 15, and worked for 22 or 23 years.	He has chiefly worked at tribute, and in good air. He was working in North Wheal Bassett when he got ill.
12. Camborne, July 1862; commencing Miners' Asthma; worn out.	47	- - -	- - -	- - -	At 11 or 12, and worked for 35 or 36 years.	Has chiefly worked at tutwork, and has frequently worked in bad air. He last worked in bad air at West Bassett in 30th, and also the 114th fathom levels. The mine was not hot.
13. Camborne, July 1862; advanced Phthisis and albuminuria: Dr. Harris.	21	- - -	Father died of miners disease between 60 and 62; he had worked in a very draughty place, and was ill, and suffered at the chest for 15 months.	Father's brother was a miner and met with an accident which injured his sight, he worked after above ground, and died after being 2 years ailing of an acute illness of 3 weeks duration. Another uncle died of consumption, and 6 of his children died of the same disease. A sister has died of consumption.	At about 16, and worked 2½ years.	He has worked at tribute, at North Roskear, for 2½ years and in good air.
14. Camborne, July 15, 1862; Dr. Harris, symptoms of Angina pectoris.	44	- - -	- - -	- - -	at about 17.	He has worked chiefly as a "sumpman," but also as a miner, and when so, at tribute and rarely at tutwork. He has latterly been engaged in "forking out" mines which have been abandoned, and were again in work. In his work he had plenty of air, indeed it has been in draughty places, but it is very wet work, and no clothing would keep him dry. He has latterly been working at a mine at tribute.
15. Camborne, July 15, 1863; commencing Miners' Asthma.	28	- - -	- - -	- - -	About 15, and worked as a miner for about 11 years.	Has chiefly worked at tribute, but occasionally at tutwork, and has sometimes worked in bad air and sometimes in very bad, when working in a close end. The mines in which he has worked in bad air, were Wheal Bassett, and Carn Brea, and the latter was the worst.

HISTORY.	PRESENT STATE.					
Duration and assigned cause of illness.	General condition.	Nervous system.	Respiratory organs.	Circulatory organs.	Digestive organs.	Remarks.
Enjoyed good health till March last, except that he had suffered from cold and had cholera 7 years ago. He was then sweating and very hot, and went into a wet place and got a chill. He has been laid by ever since he first got ill, and has tried several times to resume work, but has not been able to do so.	Dark complexioned, fairly muscular, pupils large, lips purple, delicate and phthisical looking, counts to 20, complains of general debility.	- - -	Complains of cough and expectoration, respirations 36, chest imperfectly expanded, especially at the upper part, and on the right side. Some deficiency of the resonance on percussion especially at the right apex, with bronchial respiration, cough and vocal resonance both before and behind; no rhonchus anywhere.	Pulse 92 feeble, and heart's sounds feeble.	Appetite and digestion fair bowels natural.	Has taken a pint of beer once or twice a week, and occasionally a glass of spirits. He has usually had 4 or 5 lbs. of animal food for a family of 3 or 4.
Enjoyed good health till about 7 years ago. When he got ill he was not working in bad air, but ascribes his attack to getting warm with working and then ceasing to work and being chilled.	Dark complexioned, old, looking, and complains of great weakness, rendering him incapable of working. Pale, sallow, very thin, and anxious looking.	Pain and lightness in the head, and occasionally has fallen down before going to work and after coming away.	Shortness of breath, little cough or expectoration, and never spat any blood. Imperfect expansion above and especially on the right side, respirations 32, feeble, especially at right apex, no marked cough or vocal resonance, throat relaxed.	P. 112, feeble, heart's sounds feeble.	- - -	He has not taken any beer for 3 years, and when he took it, it was never more than a pint at a time. He used to get 4 lbs. of fresh meat each week for a family of 7.
He has been ill since November 1860.	Fair complexion with reddish or auburn hair.	- - -	Advanced phthisis, with albuminuria and anasarca.			
Worked steadily as a miner till 6 months ago, and then left from suffering from his present illness. He thinks the dampness of his sump-work injured him, but he did not suffer till after he had given that up, and worked at tribute for 5 years. He has also had a fall of 5 fathoms in a shaft, 14 years ago, but does not think it injured him after the shock was over.	Moderately stout and healthy looking, says he has gained flesh since he has ceased to work underground.	No complaint	No signs or symptoms of disease of respiratory organs.	Complains of very severe pain, which he first experienced when coming out in the morning; the pain is felt behind the top of the sternum, and extends through to the back, and down the arms to the elbows, and especially on left side; when it comes on he has to stop immediately, and after a little while it goes off. He does not feel faint at the time, and has never had any fit or insensibility. The pain is still very severe when it comes on, but he can now "fight it off;" cardiac sounds very loud, no murmur, pulse regular but feeble, equal at wrists, no morbid pulsation or deficiency of res. on percussion.	No complaint.	He has always been a very temperate man, not more than a pint of beer in a week, and a glass of spirit in a month. He has usually about half a pound of fresh meat per day, and has lived chiefly on bread and butter.
Worked steadily and enjoyed good health, till 12 months ago.	Great general weakness, especially felt in climbing ladders; very sallow.	- - -	Complains of tightness across the chest, with cough, but without much expectoration. Pain also in chest, respirations 28, chest generally sparingly res. and respiration feeble. Vocal thrill less distinct on left side. Throat relaxed.	Dyspnœa, especially in climbing ladders; pulse 72, very feeble. Heart's sounds feeble.	- - -	He has rarely taken any beer, not more than 2 quarts in a month. He has usually had about 3lbs. of fresh meat in a week for himself and 5 others.

District, Date, and Disease.	Present Age.	FAMILY HISTORY. Ages, occupations, state of health, and cause of death of brothers.	Age, occupation, &c. of father.	Ages, occupations, &c. of other relations.	PERSONAL. Age at which he first worked under ground.	In what mines he has worked, kind of work, and character of air.
16. July 17, 1862; Miners' Asthma, slight mitral defect, false cartilage in knee joint; general debility.	61	- - -	- - -	- - -	At about 27 years of age; worked as a farm labourer in early life.	He has worked in United Consols and Jewell mines in Gwennap, where it is very hot, especially in the 80, 100 and 200 fathoms levels in United mines. In the lower workings, it is so hot that the men work naked, and though the water is hot, they throw themselves into it. He also had to climb the ladders after working, and was often so exhausted by it, that he could not speak on coming to the surface, and his heart beat violently. They work for spells of 6 hours, but it is so hot, they can only remain in the hot places for an hour or an hour and twenty minutes; they then come out and fire the blast, and wait for $\frac{1}{4}$ of an hour or 20 minutes till the smoke clears away, and then go to work again. They drink only water when below, and sweat profusely, and pass but little water. They smoke when they are resting after the blast. The mines are also dry and dusty. After working in the mines, they spit quite black stuff, and the smoking helps them to bring it up.
17. Camborne, July 17, 1862; advanced Miners' Asthma, Emphysema pulmonum.	50	He has 6 brothers; 1 of them is working as a miner in America, and 1 is living at Camborne, and was a miner, but is in worse health than he is himself.	Father a miner, and died at 65 of asthma.	Mother died at 65 of natural causes. A sister died of asthma and rheumatism at 30.	At 15 or 16, and worked about 35 years.	He has chiefly worked at tutwork and at Stray Park, and usually in good air; has worked in bad air, and especially for 3 months at Camborne Vean, 12 or 14 years ago, but states that he did not suffer materially at that time. He has been last working at tribute at Stray Park, and in good air.
18. Camborne, July 17, 1862; Miners' Asthma.	33	Brothers who grew up are all living and healthy.	Father worked at mines on surface, and died at 50.	Sisters who grew up all living and healthy.	At 14, and has worked ever since.	He has worked almost always at tutwork driving shafts, and generally in good air. He has worked at North Wheal Crofty and at Stray Park. In the last mine he worked in bad air 5 months ago. It was about 160 fathoms from grass, and a long way down from the shaft, and "the air was so bad candles would not burn except when held on one side and the wick pulled out, and then they made a great smoke, and they would sometimes go out entirely, and good matches would not take light when struck 3 or 4 times over. There were no "deads," but there was no air. The mine was cold and very wet, and they had much wet to go through to get to their work." He worked there 3 months and then had to give up from bad health. There were 4 other men working with him, but all had to give up several times, but he kept on till at the end of 3 months he broke down entirely, and after a time went to another mine, Crane, where he is now on tutwork.
19. Redruth, July 17, 1863; Mitral valvular disease.	31	- - -	Father formerly a miner, but has not been underground for 30 years, and is still living, but discontinued mining from ill health; since that his health has improved.	-	At about 15, and worked as a miner for 15 years.	Has been for a year and a half in America, and worked in the "Amenable" coppers of Lake Superior, and returned about a year and a half ago. He has chiefly worked at tribute, and worked in foul air before he went abroad.

HISTORY.	PRESENT STATE.					
Duration and assigned cause of illness.	General condition.	Nervous system.	Respiratory Organs.	Circulatory Organs.	Digestive Organs.	Remarks.
He enjoyed good health till 20 years ago, when he got sciatica and was laid up for 15 months, from taking cold. After that he has not suffered in the same way, but has not gone underground since. He has since worked as an engineman at the "sump shaft." He is now suffering from an affection of the knees which came on suddenly from his spraining himself very slightly in stepping aside to avoid some persons when he was walking. He felt something crack in his knee, and has been incapable of walking much since.	Pale and thin, and very weak. Never had rheumatic fever or rh. pains.	Suffers from lightness of head.	Chest narrow and contracted, movement slight, vocal thrill feeble, res. on percussion impaired, respir. somewhat harsh, dyspnœa on exertion.	Suffers from palpitation, increased on exertion, first sound prolonged at the apex, and second sound somewhat ringing. Cardiac dull space extended.		He states that he has always lived temperately, having only had a pint or 2 pints of beer once or twice a week, and sometimes not at all for a month. He generally took it on pay nights, when he had to go to the public house to get his note cashed; sometimes also he took a little brandy or gin. He has had about 2 lbs. of meat per week in the form of pasty. He has also taken milk, but chiefly bread and butter.
Has not been able to do anything for 3 months, but was ailing; short breathed and very liable to take cold before that. His first attack came on after washing one morning at 3 o'clock in cold water, when he came from the mine.	Face very sallow, expression of countenance anxious; eyes pale; lips livid; stooping gait. He has never had rheumatism or any serious disease, but about 20 years ago fell 12 fathoms, but did not suffer after he had got over the immediate effects. Dark complexioned.		Complains of shortness of breath, cough, and spitting. The spit was at first sometimes quite black. It has also been sometimes bloody, but is now white. Respirations 36, short and imperfect; large veins on chest, movement very imperfect. Vocal thrill fair at right but defective on left side. Respiration attended with subcrepitation on the right side, and especially at the upper part; no marked cough resonance; very feeble on left side; counts to 18; throat relaxed.	Pulse 88 very feeble; heart displaced downwards; cardiac sounds extremely feeble; does not suffer from palpitation.	- - -	He states that he has always lived regularly; has taken a quart of beer once or twice a month, and sometimes a little spirit. He has had about 3 lbs. of fresh meat per month, and has lived chiefly on bread and butter, and milk, and eggs.
He is still working, but says that he suffers much at the chest, and ascribes his illness to having worked in bad air 5 months ago.	Spare, sallow, with stooping gait. Has a scar from an injury of the shoulder 5 years ago.	- - -	Respirations 28, irregular and laboured; chest sparingly resonant on percussion; very defective movement, and vocal thrill very feeble; sonorous rhonchus with inspiration and expiration in all parts, and especially in dorsal regions; counts to 20.	Pulse 72, very feeble; cardiac dulness somewhat extended. Heart's sounds feeble. States that he has had much ladder work, having to go up and down from 150 to 200 fathoms; now has 150.	Appetite and digestion bad. Bowels regular.	He states that he has always been temperate, and has taken a pint of beer once, twice, or three times a week, sometimes a little spirit. He has usually got about 2 lbs. of butcher's meat per week. He smokes, for it helps to get up the "corruption."
Has not been able to work for 7 months. His health failed before he went to America, but he got worse while there, when working at a 15 fathom level. Three months after he vomited blood.	Fair condition. He states that he had swelling and erysipelas of the hands before he got ill, but denies having had decided rheumatic fever or swelling of the ankles.	- - -	Dyspnœa encreased on exertion.	He labours under symptoms of disease of the heart, and there is a slight systolic murmer, audible chiefly at lower part of sternum and about the middle and on the right side of that bone; more feeble at the upper part of the sternum, second sound flat. Pulse quick, somewhat vibratory; palpitation and vomiting of blood.		

District, Date, and Disease.	Present Age.	FAMILY HISTORY. Ages, occupations, state of health, and cause of death of brothers.	Age, occupation, &c. of father.	Ages, occupations, &c. of other relatives.	PERSONAL. Age at which he first worked underground.	In what mines he has worked, kind of work, and character of air.
20. Redruth, July 17, 1862; Miners' Asthma, with slight mitral valvular disease.	49	He has 2 brothers, miners, both of whom are living and healthy.	Father a miner and died at 49 of miner's complaint, after having been ill for 6 years. Father's father a miner, and died between 70 and 80 of old age. He left work 10 years before his death, though not from any illness at the time. Mother died of dropsy at 60. Father's sister died of asthma at 70.	Father's brother also a miner, and killed by a fall of stuff.	At 14, and worked steadily till he gave up, 20 years ago. He has worked as a miner 15 years.	He has chiefly worked at tutwork, and has "worked in very bad air, when the candles could not be got to burn unless placed about 9 feet behind where they were working, or by teazing out the wick, and holding the candle on one side, and then there was a great smoke, and when he came up, what he spat was as black as ink." About 5 years before he left working underground, he had inflammation of the lungs with blood spitting, which came on when he was working in "poor air" and "cold damp," and he has never been well since. He worked at the 5 consolidated mines, copper; he worked at the different levels, from the adit to the 160 to 210 fathom. The mines were dry, and dusty, and hot, but he has also worked in cold and wet mines.
21. Redruth, July 17, 1862; Miners' Asthma; passed blood by stool.	42	Brothers all living except one, who was killed.	Father a miner, died at 65, and worked till 4 or 5 months before his death.	- -	At 20, and was engaged at the dressing floors before.	Has chiefly worked at tutwork, and has worked in bad air.
22. Redruth, July 17, 1862; Phthisis, without family predisposition; acquired by working in bad air.	32	The family originally consisted of 11, of whom only 6 besides himself grew up. One brother was a miner and died at 39, after an illness of 5 months; four others are miners and living, but one is very ailing and "was given up five years ago as in a decided consumption," but after a time he passed a large worm and got much better, and is now able to work a little at surface.	Father a mechanic, and living at 81.	He has several paternal uncles living and healthy, a brother of his mother was a miner, and died of cholera. Mother living at 74, he has a sister living, a maternal aunt is living at 70, and 2 paternal aunts between 50 and 60.	At 9 or 10; at first he drove a machine for blowing air to the men 50 or 60 fathoms from the surface; became full miner when about 12.	He was last working at tutwork at a "rise" in New Clyjah mine at 40 fathoms from the adit (the adit running from 28 to 40 fathoms,) and about 100 from the shaft, "in very bad air, where, indeed, they got no air but what was blown to them, and only a puff now and then. When first they went in the morning the candle could not be got to burn, and they took off their coats and beat the air about and then went into the level, and after a time returned, when the candles could be got to burn, but only by holding them on one side; sometimes the lucifers could not be got to take." He worked in this place for 3 months, and then they sank a "winze" to join the rise for a month, and after that for a month they drove straight on; altogether they had worked 5 months when he was taken ill with pain in the side. He continued to work for a fortnight, and then knocked off entirely.

HISTORY.	PRESENT STATE.					
Duration and assigned cause of illness.	General condition.	Nervous system.	Respiratory organs.	Circulatory organs.	Digestiv organs.	Remarks.
He has been entirely laid by for about 7 years, but ceased working underground 20 years ago from failure of health from working in poor air, and cold damp and wet. He had then been ailing for 5 years. He also states that the ladders tried him and the exposure after being heated; soon after he left work he had dropsy, he still finds his feet occasionally swell when he is suffering from cold. When he first left working underground he was told he was in an advanced consumption, and for about 9 months he was very ill and nearly confined to bed. After another 12 months he was able to work on the roads, and he has done light work, since, till 6½ or 7 years ago.	Stooping gait; dark complexioned; sallow; anxious looking. Height 5 ft. 6¾ in. Formerly weighed 9 stone, but now only 6 st. 14 lbs.; eyes pale.	Complains of headache.	He complains of shortness of breath, and pain on the left side, increased on exertion, and cannot draw a full breath. He has also a very bad cough and much spitting, especially in the morning; it is yellow or dark coloured, and very difficult to get up. Respirations 28; very imperfect expansion, and especially at upper part of chest; large veins on surface of chest sinking in above the clavicles; very slight movement; respiration chiefly diaphragmatic; vocal thrill very imperfect, especially below; chest sparingly res. on percussion above and at the right apex, both before and behind; deficiency of the res. on perc. also, low down at the left back and side; loud sonorous and sibilant rhonchus in all parts of chest, and especially at upper part of right side, both before and behind, and at lower part of left side and back, where also there is some subcrepitation. Cough res. undue at right apex, and increased vocal thrill there.	Pulse 80, very feeble; cardiac dullness increased in extent. Palpitation at all times, but much aggravated on exertion; cardiac pulsation visible to the left of the zyphoid cartilage. The first sound of the heart is noisy and prolonged, attended with a slight murmur. The second sound flat.	Appetite very defective, and bowels confined; digestion fair; hepatic dullness extending nearly to the nipple; tongue furred.	He states that when working as a miner, he used to take about 3 quarts of beer per week, and sometimes more on pay-days. He also sometimes took spirits. He had about 2½ pounds of fresh meat per week, and took it with bread and potatoes, in the pasty.
His health failed 3 years ago. He ascribes his illness to having taken cold when sweating from working in a hot place, in coming through cold water on his way to the shaft. He had previously been working in bad air where the candle would not burn without being held on one side, and sometimes without being placed behind him; occasionally the candle went out, and the lucifers would not take. He was first seized when in bed one morning with a violent shivering and symptoms of bronchitis, and was laid by for 8 months.	Facelivid, high shouldered; anxious countenance.	- -	Has not spat blood, chest narrow and contracted, and especially above, and very little movement with the respiratory acts, vocal thrill slight. Chest everywhere sparingly resonant, but especially on the right side. Loud inspiratory and expiratory sounds both before and behind, no rhonchus, but some cough; res. at right apex both before and behind. Counts only to 6 or 12. Breathing and cough not worse during last 6 months.	Heart's sounds somewhat noisy.	Has passed much blood by stool, and has had much pain in the bowels.	He was a teetotaller for some years before he got out of health. He took about a pound of meat per week, and lived chiefly on bread and butter.
Left working underground 17 months ago, and was quite well and strong a month before that. He ascribes his illness to having worked in very bad air in a "rise," and afterwards in a "winze" and "close end. He was first taken with a pain in the right side, shortness of breath, cough and spitting, and occasionally of blood, and he has got worse ever since.	Height 5 feet 6, weighs now 6 stone 14, before his illness weighed 8 stone 4. Pale and moderately stout, not much sweating at night. Has lost his right eye "by a stone flying against it."	- -	Chest wide, respiratory movements imperfect on right side. Respiration chiefly diaphragmatic; vocal thrill natural. Some falling in at right apex, with dulness on percussion over a large space there and bronchial respiration and subcrepitation without marked cough res., but with exaggerated vocal thrill. Sputum muco-purulent and bloody. Signs less marked at left apex. Respirations 32. Cavernous sounds at right upper mamary region. Counts to 24.	Some little palpitation, and especially when in bed. Pulse 120.	His appetite is "middling, but he cannot get proper food." Bowels confined. Digestion fair.	When working he used to get about 2 lbs. of fresh meat per week, and spent about a shilling a month in beer, chiefly on pay days. He states that "as far as he knows none of his family had anything the matter with their chests, except they were miners."

District, Date, and Disease.	Present Age.	FAMILY HISTORY. Ages, occupations, state of health, and cause of death of brothers.	Age, occupation, &c. of father.	Ages, occupations, &c. of other relatives.	PERSONAL Age at which he first worked underground.	In what mines he has worked, kind of work, and character of air.
23. Redruth, July 17, 1862; Paraplegia, from cold.	50	- - -	- - -	- - -	At about 17 or 18, and worked at surface for 5 years before that.	- -
24. Redruth, July 17, 1862; commencing Miners' Asthma	46	He has two brothers miners, one in California, the other in Australia.	Father was a farmer, and died at about 70.	Mother living, and above 70.	At about 18	He has been almost always engaged in working at tribute, and never worked in poor air for the last 20 years; but before that worked for 3 months in bad air at Carn Brea.
25. Redruth, July 17, 1862; probably Interlobar Pleural Abscess on left side, opening through the lungs.	48	- - -	- - -	- - -	At about 15 or 16.	He has chiefly worked at tribute and never in bad air for the last 10 or 12 years.
26. Camborne, July 19, 1862; slight Cardiac disease, probably mitral, sequence of rheumatic fever.	36	The family originally consisted of 12, and only 5 are now living, 1 brother died at 26, the others died in early life.	Father a miner and died after an injury at 53.	Sister died at 23.	At 17 -	Has chiefly worked at tutwork in sinking shafts and generally in good air. He last worked in Great Wheal Vor; part of the shaft was very wet and cold. He has worked at a depth of 335 fathoms and had to climb the ladders all the way.

HISTORY.	PRESENT STATE.					
Duration and assigned cause of illness.	General condition.	Nervous system.	Respiratory organs.	Circulatory organs.	Digestive organs.	Remarks.
Has been entirely laid by for 1 year and 7 months, but has been ailing for 7 years. He ascribes his illness to having worked 7 years ago in a level where there was a great quantity of water. It was a tin "mine, in the granite and very cold, and the adit was stopped up and the levels by "deads" or "attles," so that he was half-leg deep, and was not using much exertion at the time. He worked for 7 hours, and then when he came out felt as if he had been beaten with sticks, and in 2 or 3 days his limbs became dead and numby and he was hardly able to move them, but could feel a little." He got worse for year.	- - - -	Lower extremities, and especially the left, very numb, and very little power of moving them; arms not affected; great weakness also in the loins. Has also had difficulty of passing water and stools, but is now better in those respects.	Respiratory sounds feeble.	Heart's sounds natural.	- -	Health otherwise good.
Gave up work about a year ago. He states that 12 years ago he had inflammation of the chest brought on by putting on after working, the clothes in which he had walked to the mine in the rain, and which were still wet. He has never been quite well since, and readily takes cold. Has never had rheumatic fever.	- -	He suffers from difficulty of breathing, but has no cough or expectoration. Surface of the chest, especially on the left side, tender to the touch, very little movement, vocal thrill feeble, respiratory sounds very feeble. Dulness on percussion and absence of respiratory sounds at the lower part of the left side, some deficiency of the res. on percussion and of respiration at the upper parts of chest.	- - -	Fluttering at the heart, cardiac pulsation visible to the right of the false ribs in the epigastrium. Heart's sounds extremely feeble.		
Left work 12 months ago in consequence of suffering from pain in the left side and shoulder. The pain commenced suddenly; he went to bed quite well on Sunday night and was taken ill at 5 o'clock on Monday morning. The pain was followed rapidly by shortness of breath, cough, and expectoration, and he was nearly confined to his bed for 6 or 7 months. After 6 or 7 weeks he spat a quantity of matter which came up suddenly after a severe fit of coughing; he usually lay on the left side, and if turned over on the right side he immediately became nearly choked by the cough. At first what he spat was bloody and very offensive and then it declined in quantity and became trifling about 4 months ago, and he has greatly improved in health since.	- - - -	- - -	Respirations 28, general impairment of expansion in all parts of chest and deficiency of res. on percussion and of respiration, especially in left lower lateral and dorsal regions. Deficiency of resonance and of respiration also in right dorsal region, counts to 30.	Pulse 88, cardiac dulness natural, heart sounds noisy, pulsation very visible to right of false ribs in the epigastrium.		
Had quite good health till 4 years ago, except that 12 years ago he had an inflammatory fever, from which, however, he entirely recovered; he has been unable to work for 6 weeks. He ascribes his illness to having put on, after working hard and getting heated, the clothes which he wore on entering the mine and which were wet from having been left in a wet place when he began to work.	Great debility	- - -	He complains of shortness of breath, increased on exertion; dry and hard cough, spitting scanty, sometimes black, never bloody. Respiration 24, very little movement, deficiency of res. on percussion on right side, and very feeble respiration.	First sound of heart prolonged, pulse 72 feeble.	Want of appetite.	

District, Date, and Disease.	Present Age.	FAMILY HISTORY.			PERSONAL	
		Ages, occupations, state of health, and cause of death of brothers.	Age, occupation, &c. of father.	Ages, occupations, &c. of other relatives.	Age at which he first worked underground.	In what mines he has worked, kind of work, and character of air.
27. Redruth, July 17, 1862; Phthisis, family predisposition.	30	All his brothers are living.	None of his relatives have been miners, 2 of his father's brothers were masons and died of consumption.	His father is living and healthy. A sister died young. Mother living and healthy. An aunt of his father's side died of consumption.	At about 15	He stated that he had for the most part worked at tribute and in good air. But he worked in poor air driving an end at West Bassett.
28. Camborne, July 19, 1862; Mitral valvular disease and dropsy. Dr. Harris.	21	Never any brother.	Father a miner aged 47, and healthy.	Mother living and healthy; 6 sisters all living and healthy.	At 13, and has been a miner for 8 years, but did boy's work for the first 2 years.	He has chiefly worked at tutwork driving ends, and has worked in poor air where the candles would not burn, and the smoke after blasting lay about for from 2½ to 3 hours. The air was very bad when he went to work in the mornings. He has never sustained any severe injury or had rheumatic fever. He has worked at Camborne Vean, Wheal Frances, and Wheal Harriet, and last at North Crofty.
29. Camborne, July 19, 1862; advanced Phthisis, with hereditary predisposition. Dr. Harris.	44	Has 2 brothers both living and healthy, at 37 and 40 and both miners; one retired; the other still going underground.	Father was a farmer's labourer and died at 26 of consumption.	His grandfathers and grandmothers lived to 78 or 80. Mother died from effects of an injury at 60. A paternal aunt living at 64. 2 maternal aunts and uncles now living about 60.	Went down at 17, and worked regularly till he was 35. Became a captain 9 years ago.	Has worked chiefly at tribute and generally in good air, but has worked in a little bad air but not for many years.
30. Par, July 1862; Dyspepsia, slow fever.	37	Brothers all living.	Father, a miner, was killed in a mine when 30 years of age.	Mother living, sisters all living.	Went down at 16, and worked at grass after he was 7½.	He first worked at Par Consols at tutwork, in driving an end and there had good air; he left in 9 years and went to Fowey Consols, and has latterly worked chiefly as a tributer and generally in good air.

HISTORY.	PRESENT STATE.					
Duration and assigned cause of illness.	General condition.	Nervous system.	Respiratory organs.	Circulatory organs.	Digestive organs.	Remarks.
He thinks his health failed from working in bad air and getting cold. After leaving West Basset he tried another mine, but could not get on. He was first taken with sickness and vomiting in the evenings after returning from work, then got cough and expectoration and afterwards spat some blood and his health became affected. Has been away from work upwards of 12 months.	Tall, thin, flushed countenance, large pupils, very phthisical looking. Suffers from night perspirations.	- - -	He complains of a dry hard cough and expectoration of thick and heavy matter. Respirations short and quick; some deficiency of resonance on percussion at the right apex and chest, elsewhere morbidly resonant, and inspiration harsh and expiration prolonged. Bronchial respiration and cough res. at right apex.	Pulse not much quickened.	Bowels much relaxed and have been so for some time.	
His health began to fail 2½ or 3 years ago with beating at the heart and bad breath, but he had no cough or spitting. He was working at the time at North Crofty at 160 under the adit. He first felt the palpitation 15 or 16 months ago when "beating the borer," he also felt it in coming up the ladders, he had to come up about 190 fathoms and used to stop about twice in coming up and was very much out of breath, and his heart beat violently at the time. His present illness commenced with swelling of the ancles and increased palpitation, and he has not been able to do any work for 6 months. The immediate cause of his illness he however thinks was cold taken in walking through the rain from the shaft at North Wheal Crofty to the changing house, a distance of 200 yards.	Face flushed and lips livid, extremities cold, livid, œdematous.	- - -	Respirations short and hurried, and respiratory sounds very feeble.	Cardiac dulness considerably extended. Loud systolic murmur, heard most intensely at the apex and followed by a ringing second sound. Pulse very feeble.	- - -	Is not aware that any of his relatives died of heart disease.
He ascribes his illness to having got cold when underground only 2 or 3 fathoms. He changed his clothes all but his flannel, and thinks he got a chill on coming to the surface from his flannel being wet, he has been suffering ever since. Worked very hard while a miner.	Dark complexioned, sallow, and lips very livid, voice husky. He complains of night perspirations.	- - -	Pleuritic effusion on right side, large cavern at right apex.	Pulse small, quick and feeble	Bowels at present regular, but he has suffered from diarrhœa.	His habits have always been regular, and he has got a sufficiency of food. This patient has since died.
He enjoyed good health till after last Christmas when his health failed, as he thinks from having been doing very badly and consequently he could not get sufficient to live upon. The air was light but not bad, the candles would burn well enough, he continued to work till 5 months ago, when he was taken with pain in the bowels, and the food lay heavy at his stomach, and he vomited sometimes; he gave up and was at home for 3 months; lately he has been suffering from "slow fever," he has several times tried to work but cannot go on, and is extremely weak, but for the last 2 weeks has been able to go about a little.	Pale, very sallow and extremely languid looking, icteroid tinging of conjunctivæ, pains in the loins. He complains of burning in the palms of the hands and in the soles of the feet, along the limbs and at the top of the head; he feels weary and cannot sleep well, and when he awakes is not refreshed by the sleep he gets, and feels worse on rising than when he went to bed, he feels better some days than others, but without any regularity.	No headache	No cough or expectoration except in the morning, and no difficulty of breathing; has pains about the chest, especially at night, respirations 32, percussion and respiratory sounds natural.	Fluttering at the heart; pulse feeble 72, heart sounds flat.	Very little appetite and the food does not agree, lying heavy and being sometimes vomited and followed by pain in the stomach; bowels confined, only acted upon by medicine; tongue red at the tip and dorsum and furred at the back, very offensive breath, some tenderness to the touch at the lower part of the right side in the region of the liver.	

District, Date, and Disease.	Present Age.	FAMILY HISTORY. Ages, occupations, state of health, and cause of death of brothers.	Age, occupation, &c. of father.	Ages, occupations, &c. of other relatives.	PERSONAL. Age at which he first worked underground.	In what mines he has worked, kind of work, and character of air.
31. Par, July 19, 1862; Palpitation.	27	- - -	- - -	- - -	At about 15	Has worked at tribute, chiefly at Fowey Consols.
32. Par, July 19, 1862; marked Miners' Asthma and debility.	53	A brother, a miner, died at 58, another also a miner, at 50, and a third is living but very ill at 50.	Father, a miner, was killed at 41.	Grandfather was a miner and lived to 70.	At 16, and worked for 42 years.	Chiefly at tribute and in very warm mines, the air light and the workings very dusty.
33. Par, July 19, 1862; Palpitation and general debility, worn out.	62	Of 5 brothers all were miners and died at 58, 56, 54, 50, and 40.	Father a miner, and died at 62 of miner's asthma.	Mother died of decline at 62, 1 sister living at 70, 3 sisters died 61, 58 & 28; the last died in childbirth.	At 10 and did boy's work till 15 after which he worked as full miner for 37 years.	He has worked at tribute nearly all his time, when his health failed he was working at 160 fathoms from adit, and in a warm, dry, and dusty place; he worked 12 years in the last mine.
34. Par, July 19, 1862; Phthisis, predisposition not ascertained.	33	Two brothers living, one a soldier, the other a miner.	Father a miner, living and healthy, but was not bred to it.	Grandfather was a farmer and died an old man. One sister living.	At 10 and worked 21 years.	He has worked for the last 14 years at the Fowey Consols, and has worked in poor air where the candles would not burn, and in places that were very hot.
35. Camborne, July 1862, August 10 1862; marked Miners' Asthma. Victoria Park Hospital.	27	- - -	Father, miner, died of consumption at about 50, he being the only member of his family who was a miner.	4 uncles, none of whom are miners, are alive, from 30 to 40 years of age. Grandfather was a miner and worked till he met with an accident by which he was killed when nearly 70.	10 or 11, and was first employed in "washing" for his father.	Worked first at Tin Croft for about 7 years, and was a tributer, and worked in good air. He then went to Condurrow and worked there about a year at tutwork, and suffered from "cold damp" and poor air. Then he went to Great Wheal Seaton and worked both at tutwork and tribute a long way from the shaft and 130 fathoms from surface. The candles would not burn at all, except by continually picking out the wick with a pin and putting the candle on the side when there was smoke enough to choke them; sometimes they would go out entirely, and they could only see by putting the candles 2 or 3 feet behind them. He worked there for 4 years; from 6 to 12 months before he gave up, began to suffer. He had pains in the heart and shortness of breath, especially felt in climbing the ladders and beating the borer; then beating at the heart increased on exertion, weakness in the legs and pains in the calves, pain in the head, sickness at the stomach, and an entire loss of appetite. He also could not sleep at night, and felt heavy and stupid in the morning and more tired than when he went to bed at night. These symptoms have continued more or less ever since, but he is better than he was.

HISTORY.	PRESENT STATE.					
Duration and assigned cause of illness.	General condition.	Nervous system.	Respiratory organs.	Circulatory organs.	Digestive organs.	Remarks.
Was well till after he had worked 5 or 6 years, when after working in damp and poor air, 38 fathoms from adit, his health failed, and after 3 years he had to give up; he suffered from beating at the heart, pain at chest, and could not climb the ladders; he was away 2 years, got better, and has returned to work a year ago, but still suffers.	- - -	- - -	Shortness of breath, but the respiratory sounds are natural.	Suffers from palpitation, no murmur.	- - -	
Enjoyed good health till 12 years ago, when he was laid by for a month; after that he resumed his work and continued at it till 8 years ago, when he again failed and was away 2 years, and then again returned; he has been now laid by 2 months, and ascribes his illness to hard work, and especially to having worked in a cold damp mine in the granite, after having been in a warm one in the killas; he also says the climbing the ladders injured him; he is getting gradually worse, and suffers especially in winter.	Pale and anxious expression of countenance, extremities cold.	Complains much of want of sleep at night.	Respirations 24, loud and prolonged respy. sounds and sonorous rh. in all parts, very little movement, res. on per. morbidly clear; cough violent and much expectoration but never of blood; his difficulty of breathing and other symptoms are aggravated in paroxysms.	Pulse 92, feeble, heart's sounds very feeble.	Appetite and digestion very bad, bowels regular.	
Worn out by prolonged work, and recently has had to give up work.	- - -	- - -	Breathing and respiratory sounds fair.	Palpitation, heart's sounds somewhat harsh and prolonged.	- -	Is allowed by the parish 2*s.* per week, and has no other means of support.
Has been incapable of work since Christmas, lost his voice about 18 months ago, and his health failed before that; he suffered from shortness of breath; ascribes his illness to working in poor air and hot places.	Has lost much flesh and strength, and is thin, pale and phthisical looking, and very weak.	- - -	Cough and expectoration and has spat blood; consolidation at left apex, cavern at the right; voice very feeble and husky.	Heart's sounds noisy.	Appetite and digestion good, bowels relaxed.	
Unable to work for about 2 years, but ailing for a year before; and he thinks his illness was brought on by having to work in a nearly upright pitch, and with hand over hand, and in a close end; and this he did for 4 or 5 years. It was also very hot, so that he worked naked to the waist; the place was very dry, and there was "a terrible lot of dust and no air at all."	Dark complexioned, dark hair, and grey eyes; somewhat small and spare. Throat red and relaxed. Height 5.9½ Weight 9.10½ Suffers from night perspirations.	No complaint	Not at present any cough or expectoration, but suffers from shortness of breath, pains across the chest, and has spat much blood. Respirations 32. Chest narrow, very little movement, vocal thrill somewhat defective on left side. Undue sensitiveness to touch. Sparingly resonant on percussion in all parts. Respiratory sounds feeble, but without rhonchus. No undue cough resonance.	Pulse at wrist and sounds of heart feeble, 112. Palpitation increased on exertion.	Appetite fair and food agrees well. Has passed blood by stool. Tongue clean but white.	He states that he has chiefly lived upon bread and butter and some meat, perhaps 3 or 4 lbs. of meat per week for himself, wife, and 3 children, with milk, eggs, and cabbage. He sometimes takes ale or porter, about 5 or 6 pints per month, but never spirit; he does not smoke much. He also gets fish occasionally.

District, Date, and Disease.	Present Age.	FAMILY HISTORY. Ages, occupations, state of health, and cause of death of brothers.	Age, occupation, &c. of father.	Ages, occupations, &c. of other relatives.	PERSONA Age at which he first worked underground.	In what mines he has worked, kind of work, and character of air.
36. Par, July 1862; commencing Phthisis. Hereditary predisposition. August 30, 1862. Victoria Park Hospital.	27	A brother working at surface, living, between 30 and 40. One brother never underground died of decline at 19.	Father a miner, died at 45 of decline.	Father's brothers never miners, and all died young. Mother's brother living, a miner, at 60, and the others lived to a good age. Mother's father was an old man when he died. A sister living between 30 and 40. Mother died of decline at 50. 3 sisters died of decline.	13, worked at stamps before.	Worked first at Pennance Wood, a tin mine, "now knocked" for 1 year. Then went to Paine Mill, a tin and copper mine, for another year, and after that went to Fowey Consols copper mine, where he has worked ever since. He has never worked in bad air, but has worked in very warm places. This was in the 240 fathom from the adit, at an end a long way from a shaft. In this place they could only wear thin shoes and a cap, and nothing on the body. He has also worked in a very hot winze 180 from the adit and 20 or 30 from the draught, but the draught came from below and was warm. At this place they could only remain in half an hour, and then had to go out and throw water over themselves There were other workings in the mine, as a winze driven off from Buddlas shaft, in which it was so hot that the people working could not remain in for more than 5 or 10 minutes at a time. The mine is dry, but not dusty. The deepest level now worked is 270, but they were working at 300, of which the ore is now exhausted.
37. Commencing Miners' Asthma. August 1862.	39	Had no brothers who grew up.	Father killed at 50, was a miner all his life. His injury was followed by abscesses in his limbs, and he gradu- fell away.	Father had no brothers; mother had two, both miners, and both died at about 40. Father's father was killed at Ding Dong at an early age. He was a miner all his life. Mother's father was a tin dresser and lived to upwards of 70. Has 2 sisters aged 45 and 38.	At 12, and was occupied as a "roller" till 16, and then became a full miner.	Worked at tribute at Darlington 9 years, copper. Then at Wheal Margaret 2 years, tin. Then at Wheal Reeth Consols, tin. He now works there at the 140 fathom level. Generally has had good air, but has worked in some close places.
38. Mesenteric disease - August 1862.	17	- - -	Father living at 42, a "shaft man," ailing.	Mother's brothers all living and healthy. Father's only brother was a miner, and died at 36 of miners' disease, having been ill 7 years. One uncle, miner, killed. Mother's grandfather miner and died about 70. Mother living and healthy. Mother's sisters all living.	At 14, assisted his father.	Wendron Consols, tin, 25 fathoms. Crahe Downs.
39. Halwin; advanced Miners' Asthma. August 1862.	58	One brother, a miner, died at 56; ailing for some time, and died worn out by mining.	Father miner, and lived to 80.	Several uncles miners, and all died about 50 to 60. One at 54 of miners' decline.	- - -	He first worked at Porkellis, till the mines were given up about 1825, and then went to Tresavean Gwennap, and still lived at Hallwin, Wendron, walking 4½ miles to the mine and then back. When at mine had to use ladders to 230 fathoms, and the workings were very hot.
40. Halwin; Miners' Asthma, paralysis of speech and partial paraplegia; commencing general paralysis. August 1862.	49	Had two brothers miners, both of whom were killed.	Father miner, and died at 77.	- - -	Worked first underground at 18.	Worked at Wheal Lovel (tin) 7 years; worked also at Tresavean, and had to walk 3 miles to the mine.

HISTORY.	PRESENT STATE.					
Duration and assigned cause of illness.	General condition.	Nervous system.	Respiratory organs.	Circulatory organs.	Digestive organs.	Remarks.
When taken ill he was working at tribute at 180 fathoms, and that was warm but not very hot; he wore drawers and a "dickie," and the air was good. He ascribes his illness to having taken cold from getting warm with work and then being detained in the shaft waiting for the engine to bring them to the surface when they had finished working. They might have used the ladders, but the man-holes were awkward, too small for large men. 16 weeks ill.	Thin, pale, and worn, large boned, fair complexioned; voice husky; weak, and has suffered from night sweats. Height 5 ft. 8½ in., weight 10 st. 2 lbs.	No headache or other symptoms.	Cough and expectoration, and has spat some blood. General deficiency of resonance on percussion at the upper part of chest, with some cough, resonance there.	Pulse somewhat quick and feeble, palpitation of the heart and sounds somewhat rough at apex.	Appetite and digestion good, and bowels regular. Tongue large with white fur and a transverse fissure.	
...s been ill 3 weeks, and says ...e took cold from working at grass in underground ...othing, repairing the neck of the shaft. Has always had to climb ladders.	Moderate height and spare, fair complexioned and with curly hair, thin, delicate looking. Has no pains in the limbs.	Complains of slight pains in the head occasionally.	Tightness across the chest and shortness of breath, audible wheezing, cough, and spitting. Has never had hæmoptysis; chest somewhat narrow, little movement, vocal thrill feeble, sparingly resonant; very feeble respiration.	Palpitation on climbing the ladders; action of heart feeble, sounds at apex somewhat noisy, pulse at wrist feeble, quick.	Appetite fair and digestion generally good; bowels have been confined, but are now relaxed by medicine.	
...year and five months, commenced with slow fever and symptoms of cold, cough and expectoration and perspirations at night; not been confined to bed except for a day or two at a time.	Very much emaciated.	-	No cough or expectoration now but has had. Chest contracted, deficient in res. especially above and on right side, and quite dull low down on the same side. Resp. harsh; never spat blood.	Pulse feeble and quick.	Abdomen large and tender, and pain on right side. Diarrhœa. Stools usually 3 or 4 times daily, sometimes only once. Very little appetite, digestion deficient, tongue furred.	
...rn out by hard work, ailing for several years and not able to do any work for four. Illness commenced with cough, spitting, shortness of breath, and some spitting of blood occasionally; returned to Wendron C. when the mines were re-opened, and had worked there for about 8 years before he laid by, but he was never well from before he left Tresavean, and could not have continued to work there.	Very greatly emaciated, pale and thin, old looking than his age.	Some little headache occasionally.	Difficulty of breathing and loud wheezing. Much cough and expectoration, and it is occasionally bloody. Deficiency of res. on per. at each apex, especially the left. Some cough res. there, and wheezing in all parts of the chest.	Pulse quick and feeble. Heart's action irregular and sounds flat, but no murmur.	Appetite fair, has constant diarrhœa and night sweats. Tongue clean and moist.	
...ssigned his illness to working in cold damp. ...ut has also worked in poor air 86 from adit. Ill 6 years.	Thin and pale	Intelligence somewhat impaired, and cannot talk intelligibly. Loss of power of movement to a considerable extent, and impaired sensation in lower extremities. Never any fall or fit.	Does not suffer from cough or expectoration, but has done so. Has now loud wheezing at chest and rhonchus on auscultation.	Heart's sounds and pulse very feeble; has spat blood.	Appetite and digestion fair.	Living in a very bad cottage; 2 rooms, the upper slanting to roof, 2 small windows incapable of being opened, 9 persons sleeping in the room; himself and his wife and a baby, a married daughter, son-in-law, and baby, and 2 boys nearly grown up, and a girl.

District, Date, and Disease.	Present Age.	FAMILY HISTORY. Ages, occupations, state of health, and cause of death of brothers.	Age, occupation, &c. of father.	Ages, occupations, &c. of other relatives.	PERSONAL Age at which he first worked underground.	In what mines he has worked, kind of work, and character of air.
41. Porkellis; commencing Miners' Asthma, with consolidation at upper part of chest. August 1862.	41	Seven brothers all living, of whom six are miners.	Father miner, and died at 71.	Mother 73, died.	Twelve, and entered into concern at 16.	Tresavean 21 years, and had 4 miles to walk to the mine; then Wendron Consols for between 2 and 3 years; working last at Bassett and Grylls at 40 fathoms. Tin.
42. St. Just, Mr. Searle; Albuminuria, anasarca; after syphilis, and in a man who has lived too freely. August 1862.	29	Two brothers living and healthy at 32, 25.	Father miner, and died in Cuba at an early age.	Mother's brother a miner, and alive at 60, another a tailor at between 50 and 60. Father's father died between 70 and 80, a tin dresser. Does not know anything of his mother's father. Mother living, between 60 and 70; 1 sister died young; 1 sister living at 28.	Fifteen or sixteen, working at surface before.	Worked first at Botallack and was in good health; he went then to Cuba and afterwards to Michigan. He was away 2 years and 8 months; worked in Michigan at 10 fathoms and 50 fathoms from the surface, there they only have ladders, and the air was bad; cold damp. At Botallack he worked at the 100 level under the sea, and the air also was bad. He worked last at Higher Botallack, and after 3 months took ill. The effects of the bad air were lightness of the head, bleeding at the nose, sick stomach, but no chest symptoms except shortness of breathing.
43. St. Just, Mr. Searle; slow fever, commencing Miners' Asthma, mitral valvular disease. August 1862.	38	- - -	Father day labourer, alive and healthy at 70. Mother's father a labourer, and died at 80. Does not know anything of father's father. Mother died at 68.	Father's brothers, 3; 2 miners, and all 3 died early. Mother's brothers all day labourers, and all dead.	At 9 years old went to work at grasswork, and at 13 went underground, became a tributer at 17.	Worked at Balleswidden for 17 or 18 years at tribute; had tolerably good air. Worked in poor air at Trehaney at the 80 level sinking a winze; the air was very bad and the candle would not burn, and had to give up after a month, but from the impossibility of getting the candle to burn, not that he was ill. Worked also in poor air at Balleswidden. He was working at Botallack when he got ill, at the 160; hot and dry, but not much dusty; was 1 year and 10 months at Botallack.
44. St. Just, Mr. Searle; advanced Miners' Asthma. August 1862.	63	1 brother a smith, living. 7 brothers miners; 6 died at 50, 50, 60, 66, 66, and 70, 1 living at 69.	Father, blacksmith, died at 70.	Mother died at 80.	Went underground at 15 or 16.	Worked first at Wheal Owles for 2 or 3 years, then became captain and kept a public house, still however continuing to go underground. Worked last at Levant, and there for 15 years, at 130 and 150. Had poor air in different mines, the candles would not burn and the smoke lay long in them. The air in Levant was dry, dusty, and hot.
45. Treweller Chapel; recovering from Pleuropneumonia of right lung, or from "Typhoid." August 1862.	24	- - -	- - -	- - -	12, worked before at stamps, at Levant for 2 years before.	Had poor air in Botallack at the 60 for 5 months, but did not suffer.

HISTORY.	PRESENT STATE.					
Duration and assigned cause of illness.	General condition.	Nervous system.	Respiratory organs.	Circulatory organs.	Digestive organs.	Remarks.
Ascribed illness to working in cold damp and poor air. Ailing at intervals for some time, but worse for 2 or 3 years, and now laid by.	Thin and pale, and has become more so very recently.	Headache occasionally.	Shortness of breath and cough and expectoration, never spat blood, pains across chest; chest narrow, sparingly res. especially above and on the right side, and impaired movement. Cough res. above; no rhonchus, but feeble respiration.	No palpitation, heart's action and pulse feeble, sounds of heart flat.	Appetite defective, digestion fair, but pains in stomach and bowels occasionally. Tongue clean.	
16 weeks, but ill before, and ailing for 6 years since his return from America. He assigns his attack to cold damp; the candles would not burn and the smoke of gunpowder lay in the mine. In America he worked in a Native or Amenable copper mine. Ascribes his last attack to cold taken after working in a close end; but he had when in America a syphilitic sore, and secondary symptoms occurred 6 months ago.	Very pale, dropsical in abdomen and lower extremities.	No headache	Slight shortness of breath, little cough; but before he had a severe cough and much expectoration; never had hœmoptysis. Deficiency of res. on per. in the lower and posterior part of the chest, with deficiency of respiration and subcrepitation.	Sometimes a little beating at the heart. Pulse 96 very feeble, heart displaced upwards, noisy sounds.	Appetite and digestion good, tongue clean, bowels confined, abdomen distended.	Addicted to habits of intemperance; drinking much, both spirits and beer, and smoking.
Was well till 5 weeks ago.	Complains of weakness, cannot sleep at nights, and sweats profusely; very pale and thin and feeble. Has lost much flesh recently.	No headache	Shortness of breath, cough, and expectoration, but less than before; chest narrow and contracted; vocal thrill very feeble. Very feeble inspiration and slightly prolonged expiration. Harsh breathing posteriorly. General deficiency of resonance on percussion. Can count to 20.	Perhaps a murmur at the apex of the heart, certainly the sounds somewhat prolonged. Pulse very slow, 64, and extremely feeble.	Appetite and digestion fair, but complains that he cannot get a sufficiency of nutritious food; seldom animal food; breath affected; bowels regular.	No privy to the house; altogether wretched; 1 room below and 2 above; inhabited by himself, his wife and 3 children; no drainage of any kind.
Ailing for 5 or 6 years, and gave up a year ago. Ascribed his illness to getting chilled when heated and sweating.	Thin, pale, aged, great efforts to breathe; has fallen away much in last year; rheumatic pains especially in shoulders, white hair and partly bald.	Headache -	Suffers from shortness of breathing, cough, and expectoration, worse if he takes cold; he never spat blood, but thinks he vomited some, 20 years ago. Audible wheezing, wide chest, but perfectly flat, arched back, very little movement, somewhat unduly resonant, very feeble and weak, especially on left side, where the respiration sounds are almost inaudible, expiration prolonged; counts to 12; depression above the clavicles.	Beating at heart, increased by exertion, ascending a hill, or going upstairs. Pulse very feeble but not quickened, heart sounds somewhat noisy, but action feeble.	Appetite and digestion good. never passed blood by stool, tongue white, abdomen tumid.	Acknowledged to have drank too much when a publican.
Always delicate, but laid by 3 weeks and in bed 2, now getting pretty well again. Ascribed his illness to exposure to cold when under influence of drink.	Pale and thin	Eyes glassy	Had an attack apparently of palpitation, pain in left side, shortness of breath, cough, and expectoration, but did not spit blood. Chest generally sparingly res. There is now general deficiency especially at upper parts and low down at right side, with defective breathing.	Natural -	During his illness his bowels were relaxed and confined; now has a good appetite and digestion, and bowels are regular.	Wretched cottage, 3 rooms; 8 persons living in them, including a grown son and daughter. No drainage. The man acknowledged to being addicted to habits of intemperance, drinking much ale, porter, brandy, and rum, but said he had not drunk much for 2 months before he got ill.

District, Date, and Disease.	Present Age.	FAMILY HISTORY.			PERSONAL	
		Ages, occupations, state of health, and cause of death of brothers.	Age, occupation, &c. of father.	Ages, occupations, &c. of other relatives.	Age at which he first worked underground.	In what mines he has worked, kind of work, and character of air.
46. Treweller Chapel, Hemiplegia of right side with Chronic Asthma. August 1862.	69	- - -	Father a miner and died at 82.	- - -	At 10 years of age.	Worked all his life underground till he was taken with the first fit; in bad air at Wheal Carne.
47. St. Just; Phthisis; no apparent predisposition. August 1862.	45	6 brothers all living as far as he knows, but 2 in America, all older than himself, all miners.	Father a farmer, lived to 75.	Father had 4 or 5 brothers, farmers, who lived to be between 60 and 70. Mother had no brothers. Does not know ages and occupations of grandfathers. Mother alive at 90. 1 sister living at 30, and healthy. An aunt on mother's side is living at 80.	20, at surface of mines before.	Worked for 3 or 4 years in different mines in St. Just and St. Ives parishes. For the last 25 years he has been a tin dresser and ascribes his illness to having caught cold in his work from exposure. He also thinks the arsenic with the tin and copper ores has done him harm.
48. St. Just; advanced Miners' Asthma. Paralysis agitans. August 1862.	52	- -	Father, miner, died at 41 from injury followed by chest symptoms.	Father's father was a smith and died at about 60.	At 9 years of age.	Has worked in Balleswidden and in Boscean, and has been in poor air, but has generally been in the shafts.
49. St. Just; Obstinate dyspeptic symptoms threatening organic disease. Jaundice, contracted chest, and suspicion of heart affection. August 1862.	52	- - -	Father, miner, died at 63.	Mother died at 83.	At 15 years of age.	Worked in bad air at Balleswidden 11 or 12 years ago, and then at the 70 level, had bad air also at the sea level at Park Noweth, but was then young and did not suffer, also at Wheal Cock at the 90 had bad air. Was working at Balleswidden when he was taken ill, and then had good air. When suffering from the bad air he felt difficulty in ascending the ladders, lightness of head and weakness of legs, but no shortness of breath or beating at the heart.
50. St. Just; advanced Miners' Asthma with consolidation at right apex. August 1862.	62	- - -	Fatheraminer, died at 56 of stomach complaint which continued many years, and he gave up mining and went to farming.	Mother died at 82.	At fourteen, not underground for 15 or 17 years.	Worked in Balleswidden and Crowns 30 years ago, in both had bad air; the mine was hot and there was much smoke, but he did not suffer being young. He worked last at Balleswidden, but the mine is different now, there is very good air in it.
51. St. Just; advanced Miners' Asthma. August 1862.	57	- - -	- - -	- - -	At between 9 and 10 years of age.	Worked in Balleswidden 25 years and had good air there; then went to Bosweddan, where it was very close; the candles would not burn, this was at 85 level; also he worked at bottom level which was very bad; while working in poor air he suffered from shortness of breath, weakness in body and limbs, cough, spitting and brought up black and thick spit; after ceasing to work in the close places he got better.

REFORM CLUB PALL MALL

HISTORY.	PRESENT STATE.					
Duration and assigned cause of illness.	General condition.	Nervous system.	Respiratory organs.	Circulatory organs.	Digestive organs.	Remarks.
8½ years ago had a fit brought on by cold, taken in coming home from Penzance, and was left without the use of the right side. Had another fit about 4 years ago.	- - -	- - -	Very asthmatic, wheezing in all parts of chest, and cough, and expectoration, and shortness of breath.	Heart sounds natural.		
He worked in poor air in Balleswidden, but only for a month. He has been ill for 6 months; his attack commenced with pain in right side; ascribes his illness to having taken cold from exposure after work.	Pale, thin, and emaciated, night perspiration, great debility.	Headache -	Tightness across chest, pain, cough, and expectoration, never spat blood; expectorates less than before and it is white matter, he has less cough. Dulness on percussion at upper parts of chest, especially at right apex, cav. rh. at right apex and bronchitic respiration at left apex, bronchitic rh. in other parts of chest.	No beating at heart, but quick and feeble pulse.	Defective appetite and digestion, bowels usually relaxed 3 or 4 times daily. Tongue furred.	
Had peritonitis 7 or 8 years ago and has never been well since, being laid by frequently. His present illness commenced with great shortness of breath, and that was followed by a violent cough and something seemed to break and he "brought up a large black mass, and after that a quantity of spit as black as ink," and he has continued to bring this up since.	Pale, thin, and aged looking. Paralysis agitans in head, trunk, and limbs.	No headache	Very narrow chest and very slight movement, chest somewhat dull in all parts, wheezing in all parts, subcrepitation in right mamary region, but without marked cough reson.; never spat blood.	Pulse very feeble, no palpitation, heart's action feeble but sounds noisy, especially at apex.	Appetite and digestion both very defective, bowels regular, suffers from flatulency.	
7 months; illness began with jaundice 2 years ago, and then he was in good health.	Pale and thin and old looking.	No headache	Does not complain of chest symptoms, but his chest is very narrow and contracted and deformed. There is also general deficiency of resonance on percussion, with little expansion and harsh breathing; never spat blood.	Does not complain of palpitation, but the first sound of the heart is noisy at the base, but without murmur.	Appetite defective, and his food lies heavy, and he suffers from flatulency but does not vomit. Bowels torpid. Fulness and tenderness in epigastrium, pain after eating, passes matter by stool.	
He left working underground 15 or 16 years ago being then ailing and thinking his health would not stand it any longer; he has been seriously ill 5 months and ascribes his attack to having taken cold at surface; he has latterly been a "stuff" manager at surface.	Thin, pale, and old looking.	No headache	Chest narrow, contracted, and sparingly resonant; slight vocal thrill and subcrepitation at upper part of right side and in lower dorsal regions; spat blood many years ago, but not since he came to surface; cough and expectoration.	Pulse and heart's action and sounds feeble.	Appetite and digestion impaired; bowels confined.	
Laid by 4 years; ascribed his state to general breaking up of power from hard work and poor air.	He complains of weakness and general breaking up and shortness of breath; thin, pale and old looking.	Nothing -	Shortness of breath, cough and spitting, and occasionally of black matter, ordinarily greenish and yellow, viscid and muco-purulent; contraction of chest, very little expansion, and great impairment of resonance on percussion, harsh breathing, suffers from rheumatic pains in different parts of body.	No complaint of palpitation; hearts' sounds noisy.	Tongue clean; appetite and digestion impaired; bowels variable, confined or relaxed.	

District, Date, and Disease.	Present Age.	FAMILY HISTORY.			PERSONAL	
		Ages, occupations, state of health, and cause of death of brothers.	Age, occupation, &c. of father.	Ages, occupations, &c. of other relatives.	Age at which he first worked underground.	In what mines he has worked, kind of work, and character of air.
52. St. Just; Obstinate dyspeptic symptoms, chronic inflammation or organic disease of stomach. August 1862.	61	Has two brothers living, both miners, aged 53 and 55.	Father was a miner, and died of consumption at 67.	Father's brothers were grassmen, and lived to 70 and upwards. Mother died of decline at 67; one sister living andhealthy, aged 63 or 64.	At 9 years of age; when about 20 years of age he left, and was away for about 5 years, engaged in assisting to erect a beacon on the Wolf rock.	About 15 or 16 years ago he worked in very bad air at the 20 level in St. Just United; after he had worked for some time his health failed, he became very nervous, and his food did not agree with him and he was compelled to give up working. He did not do anything for 12 months, and then did a little farming work for another 12 months, after which he again went underground, but he has never been the same man since; he last worked at Bosweddan, and had done so for 6 or 7 years before he gave up. The air was not good, but not so bad as he had been in before.
53. St. Ives, Mr. Rosewall; commencing Miners' Asthma, with consolidation at the right apex. Phthisis, hereditory predisposition. August 1862.	26	A brother living, a miner.	Father miner, died of phthisis at 51.	Father's brothers miners died at 40 and 50. Mother's brothers were all miners, and are all dead. Mother died of decline.	At18, engaged in farm work before.	First worked in Wheal Providence, tin; afterwards at W. Margery, copper; and was working in the latter when taken ill. He never worked regularly in poor air, but it was very damp where he worked; he has also worked at West and East Carradon, and was first taken ill in the bottom, which was very wet; the working was 50 fathoms from the adit, and about the same distance from the shaft.
54. St. Ives, Mr. Rosewall; advanced uncomplicated Miners' Asthma. August 1862.	61	He has 5 brothers, of whom 4 are living at 54, 56 or 57, 42 or 43, and 40. 1 died at 61.	Father, miner, died at 49 of decline, from working in poor air.	Mother died at 70.	At14, worked at stamps before.	Worked in St. Ives parish all his life and chiefly in St. Ives Consols. He worked also at Wrey Consols, and had bad air there, but did not suffer from it; at Trelyon Consols, where the air was poor, at 20 fathoms, the candle would not burn, and required to be set on one side and put behind the workmen. He was working tutwork there, but has chiefly worked at tribute, and was so employed at St. Ives Consols when taken ill.
55. St. Ives, Mr. Rosewall; commencing Miners' Asthma, with Bronchitis. August 1862.	59	- - -	Father, miner, killed at Dolcoath.	Father's brother, miner, died between 60 and 70. Mother's brother a miner, died at 70. Mother died at 91.	12, engaged in farm work before.	Worked in many different mines during his life; was in poor air in Dolcoath at the 150 where he worked 12 months; at E. Wheal Crofty at 90, 2½ years; at North Roskear at 40, 3 years. This was 30 years ago, and he did not suffer from any of them, but then went to S. Roskear at 50 from the adit, and then he suffered after working for 6 months; experienced weakness and pains in the stomach, chest, and head, but not lightness of head or shortness of breath; was ill 4 years. When taken with his present illness he was working at Wheal Margery and had tolerably good air at 70 fathoms.

HISTORY.	PRESENT STATE.					
Duration and assigned cause of illness.	General condition.	Nervous system.	Respiratory organs.	Circulatory organs.	Digestive organs.	Remarks.
His health was giving way for the last 6 or 7 years, but he has been entirely laid by for a year and a half.	Very old looking for his age; pale, thin, anxious expression of countenance; nearly confined to bed.	No complaint	He has no shortness of breathing or cough or expectoration, and there is nothing detectable in the chest.	Pulse very feeble.	For 3 months has had severe pains in the stomach and in the left side and back; the former increases on taking food, and he has vomited almost every meal and within a few minutes of the time of swallowing it. He had some dyspeptic symptoms before, he has never vomited or passed blood, the bowels are very much confined; the abdomen is somewhat full and tender in the epigastrium, shrunken elsewhere.	
Six months, but was laid by 12 months ago for 3 weeks, with cold, he however got quite well beforehispresent attack. He ascribes his illness to having taken cold from working in a very wet place, 100 fathoms from the adit and 50 from the shaft. His illness commenced with pain in the right side, shortness of breath, cough and expectoration; he has several times spat some blood and once fully a pint.	Pale and thin, and much wasted within the last year; dark complexioned, sallow; complains of great weakness in the back and loins, formerly had night perspirations, not now.	No headache	Voice husky, pain in the right side extending up to the right shoulder and across the chest. Cough during the day only slight, but severe every morning and evening; not much expectoration, at first it was black but is not so now; chest narrow and contracted and imperfectly expanded, very little movement, feeble vocal thrill, especially at left side.	Pulse 80 feeble, hearts' sounds and action very feeble; respirations 24, general deficiency of res. on percussion especially above and at right apex; very feeble respiratory sounds everywhere and especially at right apex, and with undue cough res. and the heart's sounds loudly conveyed.	Appetite and digestiongood, bowels confined, tongue clean.	
He never suffered at all from working underground, and never till his present illness from any cause except from intemperance. He ascribes his attack to having taken cold from working at the surface at Werms Downs in the wind and rain, repairing the neck of the shaft. He has been ill 12 months. Illness commenced with pain at the right side, and after 4 or 5 months cough and expectoration came on and he spat blood in considerable quantity, and he has never been well since.	Old looking, sallow, and pale, and dark complexioned. Complains of perspirations at night with fits of coughing, but generally sleeps well.	General nervous tremor, but no complaint of headache, &c.	Very great shortness of breath, cough, and expectoration, but not much, and what he spits is not now bloody. Chest narrow, contracted, and shrunken; depression above the clavicles and large veins on the chest; very little movement, and extremely feeble respiration, vocal thrill rather exaggerated, no rhonchus in any part.	Pulse 100 and feeble, reduced by digitalis, heart's action and sounds very feeble.	Appetite and digestion good, bowels regular and have been so all along.	Had worked in 150 fathom level and 200 from shaft, and it was extremely warm.
He has been ill 4 years, suffering from weakness and pains in the chest. He cannot ascribe his illness to any obvious cause, but thinks he has been breaking up from over work. He still goes underground, but gets gradually worse.	Dark complexioned, pale, aged, very evidently asthmatic.	- - -	Complains of pains across the stomach, shortness of breath, and husky cough, no hœmoptysis at present, but spat some little blood a year ago, he has not now any expectoration. Somewhat defective expansion, general deficiency of res. on percussion, and feeble respiration in all parts, with rhonchus, feeble vocal thrill.	Pulse feeble, heart's sounds feeble, cardiac pulsation visible over a large space and in the epigastrium; counts to only 9.	Appetite and digestion good, bowels confined, tongue clean.	

District, Date, and Disease.	Present Age.	FAMILY HISTORY.			PERSONAL	
		Ages, occupations, state of health, and cause of death of brothers.	Age, occupation, &c. of father.	Ages, occupations, &c. of other relatives.	Age at which he first worked underground.	In what mines he has worked, kind of work, and character of air.
56. St. Ives, Mr. Rosewall; Hypertrophy of Heart and commencing mitral valvular disease. August 1862.	56	- - -	Father worked an engine and afterwards went abroad	Father had not any brothers who were miners. Mother's brothers were miners and went to Cuba and United States, and died there. Father's father a miner, and died between 70 and 80.	At 16, worked at stamps before.	Worked in various mines, and latterly in St. Ives Consols.
57. St. Just; Miners' Asthma and general debility—worn out. August 1862.	62	- - -	- - -	- - -	At 7 years -	Has worked in various mines in St. Just parish, Wheal Owles, Levant, and Balleswidden. The latter had only one shaft then, and the air was very bad and he worked there for years. The mine is now a very good one, but this was many years ago. He worked also in Park Noweth when he was 22 years of age in repairing the shaft, and of 9 men employed with him only 3 are living; they were sinking the shaft, and below the level of the pump, and had to bring up the water in a bucket, and were constantly up to the waist in water and were much chilled.
58. Bodmin Land, Liskeard, Aug. 24, 1862; commencing Miners' Asthma.	53	- -	-	- - -	At 17; farm work before. Has chiefly worked at tribute.	Has worked for the last 15 years at South Caradon, and, except for a period of 13 months has been all along in very good air; but before that time, worked for 3½ years in East Caradon and had very bad air, and was frequently laid up for a short time in consequence. He suffered from pains flying about different parts of the body, but especially in the heart, stomach, and head, and had little appetite, and the food which he took did not agree with him; he has never been thoroughly well since that time. The mine was then a new one, and he was working a long way from the only shaft. Now they have several shafts, and the air is good.
59. Redruth, Aug. 23, 1862; general debility; Rheumatic pains; commencing Miners' Asthma.	60	-	-	-	At 17 years of age.	Worked at first in Dolcoath, where the air was rather close sometimes; has since worked at different times and in different mines, in a good deal of bad air and in cold and damp, but did not suffer much at the time for he was young. His health failed first about 10 years ago, he then had inflammation of chest and liver and fever, and became jaundiced. He went away for four years, doing some farming work, and then got better and went to West Frances, but could not do much; while there he was suddenly taken ill when underground, and has not been able to do anything since four years in February last.
60. Bodmin Land, Liskeard; commencing Miners' Asthma; dyspepsia; deafness. August 24, 1862.	45	- -	- -	- - -	At 8 years of age.	Has worked in the different mines; in those of the Caradon district for the last 7 years; 4 or 5 years ago he worked in Mark Valley for a twelvemonth, and the air was very bad.

HISTORY.	PRESENT STATE.					
Duration and assigned cause of illness.	General condition.	Nervous system.	Respiratory organs.	Circulatory organs.	Digestive organs.	Remarks.
Ailing 10 or 11 years, and was working in Consols when he first got ill. He was not working in particularly bad air, but was sinking a winze about 25 yards from a shaft. He first suffered from beating at the heart and could hear his heart beat, and any one else beside him could have heard it, the beating came on gradually, and he has not had rheumatic fever or any kind of accident. He first felt the palpitation when ascending the ladders. He drove the engine on the surface for 3 or 4 months, and then had to give up entirely.	Dark complexioned and sallow, stout, and robust looking.	- - -	Chest very flat in front, very slight respiratory movement, imperfect res. on percussion, and feeble respiration every where.	Complains of beating at the heart, weakness of stomach, and lightness of the head. Pain in the region of the heart, pulse feeble, cardiac dulness considerably extended, vibration sound with systole, but no distinct murmur.	Appetite and digestion good; bowels regular.	The two men who worked in St. Ives Consols stated that the air in the mine was generally good, but in some of the levels away from the shaft it was very close and extremely hot, so that they could not wear any clothing at all except thin trousers and boots; and some parts could hardly be worked at all. The mine is generally dry.
Knocked off work 4 years ago; ascribes his illness to having worked in very wet level.	Aged and infirm.	Nothing -	Shortness of breath, cough, and expectoration; has spat some blood; breathing attended by loud wheezing, and bronchitic rhonchi in all parts of chest. Sputum very viscid.	Heart's sounds noisy and weak, pulse feeble.	Nothing.	
Has been ailing more particularly for four years; suffering from cough, expectoration, shortness of breath, and beating at the heart; but has continued to work at the mine, though frequently laid by; now unable to work for 3 days.	Very pale and thin, and anxious looking.	No complaint.	Cough, expectoration, and shortness of breath; chest narrow and contracted, and somewhat morbidly resonant, especially on right side. Respiratory sounds very feeble, and defective movement. Never spat blood.	Beating at the heart; heart's sounds somewhat prolonged and harsh at the apex.	Appetite and digestion impaired; bowels regular.	
4 years entirely laid by. Complains of pains in the hands, wrists, knees, and ankles, and in the back and chine.	Very weak, thin, pale, very sallow, and with sunken head, and worn looking.	No complaint.	Much cough and expectoration, but has never spat blood; wheezing in all parts of chest, with forced inspiration; res. on per. somewhat too clear; does not complain of shortness of breathing.	Heart's sounds and action, and pulse at wrist feeble.	Appetite good; digestion fair; tongue furred; has passed blood frequently by stool, and has prolapsion of the rectum; bowels confined and relaxed at intervals.	
Ailing for 2 years, but still working.	Worn looking, thin, and pale.	Very deaf -	Complains of shortness of breath, and tightness across the chest; the respiratory sounds are very feeble.	Heart's sounds rough at apex.	Appetite defective.	

District, Date, and Disease.	Present Age.	FAMILY HISTORY.			PERSONAL	
		Ages, occupations, state of health, and cause of death of brothers.	Age, occupation, &c. of father.	Ages, occupations, &c. of other relatives.	Age at which he first worked underground.	In what mines he has worked, kind of work, and character of air.
61. Bodmin Land, Liskeard, August 24, 1862; commencing Miners' Asthma.	52	- - -	- - -	- - -	At 14 years of age.	Has worked in different mines. About 5 years ago worked in Wheal Wrey lead mine, and the air was "very bad," and he suffered in consequence. He has also worked in "bad air" in West Caradon, and in air which was "not good" in South Caradon; is now working at East Caradon, and the air there is not "very good"; when he worked in bad air he suffered at the chest.
62. Liskeard, August 24, 1862; advanced Miners' Asthma.	39	3 brothers living, at 46 a miner, at 36 a miner, at 27 policeman; 2 sisters living, at 50 and 42.	Father a farmer living at 72, but paralytic. Father's father died of consumption at between 40 and 50; mother's father died at 80. Father's mother died at 70; mother's mother died at 80; mother died at 71, of some chest complaint.	Father's brother a farmer living at 60, but somewhat delicate; mother's brother a smith, suffers from asthma.	At 20; was employed in farm-work before.	Worked at different mines in the neighbourhood of Liskeard, both copper, iron, and lead. Worked last in West Caradon, and had done so for 5 years, when he became too ill to go on, after having been ailing for 2 years. He has chiefly worked at tribute, and has worked in some bad air. He felt the effects of the bad air in the chest and bowels; he had shortness of breath, pain in the left breast, cough, and frothy expectoration. His appetite and digestion were impaired, and he had pains in the head, and loss of power in the limbs.
63. Liskeard, August 24, 1862; Miners' Asthma and Consumption.	28	A brother a mine agent, living at 36.	Father miner died at 60; was injured by a fall, and gradually fell away afterwards.	Father's brother living at 75, a clerk at a mine; another brother died from drinking. Died about 70 years of age. Never had any sister; mother living at 73 and healthy.	16	Worked for 5 years in the Bedford United, and did not suffer at all till 2 or 3 months before he left. He was then working in a "rise" where the air was very bad; the candle would not burn unless it was held on one side; it was 12 fathoms below the adit, and that was at a depth of 15 fathoms, and the "rise" was very far from the shaft. Of 4 men who worked with him, 1 broke down in about a week; 2 others in about 2 weeks, but the fourth and himself stood it out, though they had to be away for a day or two. The work was completed in about a month, but he and another have never been able to do anything since, underground.

HISTORY.	PRESENT STATE.					
Duration and assigned cause of illness.	General condition.	Nervous system.	Respiratory organs.	Circulatory organs.	Digestive organs.	Remarks.
He is still going to mine, but has been ailing for the last two years, and ascribes his illness to having worked in foul air.	Very aged looking, gray, and somewhat bald; pale, thin, and with a stooping gait.	Suffers occasionally from headache.	Complains of cough and expectoration, but has never spat blood. Has also shortness of breathing; chest narrow, contracted, and unduly resonant in some degree. Respiratory sounds harsh.	Heart's sounds feeble; pulse slow and very feeble.	Appetite and digestion defective; bowels regular.	
He has been ailing for several years. He first felt weakness in his limbs in climbing, and got so ill that he was not able to go underground, and remained at surface, acting as an agent. He then after 3½ years got better, and went underground for a year, when he became too ill to work; has not been underground now for 4 years, or able to do anything.	Dark complexioned, and very sallow. Complains of being very weak, and is thin and worn looking, with an anxious countenance; voice husky. Had formerly night perspirations, but does not suffer at present.	No complaint.	Complains of shortness of breathing, cough, and expectoration, and has several times spat blood; he is better now than he was when he first gave up, and than he is in cold and damp weather. Respirations 20; counts to 6 or 8. Chest rounded, and the intercostal spaces filled out; res. on per. unduly clear; very little movement; great effort made to fill the chest, with little effect; wheezing in all parts of chest.	Heart's sounds noisy, but without murmur; no material palpitation; pulse 84, jarring.	Appetite and digestion impaired; bowels confined.	
He has not been underground for 7 years, and ascribes his illness to having worked in bad air. Its effects commenced with headache, loss of appetite, wasting, weakness and pains in the limbs and swelling of one ankle; he also spat blood and phlegm since he went underground. He has been a watchmaker and jeweller, and has kept a school, but got so ill last winter, that he had to give up all work. Thinks he took cold from putting on a damp shirt, after working.	Very nervous and weak; suffered much from night perspirations in the spring, but is better in that respect now; pupils large; he cannot work from shortness of breath.	No complaint.	Not much cough, but has expectoration, and occasionally of blood; pain in the left breast; chest moderately expanded, but flat above; fairly res. on per.; respiration feeble above, harsh below, both before and behind; never spat much blood at a time; counts to 16 or 20.	Pulse somewhat quick and feeble; heart's sounds noisy.	Appetite and digestion good, and bowels regular; tongue clean.	

DISEASES OF MINERS IMPERFECTLY REPORTED.

Age of miner.	At what age he began to work underground, and previous occupation, if any.	How many years he worked underground.	Whether he chiefly worked at tribute or tutwork.	History.	Nature of illness and general condition.
58	1. 18	- - -	- - -	Gave up working from ill health, about 28 years ago, and has worked at surface since.	He suffered from palpitation, and for 3 years was not able to do anything, he then got better and was able to do light work at the surface, but suffers at intervals. He also complains of pains and tenderness in his legs. Resonance on percussion impaired, but respiration fair; heart's sounds noisy but without murmur. Dark complexioned, fairly nourished.
	Dolcoath, July 13, 1862. Palpitation, dyspnœa.				
38	2. 18	- - -	- - -	Worked underground till 4 months ago, and then gave up from his health failing.	Complains of pains in the front of the chest and the surface is tender to the touch; pain and weakness also in the loins; some deficiency of resonance on percussion at right apex, with feeble breathing and cough; res. there. Heart's sounds noisy but without murmur, pulse feeble and quick. Thin, pale, sallow, anxious, and phthisical looking, eyes glassy.
	Dolcoath. July 13. Phthisis.				
57	3. 17	- - -	- - -	Still going underground.	3 years ago had dropsy and swelling of the limbs and was laid by for 3 months; he still suffers from weakness in the loins and thighs, but has a strong arm and is able to work. Heart's sounds noisy, pulse quick and weak.
	Dolcoath, July 13. Formerly Albuminuria and Dropsy.				
45	4. 30	- - -	Shaftman working in wet and draughty places.	- - -	Suffering from rheumatic pains in loins and right side of chest, respiratory sounds feeble, some prolongation of systolic sound at apex of heart.
	Camborne. Rheumatism.				
35	5. 18	17	Working at tribute at Balleswidden.	- - -	Psoriasis.
	In Truro infirmary.				
22	6. 15	- - -	Worked 4 years underground, and then had his arm broken by a fall of ground and was much crushed in the body. Since that he has had spitting of blood and has not been able to do anything for the last 3 years.	Weak and suffering at the chest, especially from palpitation.	There is some deficiency of the resonance on percussion at the right apex, but no undue cough or vocal resonance. He has considerable palpitation, and the heart's sounds are noisy. Sallow and thin.
	Camborne, July 15, Dr. Harris. Effects of injury.				
32	7. 11	- - -	Tutwork - -	Suffering from palpitation.	Has had 2 attacks of "slow fever," one 5 years, the other 6 months ago; chest full and rounded and respiration harsh; heart's sounds feeble; has not spat blood. Pale and thin.
	Clifford and United, Aug. 23, 1862. Commencing Miners' Asthma.				
35	8. 10	- - -	Both - -	Spat some blood at Christmas.	Complains of pain in the side, shortness of breath, and beating at the heart, has no cough or murmur. Pale and thin.
	Clifford and United, Aug. 23, 1862. Commencing Miners' Asthma or Phthisis.				
44	9. 15	- - -	Tutwork - -	Had typhus fever 10 years ago, has suffered for 3 or 4 months from cough and spitting, but has never spat blood, or suffered from palpitation.	Very worn and ill looking; breathing harsh.
	Clifford and United, Aug. 23, 1862. Commencing Miners' Asthma.				
44	10. 15	10	Tribute. Worked in foul air in Kea Park (the candles would not burn), and got a chill followed by rheumatic fever, and has not been able to go underground since, now 19 years ago. Is now working at surface.	Has suffered since he had rheumatic fever at the chest, and still does so severely, occasionally.	Breathing short and very feeble respiratory sounds; cough, but not much expectoration; sounds and action of heart feeble, and pulse at the wrist also feeble. Appetite and digestion good, and bowels regular.
	Clifford and United Mines, Aug. 23. Miners' Asthma.				

Age of miner.	At what age he began to work underground, and previous occupation, if any.	How many years he worked underground.	Whether he chiefly worked at tribute or tutwork.	History.	Nature of illness and general condition.
	11.				
38	12	22	Had a bad hurt 3 years ago, his thigh being broken and his head cut, and has never been well since.	Now suffers from weakness and pains in the back and limbs.	
Clifford and United Mines, Aug. 23. Effects of injury.					
	12.				
44	17 working at surface before.	27	Both tutwork and tribute, about equally.	Ailing, but still working; had inflammation of lungs 2 or 3 years ago.	Pains about the chest and beating at the heart, especially felt on exertion; harsh respiratory sounds; some prolongation of first sounds of heart at apex, perhaps a murmur.
Clifford and United Mines, Aug. 23. Palpitation, dilatation of heart.					
	13.				
39	14 stamps before.	25	Chiefly tribute -	Ailing and unable to work for 4 months.	Two years ago, when working with a pick, he over reached himself and felt something give way on the right side of the chest, and brought up about a pint and a half of blood, and has suffered ever since. Complains of shortness of breath, cough, and expectoration. At the time the hæmoptysis occurred he was away for a week; and again a year ago he was laid by; has now been unable to work for 4 months. No marked signs of pulmonary or cardiac disease.
Clifford and United Mines, Aug. 23. Commencing Miners' Asthma.					
	14.				
51	16	35	Tutwork chiefly -	Caught cold from working in warm places and then going into cold places. Has been laid by for 3 weeks.	Complains of cough and spitting, but has never spat any blood, and has no palpitation of the heart. General deficiency of the resonance on percussion at the upper part of the chest, with feeble respiratory sounds; heart's action and sounds feeble, and pulse at the wrist feeble. He is very deaf.
Clifford and United Mines, Aug. 23. Miners' Asthma.					
	15.				
44	18 surface before.	26	Tribute - -	Fell away 24 feet 7 months ago, and was severely hurt in the head and back; has not been able to work since; was quite well before.	Heart's sounds noisy and harsh; very weak in the back, stooping gait, walks with feeble step; no appearance of injury to spine, and no loss of sensation in lower extremities.
Clifford and United Mines, Aug. 23. Partial Paraplegia from injury.					
	16.				
46	12 - - -		- - -	Working at surface for 15 or 16 months.	Suffers from weakness in the stomach, expectoration and cough; the expectoration is especially in the morning and is frothy; has never spat any blood. Tongue morbidly red, appetite defective, digestion fair, bowels regular; some palpitation; respiratory and percussion sounds impaired, especially at left side; heart's sounds feeble. Sallow and spare.
Dolcoath, July 13. Miners' Asthma and Dyspepsia.					
	17.				
52	14 - - - -		- -	At surface for the last 10 months.	Very readily takes cold and suffers from shortness of breath, cough, and expectoration; on palpitation, appetite and digestion delicate, bowels confined; feeble respiration, and resonance on percussion somewhat unduly clear; heart's sounds and pulse feeble. Sallow and spare.
Dolcoath, July 13. Miners' Asthma and general debility.					
	18.				
28	14 - - -		- -	At surface for last 7 months.	Two years ago took cold from working in water, and had typhus fever, and has never been well since. Suffers from shortness of breathing, cough, and expectoration of dark matter, but never of blood; appetite and digestion fair, but bowels relaxed; pulse small, feeble, and quick; resonance on percussion impaired at each apex and harsh, and with undue cough, res., especially at right. Thin and sallow.
Dolcoath, July 13. Threatened Phthisis, diarrhœa, debility.					
	19.				
16	13 - - -		Rolling and assisting the men.	- - -	Eruption of psoriasis on all parts of body.
Calvadnack, Psoriasis.					

MINERS AT WORK AT WENDRON CONSOLS MINE, 18th AUGUST 1862.

Age.	At what age he began to work underground.	How many years he worked underground.	What he chiefly worked at, Tribute or Tutwork.	Has he had any illness and of what character.	Condition and Appearance.
34	16	18	Both	Has had nothing serious the matter with him since he worked underground.	Healthy looking, but sallow and pale.
41	16	25	Tutwork	Nothing	Healthy.
26	16	10	Both	Nothing	Healthy.
21	13 full man's work at 16 or 17.	8	Tutwork	Nothing	Healthy.
23	14	9	Both	Nothing	Healthy.
21	17	4	Tutwork	Nothing	Healthy.
20	13 full man's work at 18 and grass work 2 years.	7	Tutwork	Complains of shortness of breathing and cough.	Delicate looking.
37	25 farm work before.	12	Both	Nothing	Healthy.
25	13 man's work at 15.	12	Tutwork	Complains of dyspeptic symptoms.	Thin, but fairly healthy.
19	15 man's work at 16.	4	Tutwork	Nothing	Healthy, but thin.
30	16 man's work 17.	14	Both	Had typhus in 1857	Thin, but fairly healthy.
